(AD-A267197; AFOSR-93-0460TR) Avail: CASI HC A12/MF A03

A common assumption in environmental toxicology is that after the initial impact, ecosystems recover to resemble the control state. This assumption may be based more on our inability to observe an ecosystem with sufficient resolution to detect differences than reality. Recent findings of complex and perhaps chaotic dynamics in two relatively simple types of microcosms demonstrate that complex dynamics and nonequilibrium systems are the rule rather than the exception. In the Standardized Aquatic Microcosm and the Mixed Flask Culture (MFC) microcosms, multivariate analysis and clustering methods derived from artificial intelligence research was able to differentiate oscillations that separate the treatments from the reference group, followed by what would normally appear as recovery, followed by another separation into treatment groups as distinct from the reference treatment. The explanation may be that the oscillations are the result of the intrinsic chaotic behavior of population interactions, of which the alteration of detrital quality is but one of many. In fact, preliminary data indicate that material derived from the jet fuel may be released back into the water column due to the decay of organic material. The initial impact of the toxicant re-set the dosed communities into different regions of the n-dimensional space where recovery may be an illusion due to the incidental overlap of the oscillation trajectories occurring along a few axes. AN ASSESSMENT OF ACID FOG

F. W. Lipfert 1992 11 p Presented at the International Symposium on Measurement of Toxic and Related Air Pollutants, Durham, NC, 4-8 May 1992

(Contract DE-AC02-76CH-00016)

(DE93-009347; BNL-48499; CONF-920556-1) Avail: CASI HC A03/MF A01

Airborne particles have long been associated with adverse effects on public health beginning with the notorious air pollution disasters of several decades ago. Although H2SO4 was identified early on as a potential causal factor during these episodes (in part because of fog), concern for potential health effects of particle acidity per se has intensified only recently. Most of the recent aerometric research in the U.S. on acid fog has focused on the ability of clouds and fog to deliver acidity to vegetation and ecosystems. Strong acids are characterized chemically by their pH or H(+) concentration. For fog, concentrations are referred to the droplet liquid content; for other (i.e., 'clear air') aerosols, concentrations are referred to the volume of air sampled. A useful measure of the relationship between aerosol and fog is obtained by comparing their mass concentrations on the basis of the same volume of air, by multiplying fogwater concentrations by liquid water content (LWC). This paper reviews fog measurement capability, physical properties and chemistry, and presents a simple urban airshed model which is used to simulate the evolution of fog and aerosol concentrations under urban stagnation conditions. NEW YORK MARKAL: AN EVALUATION OF CARBON DIOXIDE EMISSION CONTROL STRATEGIES IN NEW YORK STATE

L. D. Hamilton 1992 11 p Presented at the International CHALLENGE Symposium, Laxenburg, Austria, 30-31 Jan. 1992

(Contract DE-AC02-76CH-00016)

(DE93-013149; BNL-48755; CONF-9201150-1) Avail: CASI HC A03/MF A01

A MARKAL model was developed for the State of New York. It represents the State's energy system as a set of typical technologies for generating, converting, and using energy as it evolves over a 45-year period. NYMARKAL was applied here in demonstration analyses to explore strategies to reduce CO2 emissions. NYMARKAL was installed at the State Energy Office and in the Offices of the New York Power Pool. Example scenarios showed that it is more difficult and more expensive to reduce carbon emissions in New York State than in the United States as a whole. Were a common carbon tax instituted, it would have less effect in New York and most carbon emissions reduction would take place elsewhere in the country where it is more cost-effective. Alternatively, were all states required to reduce CO2 emission an equal percentage (say by 20%), the cost per unit emissions reduction to New York would be much greater than in the rest of the country. STATEMENT ON GLOBAL CLIMATE CHANGE BEFORE THE SUBCOMMITTEE ON ENERGY AND POWER, UNITED STATES HOUSE OF REPRESENTATIVES

J. A. Edmonds Apr. 1993 9 p

(Contract DE-AC06-76RL-01830)

(DE93-013163; PNL-SA-22080) Avail: CASI HC A02/MF A01

Greenhouse gases are gases which are effectively transparent to incoming sunlight but absorb infrared radiation escaping to space and thereby warm the surface of the Earth. Human activities result in the release of greenhouse and related gases in such quantities that they are changing the composition of the atmosphere. Greenhouse and related gases which human activities release include carbon dioxide (CO2), methane

(CH4), carbon monoxide (CO), nitrous oxide (N2O), nitrogen oxides (NO(x)), chlorofluorocarbons (CFCs) and sulphur dioxide (SO2). The emission and effects of these gases are detailed in this report. DOE

APPLICATION OF NON-THERMAL PLASMAS TO POLLUTION CONTROL
B. M. Penetrante, G. E. Vogtlin, J. N. Bardsley, P. A. Vitello, and P. H. Wallman Jun. 1993 11 p Presented at the 2nd International Plasma Symposium on World Progress in Plasma Applications, Palo Alto, CA, 9-11 Feb. 1993
(Contract W-7405-eng-48)
(DE93-016432; UCRL-JC-112689-Rev-1; CONF-930256-1-Rev-1) Avail: CASI HC A03/MF A01

Non-thermal plasma techniques can be used to destroy many types of hazardous molecules. They are particularly efficient when the toxic materials are present in very small concentrations. This paper discusses three particular applications of non-thermal plasmas: decomposition of hydrogen sulfide (H2S), removal of trichloro ethylene (TCE), and removal of nitrogen oxides (NO(x)). Emphasis is placed on the energy cost for implementing the decomposition or removal of these pollutants. Some of the factors affecting the energy cost are discussed. The authors discuss in detail their work at LLNL on pulsed plasma processing for the treatment of NO(x) in diesel engine exhaust. The results suggest that their plasma reactor can remove up to 70% of NO with relatively high initial concentrations (up to 500 ppM) at a power consumption cost of 2.5% for an engine with an output of 14 kW and an exhaust gas flow rate of 1,200 liters per minute. COMPLEX TERRAIN WIND MODEL EVALUATION Final Report
Martin E. Lee Jun. 1993 169 p
(AD-A266467; ARL-TR-54) Avail: CASI HC A08/MF A02

The Winds on Critical Steamline Surfaces (WOCSS) complex terrain wind flow model is designed to simulate lateral, mechanical forcing effects on air flows along elevated, solid boundaries. These effects exert significant influence on observed flow field properties, such as transport and diffusion. The degree to which WOCSS model outputs are more reliable than a basic mass consistency model (that does not address lateral forcing dynamics in complex terrain) is discussed in terms of statistical and spatial results, and conclusions regarding this comparison are presented. Results indicate that the WOCSS model does not predict directional changes resulting from lateral forcing, which is a serious limiting factor in its potential application. The WOCSS model was also found to have an oversimplified mass consistency algorithm, averaging speed-up effects over the entire lateral free-flow surface, which restricts prediction of localized lateral speed-up effects in the vicinity of mechanical flow obstacles. Finally, the WOCSS model tends to over-predict the quantity of flow restricted space under both stable and unstable conditions in the transition from moderate to rugged complex terrain when wind speeds are generally less than or equal to 4.0 m/s. However, despite the observed WOCSS model limitations, the WOCSS model did demonstrate the potential to selectivity predict reasonable and significant dynamic lateral forcing spaces over a variety of terrain and stability conditions. THE USE OF GENERAL CIRCULATION MODELS IN DETECTING CLIMATE CHANGE INDUCED BY GREENHOUSE GASES
B. D. Santer, U. Cubasch (Deutsches Klimarechenzentrum G.m.b.H., Hamburg, Germany.), U. Mikolajewicz (Max-Planck-Inst. fuer Meteorologie, Hamburg, Germany.), and G. Hegerl (Max-Planck-Inst. fuer Meteorologie, Hamburg, Germany.) Mar. 1993 32 p
(Contract W-7405-eng-48)
(DE93-014369; UCRL-ID-113627; PCMDI-10) Avail: CASI HC A03/MF A01

This article reviews some problems associated with the use of coupled atmosphere-ocean General Circulation Models (GCM's) in studies which attempt to detect a greenhouse-gas-induced signal in observed climate records. We show that model uncertainties affect both our predictions of how climate might change in response to greenhouse-gas (GHG) changes and our estimates of the decadal- to century-time scale natural variability properties of the climate system. Knowledge of the latter are essential in order to make meaningful statements about when and even whether we could expect to detect a greenhouse-gas signal. We show that GHG signal uncertainties are associated with errors in simulating the current climate in uncoupled and coupled climate models, the possible omission of relevant feedbacks, the non-uniqueness of the signal (due to the twin problems of the model's internally-generated natural variability and its sensitivity to initial conditions), uncertainties regarding the future GHG forcing and atmospheric GHG concentrations, and the so-called 'cold start' error. Results from recent time-dependent greenhouse warming experiments are used to illustrate some of these points. We then discuss how energy-balance models, stochastic-forced ocean GCM's, and fully-coupled atmosphere-ocean GCM's have been used to derive estimates of decadal- to century-time scale natural variability, and consider some of the uncertainties associated with these estimates. This review illustrates that it will be necessary to reduce both model signal and model natural variability uncertainties in order to detect a climate change signal and attribute this convincingly to changes in CO2 and other greenhouse gases. A collaborative research program was initiated to study the emissions of a wide variety of chemical species from stationary combustion systems. These product species have been included in the Clean Air Act legislation and their emissions must be rigidly controlled, but there is a need for much better understanding of the physical and chemical mechanisms that produce and consume them. We are using numerical modeling to study the chemical reactions and fluid mechanical factors that occur in industrial processes: we are examining systems including premixed and diffusion flames, stirred reactors and plug flow reactors in these modeling studies to establish the major factors leading to emissions of these chemicals. In addition, we are applying advanced laser diagnostic techniques to validate the model predictions and to study the possibilities of developing sophisticated sensors to detect emissions of undesirable species in real time. This paper will discuss the organization of this collaborative effort and its results to date. DOE

INCORPORATING GLOBAL WARMING RISKS IN POWER SECTOR PLANNING. VOLUME 1: A CASE STUDY OF THE NEW ENGLAND REGION
F. Krause, J. Busch, and J. Koomey Nov. 1992 127 p
(Contract DE-AC03-76SF-00098)
(DE93-015241; LBL-30797-Vol-1) Avail: CASI HC A07/MF A02

Growing international concern over the threat of global climate change has led to proposals to buy insurance against this threat by reducing

emissions of carbon (short for carbon dioxide) and other greenhouse gases below current levels. Concern over these and other, non-climatic environmental effects of electricity generation has led a number of states to adopt or explore new mechanisms for incorporating environmental externalities in utility resource planning. For example, the New York and Massachusetts utility commissions have adopted monetized surcharges (or adders) to induce emission reductions of federally regulated air pollutants (notably, SO(sub 2), NO(sub x), and particulates) beyond federally mandated levels. These regulations also include preliminary estimates of the cost of reducing carbon emissions, for which no federal regulations exist at this time. Within New England, regulators and utilities have also held several workshops and meetings to discuss alternative methods of incorporating externalities as well as the feasibility of regional approaches. This study examines the potential for reduced carbon emissions in the New England power sector as well as the cost and rate impacts of two policy approaches: environmental externality surcharges and a target- based approach. We analyze the following questions: Does New England have sufficient low-carbon resources to achieve significant reductions (10% to 20% below current levels) in fossil carbon emissions in its utility sector? What reductions could be achieved at a maximum? What is the expected cost of carbon reductions as a function of the reduction goal? How would carbon reduction strategies affect electricity rates? How effective are environmental externality cost surcharges as an instrument in bringing about carbon reductions? To what extent could the minimization of total electricity costs alone result in carbon reductions relative to conventional resource plans?. DOE

A GEOGRAPHIC INFORMATION SYSTEM APPROACH TO MODELING NUTRIENT AND SEDIMENT TRANSPORT
Daniel A. Levine (Automated Sciences Group, Inc., Oak Ridge, TN.), Carolyn T. Hunsaker, John J. Beauchamp, and Sidey P. Timmins (Analysas Corp., Oak Ridge, TN.) Feb. 1993 177 p
(Contract DE-AC05-84OR-21400)
(DE93-013747; ORNL-6736) Avail: CASI HC A09/MF A02

The objective of this study was to develop a water quality model to quantify nonpoint-source (NPS) pollution that uses a geographic information system (GIS) to link statistical modeling of nutrient and sediment delivery with the spatial arrangement of the parameters that drive the model. The model predicts annual nutrient and sediment loading and was developed, calibrated, and tested on 12 watersheds within the Lake Ray Roberts drainage basin in north Texas. Three physiographic regions are represented by these watersheds, and model success, as measured by the accuracy of load estimates, was compared within and across these regions. DOE

Three adsorbents were evaluated for their capacity on sampling chemical warfare agents in air. The materials were Carbotrap, Chromosorb 102 and Tenax TA. After the sampling was completed the adsorbents were analyzed with thermal desorption. This means that the adsorbent is heated and at the same time flushed with gas, which leads to complete desorption on everything on the adsorbents surface. For the analysis of the adsorbents, a thermal desorption injector (Chrompack) in connection with a gas chromatogaph (Hewlett-Packard) was used. The gas chromatograph was equipped with flame ionization and nitrogen phosphorous detectors. It was shown that Tenax TA was the most suitable adsorbent for sampling and thermal desorption of organic phosphorous compounds. ESA

This is a data report on the Adirondack Teleseismic (ATA) experiment, conducted during June to November, 1992. In this experiment, five portable seismic stations were run in the Adirondack Mountains of upstate New York in order to record teleseismic body waveform in a tight array configuration. Seventy-eight regional and teleseismic earthquakes were detected by the array during its operation. The purpose of this experiment is to acquire a data set where array processing techniques can be used to enhance the signals used in a teleseismic receiver structure analysis. DTIC

An automated contour analysis of auroral images from the DESAI database is being developed. The goal is to be able to feed DESAI images to the software and let it automatically determine the inner and outer boundaries of the auroral oval of a given set of DESAI images. With these contours established, the software will determine the enclosed polar

cap area and (model based) integrated magnetic flux through that area. Through the use of this automated system, it will be possible to analyze a large fraction of the DESAI database and correlate it with various other solar-terrestrial space plasma physics parameters and indices.

MESOSCALE MODELING OF THE ATMOSPHERE Interim Report No. 9
R. P. Pearce 31 Mar. 1993 28 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DAJA45-90-C-0009)
(AD-A263236) Avail: CASI HC A03

The Naval Research Laboratory (NRL) is presently developing a non-hydrostatic mesoscale model which is suitable for forecasting meso-Beta and gamma scale phenomena over complex terrain. The model will be delivered to the Army in 1997. However, until the non-hydrostatic model becomes operational, HOTMAC (Higher Order Turbulence Model for Atmospheric Circulation) will be used as an operational model in the U.S. Army's IMETS (Integrated METeorological System) to make a short-range (up to 24 hours) forecast of battlescale atmospheric phenomena. The U.S. Army is mainly concerned with meteorological conditions spatially within the area of 500 km x 500 km x 10 km or less and temporally within the period of 24 hours or less. The Army Research Laboratory's (ARL) prototype IMETS is currently receiving the forecast and analysis fields of meteorological variables produced from the U.S. Air Force Global Spectral Model (GSM) through the Automated Weather Distribution System (AWDS). In the near future, the Relocatable Window Model (RWM) output is expected to become available. The RWM is the Air Force's regional meso-alpha model similar to the Navy Operational Regional Atmospheric Prediction System (NORAPS). The U.S. Army is planning to use the output of GSM (or RWM) to initialize and assimilate into HOTMAC. HOTMAC has been used extensively at the ARL (formerly Atmospheric Sciences Laboratory), and simulate the evolution of locally forced circulations due to surface heating and cooling over meso-Beta and gamma scale areas. HOTMAC is numerically stable and easy to use and thus, suitable for operational use. Author

A concept for the solution of data combination is developed in which the idea of robust collocation, based on a random effects model, is generalized. With the multi-hom BLUP (Best homogeneously Linear Unbiased Prediction) and mixed BLUP predictors, two approaches are presented where the influence of possible systematic errors in the data set, being interpreted as stochastic prior information, can be reduced. In order to estimate the different combination solutions a statistical test strategy was developed, which involved identity and compatibility tests. These techniques were numerically tested by means of an expansion of the Earth's gravitational potential in spherical harmonics based on terrestrial gravity data and satellite orbit information. Due to the robustification very homogenous combination solutions could be obtained using the predictors; they turn out to be superior when compared with the traditional approaches. ESA

In a companion paper, we present observational evidence that the stable, growth-phase auroral arc that intensifies at substorm expansion phase onset often forms on magnetic field lines that map to within approximately 1 to 2 R(sub e) of synchronous. The equatorial plasma pressure is 1 to 10 nPa in this region, which can give a cross-tail current greater than 0.1 A/m. In this paper, we propose that the arc is formed by a perpendicular magnetospheric-current divergence that results from a strong dawn-to-dusk directed pressure gradient in the vicinity of magnetic midnight. We estimate that the current divergence is sufficiently strong that a is greater than 1 kV field-aligned potential drop is required to maintain ionospheric-current continuity. We suggest that the azimuthal pressure gradient results from proton drifts in the vicinity of synchronous orbit that are directed nearly parallel to the cross-tail electric field. Author

[INVESTIGATE WAVE-MEAN FLOW INTERACTION AND TRANSPORT IN THE EXTRATROPICAL WINTER STRATOSPHERE] Final Report
Anne K. Smith 20 Oct. 1993 3 p
(Grant NAGw-1744)
(NASA-CR-194555; NAS 1.26:194555) Avail: CASI HC A01/MF A01

The grant supported studies using several models along with observations in order to investigate some questions of wave-mean flow interaction and transport in the extratropical winter stratosphere. A quasi-geostrophic wave model was used to investigate the possibility that resonant growth of planetary wave 2 may have played a role in the sudden stratospheric warming of February 1979. The results of the time-dependent integration support the interpretation of resonance during February, 1979. Because of the possibility that the model treatment of critical line interactions exerted a controlling influence on the atmospheric dynamics, a more accurate model was needed for wave-mean flow interaction studies. A new model was adapted from the 3-dimensional primitive equation model developed by K. Rose and G. Brasseur. In its present form the model is global, rather than hemispheric; it contains an infrared cooling algorithm and a parameterized solar heating; it has parameterized gravity wave drag; and the chemistry has been entirely revised. Tables of tidal tilts recorded by the International Center for Earth Tides (IECT) are presented. The evaluation of the data collected from 309 (245 in 1985) worldwide stations involved the comparison of the new extended tidal potentials. Great attention was given to the calibration problem of the gravimeters. IECT has continued to extend the transworld tidal gravity profiles by establishing temporary stations with geodynamics and LaCoste Romberg (zero method) gravimeters in South America and Africa. The results of the I/h ratio derived from 11 years of measurements with an Ozawa horizontal extensometer installed in the azimuth 37.8 deg south-east at Walferdange (Luxembourg) and for the vertical strain parameter obtained from 9 years registration with a 3.4 m vertical extensometer at Walferdange are given. A comparison of the results of the superconducting gravimeter with the mean of three modified (Bonatz) Azania gravimeters installed in the Walferdange mine is offered. In all these results, the hydrodynamical effects of the Earth's liquid core are clearly visible. The method of analysis is the least squares method with Venedikov filters.

A NEW FEEDBACK SYSTEM FOR INSTRUMENTS EQUIPPED WITH A CAPACITIVE TRANSDUCER **c35**

M. VanRuymbeke *In its* Papers Presented at the Eleventh International Symposium on Earth Tides 1991 p 51-60 (For primary document see N94-15800 03-46)

Copyright Avail: CASI HC A02/MF A02

The feedback system under test on a LaCoste Romberg gravimeter is directly connected to the transducer without (LCR) CPI card. The bridge capacitors are measured by the phase shift of a square wave signal applied to the two capacitors. The voltage inducing the electrostatic force is applied to the short capacitor which corresponds to the largest gap. After a while the situation is reversed. By averaging the excitation signals, a figure proportional to the mean restoring force is obtained. For voltages as large as 60 v, the gravimeter remains stable without a feedback range of about 100 milligal.

TEMPERATURE MEASUREMENTS **c35**

M. VanRuymbeke, H. Westerhaus (Kiel Univ., Germany.), and J. Fernandez (Universidad Complutense, Madrid, Spain.) *In its* Papers Presented at the Eleventh International Symposium on Earth Tides 1991 p 73-83 (For primary document see N94-15800 03-46)

Copyright Avail: CASI HC A03/MF A02

An electronic interface adapted to solid state thermistors, placed in a probe for boreholes, is described. Four applications are detailed: temperature profiles in a borehole at the Royal Observatory of Belgium (ROB); continuous records of water temperature in boreholes in Turkey which confirm that a thermal wave is induced by Earth tides; high precision temperature profiles along an underground gallery in the Corona volcano (Lanzarote island); continuous records of rock temperature in the same site to check the thermal influence in the tidal instruments installed nearby. In conclusion, thermometers developed at the ROB give a precision of 5 mK for differential measurements in different sites. Placed in permanent position, a long term precision of 1 mK seems possible. For detection of thermal waves induced at a well defined period (for example Earth tides), a 10 microK precision is clearly obtained. A noise level of 1 microK or better seems to be achieved. The noise decreases during one week after the set pump of thermistors. The grounding of the supply, a moisture protection and a close contact between the thermistor and the environment are the key points for the best performances.

CALIBRATION PLATFORMS FOR GRAVIMETERS **c35**

M. VanRuymbeke *In its* Papers Presented at the Eleventh International Symposium on Earth Tides 1991 p 95-100 (For primary document see N94-15800 03-46)

Copyright Avail: CASI HC A02/MF A02

Several methods investigated in order to calibrate gravimeters by the inertial acceleration produced by a vertical motion are described. The VRR 8601 calibrating platform is especially designed to calibrate La Coste and Romberg gravimeters. For heavier gravimeters such as tidal La Coste or superconducting instruments, two other principles are possible to lift up sinusoidally the platform: a mercury crapaudine or the rotation on an inclined plane.

Since 1981, the State Seismological Bureau of China (BES) and the Royal Observatory of Belgium (ORB) have cooperated for instrumentation in the ORBES project. The results of the horizontal strainmeter ORBES 81 installed at Huangshi (China) station confirm the quality of the mechanical design and of the VLR electronics. New prototypes of vertical strainmeters (ORBES 84) with two kinds of transducers (capacitive and inductive) are installed at Huangshi and Walferdange (Luxembourg) stations. The drift rate is low and the calibration system has been improved. The inductive and capacitive sensors give quite similar results in amplitude and phase. A new barometer ORBES 83 is now recording at Brussels (Belgium) near the superconducting gravimeter and is compared with a standard barometer. A Chinese FSQ watertube is installed in Walferdange. The analysis results are in very good agreement with the VM pendulums and the error level is very low.

ON TIDAL PARAMETERS AT BRUSSELS FUNDAMENTAL STATION

c48

B. Ducarme and M. VanRuymbeke *In its* Papers Presented at the Eleventh International Symposium on Earth Tides 1991 p 157-166 (For primary document see N94-15800 03-46)

Copyright Avail: CASI HC A02/MF A02

The accepted values of the tidal factor delta at Brussels (Belgium) disagree by about 1 percent with the most recent model based on the Wahr-Dehant model for the body tides and in the Schwiderski maps for the tidal loading computation. Several attempts previously made to redetermine more precisely these parameters are described, and the results obtained with a zero method LaCoste and Romberg gravimeter calibrated by means of an oscillating platform are given. This experiment confirms that a 1 percent decrease of the accepted value of delta(O(sub 1)) at Brussels seems to be required. This is also confirmed by an independently calibrated Askania gravimeter installed at the Dourbes station. ESA

NONTIDAL GRAVITY CHANGES OBSERVED WITH A SUPERCONDUCTING GRAVIMETER

F. DeMayer and B. Ducarme (Belgian Royal Observatory, Brussels.) *In* Belgian Royal Observatory, Papers Presented at the Eleventh International Symposium on Earth Tides 1991 p 167-184 (For primary document see N94-15800 03-46)

Copyright Avail: CASI HC A03/MF A02

Recordings made by a superconducting gravimeter GWR at the Royal Observatory of Belgium (Brussels) are reported. Its long term trend is difficult to model due to instrumental perturbations. When a reliable drift model is built, periodical gravity changes show up at the annual and Chandlerian (430 days) periods. Unfortunately the length of the observation (four and a half years) does not yet allow a complete separation of the two contributions and a correct evaluation of the amplitude factor delta associated with the Chandler term. The amplitude of the anomalous annual term reaches 3 microgal. It is however possible to suppress the annual contribution by introducing a phase shift to the polar motion effect. With this model an amplitude factor delta close to unity but a phase lag of 44 days is obtained, which is unrealistic. In any case a complete model for the gravity variations leaves final residues with a standard deviation of 1.7 microgral bit these residues do not yet exhibit a white noise structure which implies the necessity of including other perturbing factors. ESA

EARTH TIDES RESULTS OBTAINED WITH GRAVIMETERS, CLINOMETERS, AND STRAINMETERS IN BELGIUM AND IN GRAND DUCHY OF LUXEMBOURG

P. Melchior, J. A. Flick (Laboratoire Suoterrain de Geodynamique, Luxembourg.), B. Ducarme, M. VanRuymbeke, F. DeMayer (Institut Royal Meteorologique de Belgique, Brussels.), and J. Rasson (Institut Royal Meteorologique de Belgique, Dourbes.) *In its* Papers Presented at the Eleventh International Symposium on Earth Tides 1991 p 197-210 (For primary document see N94-15800 03-46)

Copyright Avail: CASI HC A03/MF A02

Very long series of tidal registrations in the horizontal and vertical components and in the horizontal and vertical strain have been obtained in Belgium and in the Grand Duchy of Luxembourg since 1961. In 1988, the Sclaigneaux station was closed, not only because of practical difficulties of maintenance but also because the 27 years series obtained looked sufficiently informative. Sclaigneaux was the station where the resonance effect in diurnal waves K(sub 1) and P(sub 1) was for the first time experimentally demonstrated. Results on tilt, strain and gravity are tabulated. RESULTS OF TIDAL GRAVITY OBSERVATIONS WITH A CONICAL PENDULUM

J. Rasson *In* Belgian Royal Observatory, Papers Presented at the Eleventh International Symposium on Earth Tides 1991 p 211-215 (For primary document see N94-15800 03-46)

Copyright Avail: CASI HC A01/MF A02

Several years of observations of the gravity tide were recorded with the conical pendulum in the feedback mode. This means that the instrument is calibrated by design and that the calibration factor is traceable to a frequency standard. The noise level is in the range of tens of microgals, and the delta factors are estimated at the percent level. The results are presented and discussed. Various suggestions are given for improving the instrument so that full use can be made of its calibration accuracy. ESA

WHAT WE CAN LEARN ABOUT OCEAN TIDES FROM TIDE GAUGE AND GRAVITY LOADING MEASUREMENTS?

O. Francis and P. Mazzega (Centre National d'Etudes Spatiales, Toulouse, France.) *In its* Papers Presented at the Eleventh International Symposium on Earth Tides 1991 p 287-298 (For primary document see N94-15800 03-46)

Copyright Avail: CASI HC A03/MF A02

The harmonic constants from tide gauge stations and from gravity loading measurements of the ICET (International Center for Earth Tides) data bank are separately inverted to produce M2 cotidal maps on a global scale. The optimal interpolation of these data, based on the total inverse theory in L2 norm, makes use of a set of a priori stationary and isotropic covariance functions deduced from a global hydrodynamical model and from its corresponding gravity loading map. The preliminary results presented with formal error estimates are surprisingly good, in particular the M2 maps obtained from the numerous tide gauge data. These results are discussed and further lines of work are drawn. ESA

WATER-LEVELS FLUCTUATIONS IN A BOREHOLE AT THE ROYAL OBSERVATORY OF BELGIUM: EFFECTS ON LOCAL GRAVITY, EARTH TIDAL, AND BAROMETRIC RESPONSES

M. Delcourt-Honorez *In its* Papers Presented at the Eleventh International Symposium on Earth Tides 1991 p 389-411 (For primary document see N94-15800 03-46)

Copyright Avail: CASI HC A03/MF A02

A borehole was drilled at the Royal Observatory of Belgium in Brussels, next to the superconducting gravimeter. Three aquifers belong to the 'multiple aquifer-aquitard system'. Continuously since Jun. 1984, various kinds of water levels variations are registered: long term and short term variations and, in the intermediate and deep wells, periodic tidal oscillations. Moreover, the water table and the pressure heads respond to the atmospheric pressure variations. The water levels variations perturbing effects in the superconducting gravimeter registrations are estimated and the hydraulic problem and the consolidation problem are studied. The classical Bouguer's formula in theories is enlarged, taking into account the nature of the layers, the expansions or compressions of each layer, the global land surface displacement and the various hydrostatic occurrences of phases on porous media. The Bouguer's theory is also extended to the case of a finite thickness layer, by a numerical integration. The water levels variations in the intermediate and deep aquifers (at long term, at short term, and the barometric and tidal responses) are only inducing negligible perturbing effects on the superconducting gravimeter registrations but the effect of the water table drift is at the limit of the actual precision of the gravimeter registrations. On the other hand, the barometric and tidal responses of the well-aquifer systems are used to estimate the in situ parameters of both the aquifers and the aquifer system (porosity, specific storage, vertical compressibility, and permeability). The estimated values are in good agreement with those deduced by using hydrogeological, soil, and rock mechanics considerations. The research presented can be applied to any hydrogeological configuration with any complexity. ESA

The Earth Tides Data Bank holds the results of more than three

hundred tidal gravity stations. Fifty percent of them are directly connected to the ICET (International Center for Earth Tides) network and outside of Europe it is ninety percent of them. The correlation between the tidal loading vector L computed from Schwiderski maps and the tidal residual vector B deduced from these observations by computing the linear regression of the in phase and the out of phase components is studied. If the coastal stations (D less than or equal to 5 km) are discarded, the slopes of the regression lines are equal to unity except for the sine components in Europe where the observed effect is 5% larger than the computed one. A phase lag of the body tides is observed: the independent term is not significantly different from zero for the cosine components while, for the sine components, and for any combination of stations, it takes negative values comprised between -0.200 and -0.300 which corresponds to a phase lag of -0.4 deg. This value is in agreement with the evaluation by Schwiderski of the effect of the pressure of the oceanic tides on the tidally deformed bottom of the ocean. ESA

A statistical study of the two components of tidal residues X(Khi, khi) shows a larger scattering for the in phase component X cos Khi corresponding to regional effects. Further investigations demonstrate a clear correlation between X cos Khi and the regional heat flow for the waves O(sub 1) and M(sub 2). The existence of a linear dependence is established: an increase of 0.4 to 0.5% of the body tides amplitude corresponds to an increase of 10 mW/sq m. ESA

Three tasks are analyzed: to agree upon one definition of the tidal parameters to be proposed for a recommendation; to agree upon one tidal model to account for as many physical phenomena as possible according to the advance of the technology used for the observation; and to agree on a tidal potential development. Tidal parameters are defined as Earth's transfer functions, and include the tidal gravimetric factor, Love number, tilt, and strain. The main results of the discussions are summarized and problems to be investigated are pointed out. ESA

TECTONIC DEFORMATION IN SOUTHERN CALIFORNIA Final Technical Report
David D. Jackson 1 Nov. 1993 4 p
(Grant NAG5-447)
(NASA-CR-194621; NAS 1.26:194621) Avail: CASI HC A01/MF A01

Our objectives were to use modern geodetic data, especially those derived from space techniques like Very Long Baseline Interferometry (VLBI), Satellite Laser Ranging (SLR), and the Global Positioning System (GPS) to infer crustal deformation in southern California and relate it to plate tectonics and earthquake hazard. To do this, we needed to collect some original data, write computer programs to determine positions of survey markers from geodetic observables, interpret time dependent positions in terms of velocity and earthquake caused episodic displacements, and construct a model to explain these velocities and displacements in terms of fault slip and plate movements. This report contains 4 separate contributions, as well as abstracts of the investigations submitted as quarterly technical reports during FY-92. A systematic analysis of teleseismic P-wave travel time and amplitude variations across the NORSAR array reveals the following: (1) SP time and amplitude anomalies are related; (2) SP and LP time variations are only partially related; and (3) LP amplitude variations are very small. It is generally appreciated that later arrivals contain important information about the seismic source and about the earth's structure. The arrival times of later phases reported to the ISC have been used for tomographic studies of the earth's deep interior by several workers. The phases of PcP and PKKP were analyzed as the detections of these phases were sufficiently numerous product meaningful statistics. The results of the investigations are given. Synthetic seismograms may provide a better understanding of wave propagation in complex media. A novel scheme for computing 2D synthetics based on numerical solutions of the elastic wave equation using finite-difference techniques has been presented in a previous contribution. Recently this scheme has been generalized to models with free surface tomography, and the usefulness of synthetic seismogram analysis to elucidate wave propagation in the crust and mantle lithosphere is demonstrated. The status of development of the Northern Europe Regional Array Network is summarized. DTIC

THE FEASIBILITY OF TROPOSPHERIC AND TOTAL OZONE DETERMINATION USING A FABRY-PEROT INTERFEROMETER AS A SATELLITE-BASED NADIR-VIEWING ATMOSPHERIC SENSOR Ph.D. Thesis
Allen Maurice Larar 1993 194 p Sponsored by NASA Original contains color illustrations
(NASA-TM-109342; NAS 1.15:109342) Avail: CASI HC A09/MF A03; 3 functional color pages

Monitoring of the global distribution of tropospheric ozone (O3) is desirable for enhanced scientific understanding as well as to potentially lessen the ill-health impacts associated with exposure to elevated concentrations in the lower atmosphere. Such a capability can be achieved using a satellite-based device making high spectral resolution measurements with high signal-to-noise ratios; this would enable observation in the pressure-broadened wings of strong O3 lines while minimizing the impact of undesirable signal contributions associated with, for example, the terrestrial surface, interfering species, and clouds. The Fabry-Perot Interferometer (FPI) provides high spectral resolution and high throughput capabilities that are essential for this measurement task. Through proper selection of channel spectral regions, the FPI optimized for tropospheric O3 measurements can simultaneously observe a stratospheric component and thus the total O3 column abundance. Decreasing stratospheric O3 concentrations may lead to an increase in biologically harmful solar ultraviolet radiation reaching the earth's surface, which is detrimental to health. In this research, a conceptual instrument design to achieve the desired measurement has been formulated. This involves a double-etalon fixed-gap series configuration FPI along with an ultra-narrow bandpass filter to achieve single-order operation with an overall spectral resolution of approximately .068 cm(exp -1). A spectral region of about 1 cm(exp -1) wide centered at 1054.73 cm(exp -1) within the strong 9.6 micron ozone infrared band is sampled with 24 spectral channels. Other design characteristics include operation from a nadir-viewing satellite configuration utilizing a 9 inch (diameter) telescope and achieving horizontal spatial resolution with a 50 km nadir footprint. A retrieval technique has been implemented and is demonstrated for a tropical atmosphere possessing enhanced tropospheric ozone amounts. An error analysis assessing the impact on retrieved O3 amounts of the most significant uncertainties associated with this particular measurement has been performed for several different types of atmospheres. Results show the proposed instrumentation to enable a good measurement of absolute ozone amounts and an even better determination of relative changes, with a range of accuracy to within 7.55 to 20.6 percent for integrated tropospheric amounts (and 1.99 to 4.02 percent for total O3 column abundance) and a corresponding range in precision to within 7.73 to 10.4 percent (and 3.30 to 3.95 percent for total O3 column abundance), for the atmospheric conditions considered. A SEARCH FOR EVIDENCE OF NONLINEAR ELASTICITY IN THE EARTH
T. M. Daley, J. E. Peterson, Jr., and T. V. McEvilly Dec. 1992 61 p
(Contract DE-AC03-76SF-00098)
(DE93-015279; LBL-33313) Avail: CASI HC A04/MF A01

Attempts to observe nonlinear elasticity in seismic wave propagation have been made in recent years. The sought-after nonlinear effects include harmonic distortion of a monofrequency wave and nonlinear superposition of two waves of differing frequencies. Most recent work has focused on laboratory measurements in rock samples, and there has been no definitive publication of nonlinear wave propagation in situ in rocks of the earth. Because LBL research has involved crustal seismic experiments over a wide range of scales, there exists an excellent data base from which we can draw appropriate experimental data. In mid-1991, we proceeded to use in-house data in a search for effects of nonlinear elasticity. The data sets selected include seismic reflection profiles from the Tehachapi Mountains area of California and seismic wave monitoring data from the Parkfield earthquake prediction experiment. In addition, we conducted one field experiment explicitly for detection of nonlinear wave propagation in conjunction with a previously planned Vertical Seismic Profile (VSP) at the Dept. of Energy's Nevada Test Site (NTS), and we analyzed a special data set acquired recently by Los Alamos National Lab (LANL) in West Texas in an attempt to verify nonlinear wave propagation during a seismic reflection profile. These data sets used Vibroseis energy sources which allowed analysis of time-separated frequency-domain data. DOE

OPTIMIZATION OF SATELLITE COVERAGE IN OBSERVING CAUSE AND EFFECT CHANGES IN THE IONOSPHERE, MAGNETOSPHERE, AND SOLAR WIND M.S. Thesis
Martin J. Loveless Jun. 1993 103 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A267956; AFIT/CI/CIA-93-118) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Disturbances in the ionosphere sometimes cause adverse effects to communications systems, power grids, etc. on the earth. Currently, very little, if any, lead time is given to warn of an impending problem. If a forecast could be made of ionospheric occurrences, some lead time may be given to appropriate agencies and equipment may be saved. Most changes that occur in the ionosphere are a result of interaction of energy, currents, etc. between the magnetosphere and/or solar wind. Before a forecast can be made, however, improvement of ionospheric models currently in use need to be made. The models currently depict features in various regions of the ionosphere but not always where these features are actually observed. So an improvement to the model is needed to create an accurate baseline condition, or in other words an accurate depiction of the current ionosphere. Models could be improved by inputting real-time data from the ionosphere into the model. This data would come from satellites and/or ground-based stations. DTIC

EFFECT OF POWERFUL OBLIQUE HF WAVES ON IONOSPHERIC D-LAYER ABSORPTION Technical Report
R. M. Bloom 13 Apr. 1993 18 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F19628-90-C-0100)
(AD-A268443; PL-TR-93-2098) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

A simple model of D-layer ionospheric heating in the presence of strong, high frequency (HF) radio waves is used to predict the anomalous, nonlinear wave absorption due to collisional and recombination effects induced by the indirect signal. It is found that little anomalous absorption occurs until effective radiated power (ERP) approaches 100 dBW; further increases in power of several dB beyond this 100 dBW threshold are frustrated by a comparable increase in self-induced, one-way absorption. This trend of increasing absorption with increasing transmitter ERP has considerable implications for design of communication or radar systems that use ultra-powerful, high-gain HF transmitters. [MICRO- AND MESO-SCALE SIMULATIONS OF MAGNETOSPHERIC PROCESSES RELATED TO THE AURORA AND SUBSTORM MORPHOLOGY] Final Technical Report, Jun. 1989 - Nov. 1991
Daniel W. Swift 1991 4 p
(Grant NAGw-1787)
(NASA-CR-193437; NAS 1.26:193437) Avail: CASI HC A01/MF A01

The primary methodology during the grant period has been the use of micro or meso-scale simulations to address specific questions concerning magnetospheric processes related to the aurora and substorm morphology. This approach, while useful in providing some answers, has its limitations. Many of the problems relating to the magnetosphere are inherently global and kinetic. Effort during the last year of the grant period has increasingly

focused on development of a global-scale hybrid code to model the entire, coupled magnetosheath - magnetosphere - ionosphere system. In particular, numerical procedures for curvilinear coordinate generation and exactly conservative differencing schemes for hybrid codes in curvilinear coordinates have been developed. The new computer algorithms and the massively parallel computer architectures now make this global code a feasible proposition. Support provided by this project has played an important role in laying the groundwork for the eventual development or a global-scale code to model and forecast magnetospheric weather. A PHYSICAL MODEL FOR ONE-DIMENSION AND TIME-DEPENDENT IONOSPHERE. PART 2: RESULTS AND DISCUSSIONS
Shunrong Zhang and S. M. Radicella Mar. 1993 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-627959; IC-93/46-Pt-2) Avail: CASI HC A03 (US Sales Only)

Results of a one-dimension time-dependent ionospheric theoretical model when experimental critical frequency of the F(sub 2) region are used as input data are given. Evidences of the validity of the mentioned model are shown; and it is indicated that the bottom side F region described by IRI90 empirical model for Wuchang (30.5 deg N, 11.4 deg E) are well reproduced by the theoretical model for different seasons and low solar activity, meanwhile, it is shown that IRI gives values of the electron concentration in the topside larger than the model. Also, the effect of the dynamics and the photo-ionization on the variation of the height of the peak is discussed. DOE

THE MADONA EXPERIMENTS (METEOROLOGY AND DIFFUSION OVER NON-UNIFORM AREAS): HIGH-RESOLUTION IN-PLUME CONCENTRATION FLUCTUATIONS MEASUREMENTS USING LIDAR REMOTE SENSING TECHNIQUE Interim Data and Analysis Report
Torben Mikkelsen, Hans E. Joergensen, Soeren Thykier-Nielsen, Soern W. Lund, and Josep M. Santabarbara 16 Apr. 1993 73 p
(Contract DAJA45-92-M-0344)
(AD-A267711; R/D-6858-EN-09) Avail: CASI HC A04/MF A01

The scientific objective for our participation in MADONA was to investigate fundamental questions regarding the statistical properties of the instantaneous concentration fluctuations in smoke plumes and puffs. The joint-venture Porton Down experiments, with international participation and support, facilitated this objective. Modeling objectives included investigation and experimental evaluation of flow and diffusion modelling based on our LINCOM/RIMPUFF real-time codes. DTIC

SENSITIVITY TESTING OF A SINGLE-DOPPLER TEMPERATURE RETRIEVAL AND FORECAST SYSTEM
Thomas M. Hamill and Thomas Nehrkorn 1 Feb. 1993 94 p
(Contract F19628-91-C-0011)
(AD-A267278; PL-TR-93-2071; SR-4) Avail: CASI HC A05/MF A01

Results are presented from the second year of a three-year contract to explore the feasibility of local thunderstorm forecasting based on the assimilation of single-Doppler radar data. The method used can assimilate Doppler radial winds, derive a tangential component, infer temperature distributions from the wind, and assimilate the resultant information. The underlying analysis and assimilation methodology is explained in detail. This is then followed with a set of sensitivity experiments using simulated Doppler radar data generated from a numerical model forecast. A simple 2-D experiment is first presented which confirms the benefit of temperature assimilation to complement wind data assimilation. Second, a set of 3-D model experiments is presented to test the sensitivity of the model to observational data type and error characteristics. The results suggest that forecast accuracy is relatively insensitive to the observational error, though this result is in part due to the inherent smoothing built into the objective analysis and the assumption of no biases in the wind observations. DETERMINATION OF MOMENTUM FLUX USING A BIVANE AND CUP ANEMOMETER M.S. Thesis
Thomas L. Schiano Dec. 1992 219 p
(AD-A265414; AFIT/CI/CIA-92-119) Avail: CASI HC A10/MF A03

The ability of a bivane and cup anemometer system to provide data that can be used to determine momentum flux is examined for conditions in the near-surface boundary layer. Use of a bivane for such a purpose was first proposed by Chimonas, who suggested a method for obtaining an approximation of the flux magnitude from time-mean values of angular deflection and horizontal wind speed. Both the approximation proposed by Chimonas and an accepted statistical method (covariance of wind components, u'w') are examined. A three-axis sonic anemometer was used to obtain the reference values of u'w'. The evaluated system consisted of a three-cup anemometer for determination of the horizontal wind vector, and a dual annulus bivane, used to determine the elevation (vertical) angle of the wind vector. In three field tests under various degrees of stability, the instruments were suspended from an instrumented tower on a boom oriented relative to the prevailing horizontal wind flow. Output voltages from the instrumentation were collected and subsequently converted to the desired components through the use of empirically-derived transfer functions. Examination of data reveals high degrees of correlation between the patterns and magnitudes of the components derived from the bivane/three-cup anemometer system as compared to those measured with the sonic anemometer. Computations of momentum flux yielded comparable values between the two systems. Based on these results, conclusions are presented concerning the validity of the different methods of estimating momentum flux. Author

SHORT TERM WEATHER FORECASTING IN REAL TIME IN A BASE WEATHER STATION SETTING
Frank P. Colby, Jr. and Keith L. Seitter Oct. 1992 21 p
(Contract F19628-91-K-0040)
(AD-A266872; AD-E201472; TR-92-2341; SR-1) Avail: CASI HC A03/MF A01

Starting with computer code for a research model developed by Seitter and Colby (1992), initial steps were taken to make the model a real-time forecasting tool. Several procedures are required to initialize and run the model from real data. The code to automate this process has been written and tested. In addition, an error condition in the interactive nesting region related to terrain has been corrected. DTIC

DETERMINATION OF SUNSHINE DURATION FROM RADIATION INTENSITY PYRANOMETRIC MEASUREMENTS OF GLOBAL AND SKY RADIATION [ERMITTLUNG DER SONNENSCHEINDAUER AUS PYRANOMETRISCH GEMESSENEN BESTRAHLUNGSSTAERKEN DER GLOBAL- UND HIMMELSSTRAHLUNG]
Dietrich Sonntag and Klaus Behrens 1992 69 p In GERMAN
(Ber-181; ISBN-3-88-148273-3; ETN-93-94617) Copyright Avail: Issuing Activity (Deutscher Wetterdienst, Zentralamt, Frankfurter Str. 135, D-6050 Offenbach am Main, Germany)

On the basis of the definition of the meteorological parameter 'sunshine duration', the application in practice of sunshine duration values is discussed. Measuring methods and instruments are described taking into consideration both calorimetric and photometric instruments. Several calorimetric measuring methods are described. The first method provides the utilization of a Sun tracked pyroheliometer: there is sunshine as soon as the direct solar irradiance exceeds 120 W/sq m. In the case of the second method, the direct solar irradiance on a horizontal surface resulting from a global and sky irradiance measured with pyranometers was determined and divided by the sine of the altitude of the Sun. The value obtained was compared with the threshold of 120 W/sq m. As the calculation of the sine of the altitude of the Sun is rather difficult, two approximation procedures are given as methods 3 and 4 utilizing the forest solar irradiance in a horizontal surface determined by pyranometric measurements as described under method 2. ATLAS-2 AND UARS CORRELATIVE MEASUREMENT OPPORTUNITIES DURING SPACE SHUTTLE MISSION ON APRIL 8-17, 1993
Edwin F. Harrison, Fred M. Denn (Lockheed Engineering and Sciences

Co., Hampton, VA.), and Gary G. Gibson (Lockheed Engineering and Sciences Co., Hampton, VA.) Oct. 1993 69 p
(RTOP 618-22-31-03)
(NASA-TM-109020; NAS 1.15:109020) Avail: CASI HC A04/MF A01

The second ATmospheric Laboratory for Applications and Science (ATLAS-2) mission was flown aboard the Space Shuttle Discovery from 8-17 Apr. 1993. The nighttime launch at 0529 Greenwich Mean Time provided maximum solar occultation sunrise coverage of the northern latitudes by the Atmospheric Trace Molecule Spectroscopy instrument. The ATLAS-2 Earth-viewing instruments provided a large number of measurements which were nearly coincident with observations from experiments on the Upper Atmosphere Research Satellite (UARS). Based on instrument operating schedules during the ATLAS-2 mission, simulations were performed to determine when and where correlative measurements between ATLAS and UARS instruments occurred. Results of these orbital and instrument simulations provide valuable information for the ATLAS and UARS scientists to compare measurements between various instruments on the two satellites. Author

TAFVER 2 USERS MANUAL
Christopher A. Donahue May 1993 29 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A266850; USAFETAC/TN-93/003; AWS-TN-93/003) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

TAFVER 2 is an automated quality control program designed to provide headquarters staff (at HQ USAF/XOW, HQ Air Weather Service, and the Major Command Directorates of Weather) a tool they can use to measure the quality of weather support provided by the Air Force weather community. The TAFVER 2 program, run by the USAF Environmental Technical Applications Center (USAFETAC) at Scott AFB, verifies all Terminal Aerodrome Forecasts (TAF's) issued by Air Force weather forecasters providing there are corresponding observations against which to verify them. TAFVER 2 accommodates customer-tailored output by incorporating command-unique category thresholds. This technical note tells users how the TAFVER 2 program verifies weather forecasts and explains the output statistics. Appendices provide major command verification categories and USAFETAC's weather station information databases. DTIC

ENVIRONMENTAL CHARACTERIZATION FOR TARGET ACQUISITION. REPORT 1: SITE DESCRIPTIONS AND MEASUREMENTS
Tommy Berry, Salvador Rivera, Jr., and Bruce Sabol Jun. 1993 198 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A267192; WES/TR/EL-93-9-Rept-1) Avail: CASI HC A09

Automatic/Aided Target Recognition (ATR) systems are being developed for current and next generation attack and reconnaissance helicopters. Part of the development cycle consists of testing and evaluation of these systems at field test facilities within the United States. Preliminary tests of ATR systems have demonstrated a high sensitivity to terrain and environmental conditions. Testers and analysts must therefore have an understanding of the relationship between system performance and terrain/environmental conditions to plan tests and interpret data. To develop an understanding of this relationship, the Environmental Characterization for Target Acquisition (ECTA) Program was initiated. As part of this program, visible and thermal infrared imagery, meteorological data, and terrain characterization data were systematically collected from six different United States testing sites for different times of year and times of day. This report (Report 1) describes field and laboratory procedures used to obtain this data. Analysis of these data is described in Report 2. DTIC

RADAR DIAGNOSTIC PARAMETERS AS INDICATORS OF SEVERE WEATHER IN CENTRAL FLORIDA
C. H. Paxton and J. M. Shepherd Jun. 1993 19 p See also PB92-101823 Prepared in cooperation with Florida State Univ., Tallahassee, FL.
(PB93-183507; NOAA-TM-NWS-SR-149) Avail: CASI HC A03/MF A01

Diagnostic techniques based on WSR-88D radar observations and sounding data are needed to assess severe storm potential in Florida's semi-tropical thunderstorm environment. To begin this effort, nearly 100 severe weather events involving hail 3/4 in (1.9 cm) or greater in diameter, thunderstorm wind gusts 50 kt (26 m/s) or greater, or tornadoes were examined, along with RADAP II reflectivity and VIL (Vertically Integrated Liquid) observations. RADAP II algorithms are similar to those which will be employed with the WSR-88D's. Several other parameters, including (1) cell density (VIL divided by echo top), (2) cell momentum (VIL (mass per unit area) multiplied by storm velocity produces a quantity proportional to momentum and will be referred to as momentum for the study), and (3) echo top growth rates were calculated for comparison with severe storm reports. In addition, a formula for hail detection was derived to represent processes responsible for different types of severe weather. Tornadoes are classified by the method of formation as stretched vortex, gust induced or dynamic. Severe wind gusts are classified primarily by the time of year in which they occur. Results from the study could be integrated into WSR-88D severe weather algorithms designed more specifically for the Florida environment. NTIS

MIDDLE ATMOSPHERIC ELECTRIC FIELDS OVER THUNDERSTORMS Final Report, 1 May 1982 - 30 Jun. 1992
Robert H. Holzworth 30 Jun. 1992 18 p
(Grant NAG5-604)
(NASA-CR-194619; NAS 1.26:194619) Avail: CASI HC A03/MF A01

This grant has supported a variety of investigations all having to do with the external electrodynamics of thunderstorms. The grant was a continuation of work begun while the PI was at the Aerospace Corporation (under NASA Grant NAS6-3109) and the general line of investigation continues today under NASA Grants NAG5-685 and NAG6-111. This report will briefly identify the subject areas of the research and associated results. The period actually covered by the grant NAG5-604 included the following analysis and flights: (1) analysis of five successful balloon flights in 1980 and 1981 (under the predecessor NASA grant) in the stratosphere over thunderstorms; (2) development and flight of the Hy-wire tethered balloon system for direct measurement of the atmospheric potential to 250 kV (this involved multiple tethered balloon flight periods from 1981 through 1986 from several locations including Wallops Island, VA, Poker Flat and Ft. Greely, AK and Holloman AFB, NM.); (3) balloon flights in the stratosphere over thunderstorms to measure vector electric fields and associated parameters in 1986 (2 flights), 1987 (4 flights), and 1988 (2 flights); and (4) rocket-borne optical lightning flash detectors on two rocket flights (1987 and 1988) (the same detector design that was used for the balloon flights listed under #3). In summary this grant supported 8 stratospheric zero-pressure balloon flights, tethered aerostat flights every year between 1982-1985, instruments on 2 rockets, and analysis of data from 6 stratospheric flights in 1980/81. THE MULTIVARIATE OPTIMUM INTERPOLATION ANALYSIS OF METEOROLOGICAL DATA AT THE FLEET NUMERICAL OCEANOGRAPHY CENTER Final Report
James S. Goerss and Patricia A. Phoebus Apr. 1993 61 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A266459; NRL/FR/7531-92-9413; NOARL-31) Avail: CASI HC A04

The operational global database at the Fleet Numerical Oceanography Center (FNOC) is the most complete in the world. In addition to conventional radiosonde and surface data, it includes satellite-derived temperature soundings and satellite-derived wind information, along with synthetic observations in the vicinity of extratropical and tropical storms. To take full advantage of this database for improved meteorological analyses and forecasts, significant upgrades were made to the Navy Operational Global Atmospheric Prediction System (NOGAPS) at FNOC in January of 1988. These improvements included the implementation of a global spectral forecast model, a normal-mode initialization, improved data quality control, and a multivariate optimum interpolation (MVOI) analysis scheme. Since that time, the MVOI has become the centerpiece of all the Navy's meteorological data assimilation systems, providing global, regional, and local analysis capability both ashore and afloat. In a data assimilation system like NOGAPS, the 6-hour model forecast valid at the analysis time is used as the background for the analysis. The analysis, in turn, combines

information from the background with the quality-controlled observations to provide updated fields that are used to initialize the forecast model. The MVOI analysis utilizes data from all available platforms to produce analyzed fields that possess minimum error in a statistical sense, while taking into account the error properties of the model forecast used for the background fields and the error properties of the observational data used to update the background. INVESTIGATION OF CLOUD PROPERTIES AND ATMOSPHERIC STABILITY WITH MODIS Semiannual Report, Jan. - Jun. 1993
Paul Menzel 1993 9 p Original contains color illustrations
(Contract NAS5-31367)
(NASA-CR-193475; NAS 1.26:193475) Avail: CASI HC A02/MF A01; 1 functional color page

The work accomplished with the MAS (MODIS Airborne Simulator) during the TOGA-COARE (Tropical Ocean Global Atmosphere - Coupled Ocean Atmosphere Response Experiment) from January through June 1993 included cloud investigations with longwave CO2 channels (out to 13.9 microns) that reconfigured spectral channels. The comparison data was used with HIRS (high resolution Infrared Radiation Sounder) data from FIRE (First ISSCP Regional Experiment), CEPEX, and SCAR (Smoke Clouds, Aerosol and Radiation) data for the development of a two layer cloud CO2 slicing algorithm and the development of multi-spectral cloud detection algorithms (specifically tri-spectral) for cloud identification. Regarding the latter, a clustering analysis was added to improve cloud identification within the scatter diagram of tri-spectral (8, 11, and 12 microns) brightness temperatures. Via the regressions of the 8 - 11 and the 11 - 12 micron brightness temperature differences versus precipitable water, the problem of clear sky identification in the scatter diagram was further addressed. Comparison of the tri-spectral technique and visible channel reflectance ratioing indicate the tri-spectral infrared method distinguishes cloud phase more consistently in mixed cloud scenes rather than single phase cloud scenes where visible ratioing performs best. ENSEMBLE FORECASTING TECHNIQUES IN MEDIUM-RANGE FORECASTING M.S. Thesis
Steven W. Warren Mar. 1993 126 p
(AD-A267443) Avail: CASI HC A07/MF A02

A continuing trend in numerical weather prediction (NWP) is the desire for reduced model forecast error. Developments in NWP such as advanced computing power and improved model physics and analysis methods have been successful in lowering error but are potentially limited. The regression method of ensemble forecasting is used to further reduce mean forecast error when compared to individual model forecast performances. A statistical regression scheme is utilized to achieve an optimum combination fitting of the National Meteorological Center, the European Centre for Medium-Range Weather Forecasts, and the U.S. Navy Fleet Numerical Oceanography Center forecast models. The performance of the regression model is evaluated for 72-h and 108-h prediction cycles through statistical and subjective comparisons with the individual models and an equally weighted ensemble model at the surface and at 500 hPa. The regression model is shown to produce gains through the reduction of systematic error present in the individual model forecasts. DTIC

MESOSCALE FRONTOGENESIS: AN ANALYSIS OF TWO COLD FRONT CASE STUDIES M.S. Thesis
William J. Spendley, Jr. 1993 120 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A267950; AFIT/CI/CIA-93-037) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

A comparative analysis of mesoscale-Beta frontogenesis is presented for two case studies of cold fronts that originated west of the Appalachians and moved across North Carolina during the Genesis of Atlantic Lows Experiment (GALE). The evolution of the fronts is depicted with a detailed three-dimensional analysis. The two cold fronts are compared to the classic model of fronts established by the Norwegian school. Diagnostic computations of divergence, vorticity, dynamical forces, and frontogenesis were performed. The individual contributions of shear, confluence, and diabatic terms were determined to assess their relative importance in frontogenetical forcing. The diabatic process of differential cloud shading and its thermal impact at the surface contributed significantly to the development of a zone of strong temperature gradient ahead of both wind shift lines. A more extensive cloud free area contributed to more widespread diabatic forcing in case 1 as compared to case 2. Meteograms, satellite imagery, and diagnostic computations of divergence, vorticity, and frontogenesis confirm that only the extreme eastern portion of both wind shift lines over the coastal plain and adjacent waters of North Carolina remained active and well-defined. The confluence term dominated frontogenetical forcing over this region. It is hypothesized that the pre-existing baroclinic zone over the cold Atlantic shelf waters had a pronounced influence on the regeneration of the frontal boundaries along extreme eastern North Carolina. Results of other relevant studies confirm this possibility. The dynamical force balance and parcel trajectories were computed at selected times. DTIC

THE STANDARDIZED PRECIPITATION INDEX AND ITS USE IN THE WESTERN CONTIGUOUS UNITED STATES M.S. Thesis
Keith Forman 3 May 1993 124 p
(AD-A267547; AFIT/CI/CIA-93-097) Avail: CASI HC A06/MF A02

Droughts have been a concern to all sectors of the economy since the beginning of mankind. The importance of understanding, monitoring, and forecasting these dry events is of paramount concern to the world considering the population increases seen over the last few decades. There is a finite supply of water available to the world in the relatively inexpensive forms needed for drinking and to support food productions. DTIC

PHILLIPS LABORATORY GLOBAL SPECTRAL NUMERICAL WEATHER PREDICTION MODEL Final Report, Oct. 1988 - Sep. 1991
Donald C. Norquist, Chien-Hsiung Yang, Sam Chang, and Douglas C. Hahn 11 Sep. 1992 166 p
(AD-A267293; AD-E201500; PL-TR-92-2225; ERP-1108) Avail: CASI HC A08/MF A02

This report documents the ten-year (1981-91) development of the Phillips Laboratory Global Spectral Model (PL GSM). Beginning with the National Meteorological Center Model of 1980, the hydrodynamics of the model were recoded and new physical parameterizations were developed for radiation, planetary boundary layer, cumulus convection, and gravity wave drag effects on the large-scale forecast fields. A sequence of tests and parameterization refinements were carried out to arrive ultimately at the current version of the PL GSM, termed PL-91. The report describes its performance with respect to that of the operational AFGWC GSM in a series of six January and June forecasts. The PL-91 version appears to produce better forecasts of virtually all parameters, producing small systematic errors and slower error growth. The model is envisioned to serve as a research tool to develop techniques for global cloud forecasting. DTIC

THE USE OF THE AIR FORCE ACADEMY HIGH WIND ALERT SYSTEM IN FORECASTING MODERATE INTENSITY WIND EVENTS FOR MILITARY BASES IN THE COLORADO SPRINGS AREA M.S. Thesis
Douglas S. Clark Aug. 1993 45 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A267648) Avail: CASI HC A03

A study of the problem of forecasting moderate intensity wind events in the Colorado Springs area, which are operationally significant to the military bases there, was conducted over a three year period. This study centered on the use of the United States Air Force Academy High Wind Alert System, a network of automatic observing stations in the foothills of the Air Force Academy. The usefulness of the High Wind Alert System as an aid to forecasting the onset of moderate intensity events at the other bases was investigated. The results of a statistical analysis of data taken from the High Wind Alert System on a number of days during which the synoptic conditions indicated the possibility of a moderate intensity wind event are presented, with emphasis on the correlation between the output from the High Wind Alert System and the time of onset of moderate intensity winds at the concerned bases. The results of this analysis, along with the possible empirical forecasting rules they suggest, are explained. DTIC

OROGRAPHIC MICROBURSTS IN A SEVERE WINTER WINDSTORM M.S. Thesis
Zena A. Tucker 1993 49 p
(AD-A267651; AFIT/CI/CIA-93-019) Avail: CASI HC A03/MF A01

Orographic microbursts in a remarkable winter wind storm caused severe damage to the San Juan Islands and coastal regions of Washington State on 28 Dec. 1990. The microbursts, associated with trapped lee mountain waves, produced winds in excess of 50 m/s on Guemes Island. The damage patterns of the tree fall and debris reveal small scale swaths and pockets of high winds similar to those patterns caused by convective downbursts. Analysis of large scale features reveal that an underlying cause of the strong winds was a strong pressure gradient behind an arctic front. The strong pressure gradient was due to cold air damming on the eastern slopes of the Canadian Coast and Cascade Mountains. Gap wind acceleration was noted over Puget Sound by the sharp boundary between the high speed jet of dry air emanating from the Fraser River Valley, a gap between the Coast and Cascade Mountains, and the ambient lower speed marine winds. NOWCASTING METHODS FOR SATELLITE IMAGERY
Thomas Nehrkorn, Thomas C. Hamill, and Lawrence W. Knowlton 27 May 1993 122 p
(Contract F19628-92-C-0014)
(AD-A267294; PL-TR-93-2021; SR-1) Avail: CASI HC A06/MF A02

This report documents the development and testing of nowcasting methods for satellite imagery. Techniques for identifying, tracking, and forecasting features of interest through contours of brightness temperature in geostationary IR imagery were evaluated in a study covering over 200 features from all four seasons. Results indicate that because contours frequently split, merge, or dissipate, contour based techniques are successful in only a minority of cases. The most skillful contour extrapolation technique is movable persistence, which simply extrapolates the position of the contour based on the past movement of its centroid position. Its verification scores are significantly better than persistence for forecasts from 1/2 to 3 hours in advance. As an alternative to the contour-based schemes, a cross-correlation technique for predicting short-term changes in pixel grayshade values (brightness temperatures) was developed and tested. Pixel-based verification of the cross-correlation forecasts show an improvement over persistence out to 2 1/2 hours (the longest time period studied for this technique). Contour forecasts derived from cross-correlation are significantly more skillful than those of the best contour extrapolation technique (movable persistence) out to 1 hour and no worse out to 2 1/2 hours. (RTOP 505-64-12-01)
(NASA-TM-109012; NAS 1.15:109012) Avail: CASI HC A07/MF A02

This document contains a description of a comprehensive database that is to be used for certification testing of airborne forward-look windshear detection systems. The database was developed by NASA Langley Research Center, at the request of the Federal Aviation Administration (FAA), to support the industry initiative to certify and produce forward-look windshear detection equipment. The database contains high resolution, three dimensional fields for meteorological variables that may be sensed by forward-looking systems. The database is made up of seven case studies which have been generated by the Terminal Area Simulation System, a state-of-the-art numerical system for the realistic modeling of windshear phenomena. The selected cases represent a wide spectrum of windshear events. General descriptions and figures from each of the case studies are included, as well as equations for F-factor, radar-reflectivity factor, and rainfall rate. The document also describes scenarios and paths through the data sets, jointly developed by NASA and the FAA, to meet FAA certification testing objectives. Instructions for reading and verifying the data from tape are included. Author

VALIDATION AND ANALYSIS OF MICROWAVE-DERIVED RAINFALL OVER THE TROPICS M.S. Thesis
Robert P. Fleishauer 1993 89 p
(AD-A267785; AFIT/CI/CIA-93-020) Avail: CASI HC A05/MF A01

A recently developed single channel microwave rain rate retrieval algorithm exists to measure global precipitation over the data-sparse tropical oceans. The objective of this study is to retrieve and validate rainfall using this algorithm, followed by an analysis of the derived rainfall fields. Retrieval consists of applying the algorithm technique to the extraction of four years worth of achieved data from the Electrically Scanning Microwave Radiometer (ESMR) instrument flown aboard the NIMBUS 5 satellite. The Pacific Atoll Raingage Data Set is chosen as a ground truth measure to validate the ESMR-Derived rainfall data against, comparing slope, intercept and correlation between 5 deg x 5 deg area average. Despite limitations imposed by the comparison of point measurements to area-averaged rainfall, results show a 0.80 correlation. Monthly and quarterly climatological mean rainfall estimates are produced, with a consequent analysis of prominent signals, especially in the Intertropical Convergence Zone (ITCZ), South Pacific Convergence Zone (SPCZ) and the Indian monsoon. Latent heat flux is computed, using the ESMR-derived rainfall, and plotted to show qualitatively where seasonal latent thermodynamic energy sources and sinks exist in the atmosphere. A comparison of the summer and winter quarterly composites of the above products with previously compiled climatologies and Outgoing Longwave Radiation (OLR) showed only minor discrepancies in location and intensity, which are discussed in some detail. A COMPARISON OF CEILING AND VISIBILITY OBSERVATION FOR NWS MANNED OBSERVATION SITES AND ASOS SITES M.S. Thesis
Jon C. Cornick May 1993 80 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268356; AFIT/CI/CIA-93-022) Avail: CASI HC A05

The National Weather Service modernization program involves, among other things, a shift from manned weather observation to automated, unmanned instrument sensing. The Automated Surface Observing System (ASOS) is the device that will replace the conventional manned weather observation in use today. ASOS observations of ceiling and visibility were compared to the standard manual observations at 16 sites having at least four months of overlap data. The 16 sites were located in the central plains states of Colorado, Nebraska, Missouri, Kansas, Oklahoma, and Texas. The period of study was confined to the precommissioning period of the sites when both conventional data and ASOS data were available. The study spans from mid September of 1991 to late July 1992, with the greatest amount of data collected between February and June 1992. The overall results show that ASOS ceiling reports were within 1000 ft of conventional ceiling reports 92.7% of the time. Similarly, ASOS derived visibility was within one reportable category of conventionally derived visibility 93.7% of the time. These percentages were determined from a data base composed of approximately 64,000 observations. DTIC

ARCTIC CYCLONES AND MARGINAL ICE ZONE (MIZ) VARIABILITY M.S. Thesis
John Rutherford Mar. 1993 87 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268610) Avail: CASI HC A05

The Seasonal Ice Zone Experiment (SIZEX), conducted in January 1992, was designed as the European Space Agency's ERS-1 synthetic-aperture radar (SAR) validation experiment. The satellite was placed in a three day exact repeat orbit, with ascending and descending passes which crossed the Greenland Sea marginal ice zone. In conjunction with SAR imagery collected by the Nansen Environmental and Remote Sensing Center, the research vessel Hakon Mosby recorded meteorological data on station near the ice edge. The marginal ice zone was subjected to atmospheric and oceanographic forcing during the 7-16 January period which resulted in significant changes in ice edge morphology. As intense low pressure systems propagated across the Greenland Sea, strong easterly and northerly winds dominated oceanographic forcing and created a compact

ice edge which correlated with the 50% ice concentration isopleth from the SSM/I passive microwave sensor. Conversely, during periods of weak atmospheric forcing, the ice edge became diffuse and the ice edge morphology was determined by a variety of oceanic circulations. In this instance the actual ice edge position was well correlated with a 30% concentration isopleth. DTIC

OPPOSING MESOSCALE FLOWS IN A BROKEN MIDLATITUDE SQUALL LINE M.S. Thesis
Barbara D. Miner 1993 126 p
(AD-A268011; AFIT/CI/CIA-93-012) Avail: CASI HC A07/MF A02

During the period 14-15 June 1985 a broken line of convection with one primary gap (echo-free) region developed along a cold front passing through the Oklahoma-Kansas Preliminary Regional Experiment for STORM-Central (OK PRESTORM) domain. Radar and satellite data are presented to provide an overview of the life cycle of the line. Observations from the OK PRESTORM mesonetwork and upper air soundings are used to document the occurrence of the gap and an associated surface mesolow. The convective line initially developed as two mesoscale convective systems (MCS's), one in northeast Kansas, the other in the Texas panhandle, along a weak cold front. As the two MCS's matured, convection developed between the two similar to the broken-line squall line formation described by Bluestein and Jain (1985). Despite strong low-level convergence and strong moisture convergence, an echo-free region remained between the two MCS's throughout the life cycle of the line. DTIC

PROPAGATION CHARACTERISTICS OF MESOSCALE CONVECTIVE SYSTEMS M.S. Thesis
Charles H. Pappas 1993 99 p
(AD-A268130; AFIT/CI/CIA-93-021) Avail: CASI HC A05/MF A02

Case studies were undertaken of mesoscale convective systems (MCS) on an individual storm basis to examine factors influencing MCS propagation characteristics. This was done by examining numerous specific storms during a portion of the warm seasons (June-September) of 1990 through 1992. Three cases were presented in detail to illustrate the types of propagation typically exhibited by mesoscale convective systems. This research attempts to analyze why MCS's exhibit a particular type of propagation and if that propagation can be accurately predicted by forecasters on an operation basis. Parameters such as moisture convergence, surface boundaries (fronts, dry lines, etc), Convective Available Potential Energy (CAPE), equivalent potential temperature, vertical wind shear, and others were used in the diagnosis of a particular region where a storm grew and propagated toward. FURTHER DEVELOPMENT AND TESTING OF A SECOND-ORDER BULK BOUNDARY LAYER MODEL M.S. Thesis
Richard D. Krasner 3 May 1993 134 p
(AD-A268071; AFIT/CI/CIA-93-018) Avail: CASI HC A07/MF A02

A one-layer bulk boundary layer model is developed. The model predicts the mixed layer values of the potential temperature, mixing ratio, and u- and v-momentum. The model also predicts the depth of the boundary layer and the vertically integrated turbulence kinetic energy (TKE). The TKE is determined using a second-order closure that relates the rate of dissipation to the TKE. The fractional area covered by rising motion sigma and the entrainment rate (E) are diagnostically determined. The model is used to study the clear convective boundary layer (CBL) using data from the Wangara, Australia boundary layer experiment. The Wangara data is also used as an observation base to validate model results. A further study is accomplished by simulating the planetary boundary layer (PBL) over an ocean surface. This study is designed to find the steady-state solutions of the prognostic variable. DTIC

FORECASTING THE DUCTING OF ELECTROMAGNETIC WAVES ON THE MESOSCALE M.S. Thesis
Scott P. Simcox Aug. 1993 85 p
(AD-A268101; AFIT/CI/CIA-93-122) Avail: CASI HC A05/MF A01

Ducting of electromagnetic waves in the lower troposphere can have a significant impact on radar coverage. However, despite the importance of identifying ducting conditions, operational forecasts of these conditions are still based on a primitive, single-station approach. Single-Station ducting analyses are available operationally through the Navy's Integrated Refractive Effects Prediction System (IREPS) software. This software can provide a satisfactory point analysis of ducting conditions, but significant spatial and temporal variations of ducting in the atmosphere can also seriously limit the utility of the output. By combining IREPS with mesoscale model output, however, there is the opportunity for significant improvement in the predictability of ducting conditions. Subsidence inversions are a primary cause of atmospheric ducting. These inversions are common during the summer season over the west coast of the United States, particularly west-central California. Fortunately, they can be effectively modeled because they are generally very strong and quite persistent. In this thesis, a study of the predictability of inversion-generated ducting conditions over west-central California is conducted by combining output from the Penn State/NCAR non-hydrostatic mesoscale modeling system (MM5) with the IREPS ducting analysis software. THREE DIMENSIONAL VISUALIZATION OF GOES CLOUD DATA USING OCTRESS M.S. Thesis
Bruce H. VanAartsen Jun. 1993 86 p
(AD-A268102; AFIT/CI/CIA-93-119) Avail: CASI HC A05/MF A01

Geostationary Operational Environmental Satellite (GOES) imagery is commonly displayed in a two-dimensional format. This is adequate to portray areas as being simply cloudy or clear, but often more information is desired. A three-dimensional display could be helpful in analyzing the information, and could improve understanding of the atmospheric conditions. Many three-dimensional visualization packages model just the smoothed object surfaces. While this may be aesthetically pleasing, it does not effectively represent volumetric data, and the smoothed surfaces may compromise data integrity. This thesis presents octree encoding as a structure that can effectively represent volumetric data with the added benefits of data compression and acceleration of volume rendering. The fundamentals of octree encoding are introduced, along with strengths and weaknesses, and which data sets are better suited to octree compression. To demonstrate the capabilities of octree encoding of cloud data, GOES imagery was gathered over Central America for the month of December 1990, and a program called VOXEL (VOlumetric piXEL) was utilized for octree encoding and three-dimensional visualization. VOXEL displays are shown to illustrate the greater visual impact of three-dimensional vs. two-dimensional data. VOXEL is also used to demonstrate how two-dimensional cloud climatologies are overlaid to create a three-dimensional array, which can then be rotated, sliced, or thresholded as desired. DTIC

AN ANALYSIS OF SIMULATED AND ACTUAL DMSP SSM/T-2 BRIGHTNESS TEMPERATURES M.S. Thesis
Frank A. Leute, IV May 1993 213 p
(AD-A268103; AFIT/CI/CIA-93-016) Avail: CASI HC A10/MF A03

Defense Meteorological Satellite Program (DMSP) Special Sensor Microwave/T-2 (SSM/T-2 or T-2) global brightness temperature maps are related to some of the known observed general circulation features of the atmosphere and surface characteristics of Earth. The brightness temperatures from two regions with different large scale circulations are compared and contrasted. The concept of the invariance of the weighting

functions with respect to water vapor overburden is tested. It is demonstrated that the levels where the 183 + or - 1 and 3 GHz brightness temperatures match the thermodynamic temperature are levels of approximately equal overburden. Water vapor overburden (integrated water vapor above a given level) was retrieved and mapped on a constant pressure surface from T-2 brightness temperatures and atmospheric temperature-pressure data. A simple physical retrieval scheme based on the approximately equal overburden, irrespective of the moisture profile, for the 183 + or - 1 GHz frequency was developed and demonstrated. This simple retrieval could be used to initialize more sophisticated retrievals. DTIC

A TWO-LAYER QUASI-GEOTROPHIC SPHERICAL MODEL: FORMULATION AND CLIMATOLOGY
Shuting Yang 22 Apr. 1993 39 p Prepared in cooperation with International Meteorologicl Inst., Stockholm, Sweden Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DM-63; ETN-93-94629) Avail: CASI HC A03

A two layer, quasi-geostrophic spherical model is developed for the purpose of studying weather regimes. The model can successfully reproduce a realistic zonal mean structure and a large scale energy spectrum. The geographical distribution of the model climatology and the time variability is reasonable. The location relation of the maximum low frequency variability and the maximum baroclinic activity also resembles observations, although the baroclinic activity is underestimated by the model. Weather regime events can be identified in the simulated circulations in terms of localized persistent anomalies. The transitions to the regime events are not as persistent as in the atmosphere. These features of the model suggest that the model can be used for understanding the internal dynamical processes of weather regime phenomena in the atmosphere. ESA

AN EMPIRICAL STUDY OF TROPICAL CLOUD CLUSTERS USING SPECIAL SENSOR MICROWAVE IMAGER DATA M.S. Thesis
Mark P. Weadon Aug. 1993 100 p
(AD-A268072; AFIT/CI/CIA-93-120) Avail: CASI HC A05/MF A02

Fifteen cases of Tropical Cloud Clusters (TCC's) in the western Pacific were analyzed using infrared satellite imagery and microwave satellite data from the Special Sensor Microwave Imager (SSM/I). Microwave data yielded atmospheric parameters of integrated water vapor, liquid water path, ice water path, and surface rainrate. Analyzed fields of SSM/I-derived parameters were then compared with each other and with infrared blackbody cloud top temperatures of TCC's in various stages of development. It was found that TCC's form preferentially in regions of elevated integrated water vapor. It is hypothesized that this extremely humid pre-storm environment signals large scale ascent, contributing to favorable conditions for tropical convection. Areas of surface precipitation retrieved from SSM/I were found, in general, to correlate to infrared cloud top temperatures of less than -65 C, though the coldest cloud tops did not necessarily coincide with the heaviest rain. It was found that the microwave signature of a TCC changes over the course of its life cycle, from a balance of liquid water emission and ice scattering in the intensifying and mature phases, to a predominance of liquid water emission over ice scattering in the dissipating phase. THE CENTRAL AMERICAN COLD SURGE: AN OBSERVATIONAL ANALYSIS OF THE DEEP SOUTHWARD PENETRATION OF NORTH AMERICAN COLD FRONTS M.S. Thesis
Philip J. Reding Dec. 1992 191 p
(AD-A268592) Avail: CASI HC A09/MF A02

The occurrence and structure of the Central American Cold Surge (CACS) is quantified using surface and upper air observations, GOES satellite imagery and satellite estimates of total precipitable water (TPW) and rain rate. A quantitative CACS definition, similar to established East Asian Cold Surge definitions, is developed and used to construct an eleven winter season climatology of CACS frequency and relative strength. Central America experiences between 11 and 21 CACS events each winter season, with a winter season average of 16 events. GOES imagery is analyzed to quantify the duration and southward penetration of CACS events. Each cold surge typically affects Central America for 3 to 6 days, but may persist for up to 13 days. The mean CACS southward penetration ranges from 12 deg N to 14 deg N, while the maximum southward penetration is approximately 7 deg N. Over 76% of CACS events penetrate south of 15 deg N and over 26% penetrate south of 10 deg N. CACS onset characteristics are described from Belize City, Belize surface observations. A wind shift to the north, a sharp rise in sea level pressure, and an increase in low-level cloud cover are the best cold surge indicators. CACS events contribute from 70% to 90% of the winter season precipitation across Central America. Temporal cross sections of upper air data are constructed to quantify the vertical structural characteristics of the pre- and post-CACS atmosphere. The most common feature is an increase in the depth of the moist layer after frontal passage. TPW and rain rate are estimated from satellite microwave observations. DTIC

In general circulation models (GCM's), some properties of a grid element are necessarily considered homogeneous. That is, for each grid volume there is associated a particular combination of boundary layer depth, vertical profiles of wind and temperature, surface fluxes of sensible and latent heat, etc. In reality, all of these quantities may exhibit significant spatial variations within the grid area, and the larger the area the greater the likely variations. In balancing the benefits of higher resolution against increased computational time and expense, it is useful to consider what the consequences of such subgrid-scale variability may be. Moreover, in interpreting the results of a simulation, one must be able to define an appropriate average value over a grid. There are two aspects of this latter problem: (1) in observations, how does one take a set of discrete or volume-averaged measurements and relate these to properties of the entire domain?, and (2) in computations, how can subgrid-scale features be accounted for in the model parameterizations? To address these and related issues, two field campaigns were carried out near Boardman, Oregon, in June 1991 and 1992. These campaigns were designed to measure the surface fluxes of latent and sensible heat over adjacent areas with strongly contrasting surface types and to measure the response of the boundary layer to those fluxes. This paper discusses some initial findings from those campaigns. DOE

LFASE REPORT: CRUSTAL STUDY Final Report, 1 Oct. 1988 - 31 Mar. 1991
Liliya V. Posiolova and John A. Orcutt 12 Jul. 1993 37 p
(Contract N00014-89-C-0064)
(AD-A266893) Avail: CASI HC A03/MF A01

The data set described was collected on 150-154 Ma oceanic crust during the DARPA/Navy Low Frequency Acoustic Seismic Experiment (LFASE). This is some of the oldest lithosphere remaining in the modern oceans. The experiment used an array of airguns as a source and ocean bottom seismographs (OBS) and a borehole array as receivers. Our final model of the seismic structure of oceanic crust at the LFASE site was obtained using travel times along with general characteristics of amplitudes and waveforms of the crustal P-wave arrivals. The results of the LFASE seismic data interpretation are discussed and our results are compared to those of Purdy for 140 Ma lithosphere. DTIC

FINE SCALE MEASUREMENTS OF MICROWAVE BACKSCATTER FROM THE OCEAN SURFACE
James B. Mead 13 May 1993 40 p
(Contract N00014-91-C-0138)
(AD-A264516) Avail: CASI HC A03/MF A01

This report summarizes work performed under an ONR contract entitled 'Fine Scale Measurements of Microwave Backscatter from the Ocean Surface'. During this Phase 2 SBIR project we built a new-concept Focused Phased Array Imaging Radar (FOPAIR) system capable of producing very fine scale (approximately 1m x 1m) radar cross-section and radial velocity images of the ocean surface. Phase 2 work began in July of 1991 and within 20 months we had completed preliminary tests of the entire FOPAIR system from a roof top site in Amherst, MA. On 5 May 1993 we brought the FOPAIR system to North Truro, MA, where we demonstrated the system's ability to image ocean surface waves at ranges up to 500 m. Following submission of this report, Quadrant will deliver FOPAIR to the University of Massachusetts Microwave Remote Sensing Laboratory. FOPAIR will be used initially to study scattering from breaking waves and will participate in the upcoming Marine Boundary Layer Accelerated Research Initiative (MBL-ARI). Author

ARCTIC INTERNAL WAVES (CEAREX) Final Report
Murray Levine and Clayton Paulson 1993 1 p
(Contract N00014-90-J-1036)
(AD-A265822) Avail: CASI HC A01/MF A01

We successfully deployed a horizontal and vertical array of instruments beneath the Arctic pack ice during the Coordinated Eastern Arctic Experiment (CEAREX). The measurements were made near 83 deg N and 5 to 11 deg E at the 'C' Camp during Mar.-Apr. 1989. A variety of sensors were deployed: 7 current meters, 11 temperature sensors, 9 conductivity sensors, 5 temperature-conductivity recorders, and 1 acoustic Doppler profiler. The measurements were made between the surface and 250 m depth; horizontal separations ranged from 75 to 500 m. The drifting ice camp permitted us to observe the upper ocean internal wave in a variety of different background conditions including: quiescent deep water, strong diurnal oscillations, and an eddy. Spectra and coherences of the velocity and temperature time series show that the internal wave field varies significantly with the background. In the quiescent period over deep water internal wave energy was the lowest observed during CEAREX--about one-half of the mid-ocean value given by the Garrett-Munk model (GM). As the camp drifted over the slope of the Yemak Plateau, strong diurnal oscillations were observed. The energy in the high-frequency internal wave field also increased--to about three times the GM level. Near the end of the experiment the camp drifted over an eddy; internal wave energy dropped. IAI TOPIC: EL NINO. SOUTHERN OSCILLATION AND INTERANNUAL CLIMATE VARIABILITY
Antonio Divino Moura and Vernon Edgard Kousky 1992 21 p Presented at the Scientific Experts Meeting of the Inter-American Inst. for Global Change Research, Washington, DC, 5-6 Mar. 1992
(INPE-5410-PRE/1757) Avail: CASI HC A03/MF A01

Observational, modeling and theoretical work by scientists all over the world, especially during the last decade, has lead to an understanding that the abnormal warming of the Pacific Ocean is intimately related to a consistent pattern of climate anomalies throughout the tropics and many parts of the globe. The climatic disasters of 1982-83 are an extreme example of an irregular but recurring pattern known as the warm episode phase of the El Nino-Southern Oscillation (ENSO) cycle. ENSO is an irregular cycle, with extremes of variable amplitude recurring at intervals of 3 to 7 years. The impact of ENSO warm episodes is such that warmer than normal winters are expected in northwestern United States and southeastern Canada, due to a jet stream split, that brings warmer tropical air to the region, while flooding are likely to occur in the Gulf Coast States. Increased frequency of forest fires has been associated with the cold phases of ENSO due to low precipitation in many areas. Global Circulation Models which are incapable of properly simulating interannual time scale ocean variability in the tropical Pacific are being argued as not being well suited for longer (decadal to centennial) time scale simulation of climate change. These scientific facts added to the tremendous economic value of the climate information on these time scales for socio-economic planning, make this topic a natural choice to be included among those of relevance in the scientific agenda of the Inter-American Institute (IAI) for Global Change Research. Avail: CASI HC A03/MF A01

The Sea-viewing Wide Field-of-view Sensor (SeaWiFS) is the follow-on ocean color instrument to the Coastal Zone Color Scanner (CZCS), which ceased operations in 1986, after an 8-year mission. SeaWiFS is expected to be launched in 1994, on the SeaStar satellite, being built by Orbital Sciences Corporation (OSC). The SeaWiFS Project at the National Aeronautics and Space Administration's (NASA) Goddard Space Flight Center (GSFC) has undertaken the responsibility of documenting all aspects of this mission, which is critical to the ocean color and marine science communities. This documentation, entitled the SeaWiFS Technical Report Series, is in the form of NASA Technical Memorandum Number 104566. All reports published are volumes within the series. This particular volume serves as a reference, or guidebook, to the previous 11 volumes and consists of 6 sections including: an errata, an addendum (a summary of the SeaWiFS Working Group Bio-optical Algorithm and Protocols Subgroups Workshops), an index to keywords and phrases, a list of all references cited, and lists of acronyms and symbols used. It is the editors' intention to publish a cumulative index of this type after every five volumes in the series. This will cover the topics published in all previous editions of the indices, that is, each new index will include all of the information contained in the preceding indices. Author

EXPLORING THE SOUTHERN OCEAN RESPONSE TO CLIMATE CHANGE Final Report
Douglas G. Martinson, David Rind (National Aeronautics and Space Administration. Goddard Inst. for Space Studies, New York, NY.), and Claire Parkinson (National Aeronautics and Space Administration. Goddard Space Flight Center, Greenbelt, MD.) 1993 3 p
(Grant NAGw-1844)
(NASA-CR-194601; NAS 1.26:194601) Avail: CASI HC A01/MF A01

The purpose of this project was to couple a regional (Southern Ocean) ocean/sea ice model to the existing Goddard Institute for Space Science (GISS) atmospheric general circulation model (GCM). This modification recognizes: the relative isolation of the Southern Ocean; the need to account, prognostically, for the significant air/sea/ice interaction through all involved components; and the advantage of translating the atmospheric lower boundary (typically the rapidly changing ocean surface) to a level that is consistent with the physical response times governing the system evolution (that is, to the base of the fast responding ocean surface layer). The deeper ocean beneath this layer varies on time scales several orders of magnitude slower than the atmosphere and surface ocean, and therefore the boundary between the upper and deep ocean represents a more reasonable fixed boundary condition. SEA ICE MOTIONS IN THE CENTRAL ARCTIC ICE CENTRAL ARCTIC PACK ICE AS INFERRED FROM AVHRR IMAGERY Annual Progress Report
William Emery, James Maslanik, and Charles Fowler Oct. 1993 10 p
(Grant NAGw-2948)
(NASA-CR-194572; NAS 1.26:194572) Avail: CASI HC A02/MF A01

Synoptic observations of ice motion in the Arctic Basin are currently limited to those acquired by drifting buoys and, more recently, radar data from ERS-1. Buoys are not uniformly distributed throughout the Arctic, and SAR coverage is limited regionally and temporally due to the data volume, swath width, processing requirements, and power needs of the SAR. Additional ice-motion observations that can map ice responses simultaneously over large portions of the Arctic on daily to weekly time intervals are thus needed to augment the SAR and buoy data and to provide an intermediate-scale measure of ice drift suitable for climatological analyses and ice modeling. Merging the remotely-sensed ice motions with SAR, AVHRR, OLS, and SSM/I imagery permits studies of ice processes over a range of space and time scales. A medium-resolution passive microwave sensor might be ideal for this purpose, but no such satellite will be available in the near future. Combinations of existing data types are thus likely to be our best bet for generating motion fields with a coverage and resolution best suited to climate studies. Principal objectives of this project are to: (1) demonstrate whether sufficient ice features and ice motion existed within the consolidated ice pack to permit motion tracking using AVHRR imagery; (2) determine the limits imposed on AVHRR mapping by cloud cover; and (3) test the applicability of AVHRR-derived motions in studies of ice-atmosphere interactions. ON THE APPLICATION AND EVALUATION OF THE RELOCATABLE DIECAST OCEAN CIRCULATION MODEL IN COASTAL AND SEMI-ENCLOSED SEAS
David E. Dietrich, Dong-Shan Ko, and Lanny A. Yeske 1 Jul. 1993 71 p
(Contract N00014-92-J-4109)
(AD-A266626; CAST-TR-93-1) Avail: CASI HC A04/MF A01

To improve coastal and semi-enclosed seas modeling, a new DieCAST Ocean Model has been developed. In application to the Gulf of Mexico (GOM), this model gives remarkably similar results to that obtained from the Sandia Ocean Model System (SOMS) and at a computational speed much faster than SOMS or other ocean models presently available. The results are supported by many GOM observations including GEOSAT rms sea-surface-height anomaly data; mean thermocline and empirical orthogonal functions; the evolution of vortex pairs in the western GOM; major loop current eddy shedding period; shed eddy size, phase speed, dispersion rate and vorticity; and detailed loop current and shed eddy structure. Finally, a major advantage of DieCAST is its capability to be easily relocated to any geographical region of the globe. Preliminary applications in several regions such as the Mediterranean, South China Sea, Great Lakes, and Labrador Current are described. Author (revised)

RAY TRACING ON TOPOGRAPHIC ROSSBY WAVES Summary Report
Christopher Meinen, Erik Fields, Robert Pickart, and D. R. Watts May 1993 47 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contracts N00014-92-J-4013; N00014-90-J-1568; NSF OCE-87-17144)
(AD-A267014; GSO-TR-93-1) Avail: CASI HC A03

Topographic Rossby Waves (TRW's) were identified with the largest variability in deep current meter records along the continental slope in the Mid-Atlantic Bight (MAB). Ray tracing theory is applied to TRW's using the real bottom topography of the MAB and the observed stratification. The depression relation for TRW's is derived and various wavenumber limits are discussed. A computational method for tracing the waves is presented including the necessity of smoothing the bathymetry. In the examples shown, TRW's with periods of 24-48 days generally propagate southwestward, changing their wavelengths from 400 to 100 kilometers in response to the change in bottom slope. TRW paths are shown that connect from the SYNOP Central Array near 68 deg W to the SYNOP Inlet Array near Cape Hatteras. DTIC

COMPOSITE REFRACTION-REFLECTION STACK SECTIONS: TRACING FAULTS IN THE ATLANTIC COASTAL PLAIN SEDIMENTS
D. E. Stephenson, C. Coruh (Virginia Polytechnic Inst. and State Univ., Blacksburg.), and J. K. Costain (Virginia Polytechnic Inst. and State Univ., Blacksburg.) 1993 4 p Presented at the Annual Meeting of the Society of Exploration Geophysicists, Washington, DC, 26-30 Sep. 1993
(Contract DE-AC09-89SR-18035)
(DE93-013581; WSRC-MS-93-179; CONF-930901-4) Avail: CASI HC A01/MF A01

Seismic data from the Atlantic Coastal Plain are reprocessed and composite refraction-reflection stack sections are produced to investigate basement faults that penetrate upward into Atlantic Coastal Plain sediments in South Carolina. Reprocessing recovered reflections from within the deep crust to the Moho as well as from within thin veneer (300) of the Atlantic Coastal Plain sediments. One of the major objectives of this paper is to discuss the use of shallow refracted arrivals to construct a composite refraction-reflection stack that allows better imaging of the subsurface at shallow depths. OBSERVATIONS AND MODELLING OF WINDS AND WAVES DURING THE SURFACE WAVE DYNAMICS EXPERIMENT. REPORT 1: INTENSIVE OBSERVATION PERIOD IOP-1, 20-31 OCTOBER 1990
Michael J. Caruso, Hans C. Graber, Robert E. Jensen, and Mark A. Donelan Apr. 1993 200 p
(Contracts N00014-90-J-1464; N00014-92-J-1546; N00014-88-J-1028)
(AD-A266384; CERC-93-6) Avail: CASI HC A09/MF A03

This report describes the compilation of observed and modelled wind and wave parameters during the first intensive observation period (IOP-1) from October 20-31, 1990, of the Surface Wave Dynamics Experiment. The measurements include wind speeds and directions, wave heights and periods, air and sea temperatures, and atmospheric pressures from three directional wave buoys, four meteorological buoys, and several routinely operated buoys from the National Data Buoy Center (NDBC). In addition, a summary of directional wave spectra is presented for this period. The model data include examples of wind fields from six numerical weather prediction models and the corresponding wave height maps as derived from the 3G-WAM ocean wave model. Estimated surface current velocities and directions from the Harvard quasi geostrophic model are also presented for this time period. DTIC

FIELD OBSERVATIONS OF INFRAGRAVITY, SEA AND SWELL DIRECTIONAL SPECTRA
Joan Oltman-Shay 1992 22 p
(Contract N00014-91-C-0004)
(AD-A266439) Avail: CASI HC A03/MF A01

Infragravity, sea, and swell wavenumber-frequency (k-f) spectra from an alongshore-aligned array of bottom-mounted pressure sensors in 8 m depth (800 m offshore) are analyzed for their insight into edge wave generation mechanisms. Eight months of nearly continuous data are analyzed. Earlier analysis of infragravity k-f spectra from this site identified the presence of trapped edge waves, distinct from leaky waves at this offshore location. Here, edge wave variance is separated from other infragravity motions (leaky and bound waves) by their k-f location in the spectra. It is observed that on average edge waves account for approximately 50% of the total infragravity variance at this offshore location, and occasionally dominate with approximately 80% of the variance. Significant wave heights greater than 20 cm are observed. Correlation analysis of up- and downcoast progressive edge wave variance with sea and swell directional distributions suggest that swell waves propagating from the same directional quadrant as the edge wave are the dominant generation source; sea waves had significantly lower correlations. An order of magnitude difference in up- and downcoast progressive edge wave variance is occasionally observed and is shown to be expected from the theory of resonant excitation of edge waves through nonlinear difference interaction of swell waves incident to the beach at oblique angles to the normal. The correlation between swell and edge waves from the same directional quadrant is approximately linear and accounts for more than 90% of the up- and down coast edge wave variance over the 8 months. OPTICAL PROPERTIES OF THE RED SEA
Christine M. Kirby, Michelle M. Parmeter, Robert A. Arnone, and R. A. Oriol May 1993 46 p
(AD-A266466; NOO-TN-03-93) Avail: CASI HC A03/MF A01

Optical properties of the Red Sea are characterized using the Coastal Zone Color Scanner (CZCS) for the period of Jan. 1979 to Dec. 1980. The ocean color imagery gathered by the CZCS is used to determine the diffuse attenuation coefficient, K, at 490 nm. The distribution of K(490) is shown to change spatially and temporally during the 2-year period. The Red Sea circulation is influenced by the monsoons which have significant effect on the surface optical properties. Optical properties of five different regions within the Red Sea are identified and statistics determined. The southern Red Sea exhibits a higher variability than the northern Red Sea. The K(490) optical properties were low during the summer months of June and July but showed a significant increase in November as a result of the onset of the Northeast monsoon. A strong interannual difference in K(490) between 1979 and 1980 is shown for the five Red Sea regions. DTIC

DEVELOPING AUTOMATED ANALYSIS METHODS FOR SEA ICE IMAGERY: A STATUS REPORT WITH RECOMMENDATIONS Final Report
Florence M. Fetterer May 1993 43 p
(AD-A267284; NRL/FR/7240-93-9422) Avail: CASI HC A03/MF A01

The 1990's will see a rapid increase in the amount of satellite data available for the analysis and forecasting of sea ice conditions. Planning is underway to bring altimetry from the Geosat Follow-on satellite and synthetic aperture radar (SAR) imagery from the European Space Agency's Earth Remote Sensing Satellite (ERS-1), Canada's Radarsat, and Japan's Earth Resources Satellite (JERS-1) to the Navy/National Oceanic and Atmospheric Administration (NOAA) Joint Ice Center (JIC). In addition, JIC will continue to rely on visible and infrared imagery from the Advanced Very High Resolution Radiometer (AVHRR) sensor on the NOAA series of polar-orbiting satellites and passive microwave data from the Special Sensor Microwave Imager (SSM/1) onboard the Defense Meteorological Satellite Program (DMSP) satellites. JIC has relied on manual analysis of AVHRR imagery in the past. The introduction of data from new sources will require automated methods for quickly and accurately analyzing data without necessitating additional personnel. This report surveys automated analysis methods which are being explored in the sea ice research community. Recommendations are made concerning automated analysis methods which are likely candidates for development under the Remote Sensing Applications Branch's 6.2 program, followed by transition to operational use at JIC. The long-term goal of 6.2 ice work is an automated system for near-real-time analysis and forecasting of ice conditions that uses all data available at JIC. Four milestones emerge as instrumental in meeting this goal, given the present status of automated analysis research, resources, and JIC requirements. DTIC

REAL TIME SYSTEM FOR PRACTICAL ACOUSTIC MONITORING OF GLOBAL OCEAN TEMPERATURE Quarterly Progress Report No. 1
15 Jul. 1993 54 p
(Contract MDA972-93-1-0004)
(AD-A267868) Avail: CASI HC A04/MF A01

Work completed includes the algorithms which calculate the loss for geometric and diffracted rays. An algorithm was written which does not generate extraneous eigenrays. Work on the calculation of acoustic travel times using ocean models is also on schedule. Multi-year runs of the wind driven equatorial Pacific model have been completed, allowing for the extraction of the Kelvin wave signal. Remote-forced NE Pacific (NEP) model runs have been completed for 1961-1991. Two main features appear in these calculations: (1) when realistic bottom topography is included, cyclonic eddies form on the American coast, and slowly propagate westward; and (2) Kelvin waves from El Nino events produce Rossby waves with amplitude much larger than in non-El Nino years and therefore should significantly effect acoustic travel times. Algorithms for calculating the travel time from acoustic source to receiver have been developed for great circle paths. All elements of the SSAR development are well underway. The array design (spacing and number of hydrophones) is complete, as is the optimum depth determination. DTIC

This book contains a description and analysis of the spatial and temporal variations in the Arctic and Antarctic sea ice covers from October 26, 1978 through August 20, 1987. It is based on data collected by the Scanning Multichannel Microwave Radiometer (SMMR) onboard the NASA Nimbus 7 satellite. The 8.8-year period, together with the 4 years of the Nimbus 5 Electrically Scanning Microwave Radiometer (ESMR) observations presented in two earlier volumes, comprises a sea ice record spanning almost 15 years. CHEMICAL TRACER STUDIES AT IOSDL. 3: THE MEASUREMENT OF SILICATE, NITRATE AND PHOSPHATE IN SEAWATER
D. Smythe-Wright, R. Paylor, and S. E. Holley 1992 73 p
(IOS-302-1992; ETN-93-94565) Avail: CASI HC A04/MF A01; Inst. of Oceanographic Sciences, Deacon Library, Wormley, Godalming, Surrey GU8 5UB, England, HC

The measurement of nutrient species for chemical tracer studies at the Institute of Oceanographic Sciences Deacon Laboratory (IOSDL) is addressed. Analytical techniques for the measurement of silicate, nitrate and phosphate were developed using an autoanalyzer system. The analyses are based on the formation of colored complexes; the intensity of the color being directly proportional to the concentration of the nutrient in the sea water sample. The color is measured at specific wavelengths using photometric techniques. Details of the design and full analytical methods are given. ESA

PRELIMINARY ESTIMATES OF FREQUENCY-DIRECTION SPECTRA DERIVED FROM THE SAMSON PRESSURE GAGE ARRAY, NOVEMBER 1990 TO MAY 1991 Final Report
Charles E. Long and Joan M. Oltman-Shay (Quest Integrated, Inc., Kent, WA.) May 1993 94 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A267960; CERC-MP-93-3) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

In the course of the SAMSON (Sources of Ambient Micro-Seismic Noise) experiment conducted by researchers from Scripps Institution of Oceanography at the Coastal Engineering Research Center (CERC) Field Research Facility (FRF) near Duck, NC, a two-dimensional array of 24 bottom-mounted pressure sensors was deployed near the 13-m depth contour to detect unattenuated pressure signals arising from interactions of directionally opposed wave trains. The geometry of the array was ideal for wind wave directional spectral estimation in the 0.04- to 0.24-Hz frequency band. The formal SAMSON experiment took place in October and early November 1990, but data collection continued until June 1991. Data from this post-experiment period were made available to CERC and were subsequently processed with a 360-deg Iterative Maximum Likelihood Estimation algorithm to determine the general character of the local wave field, including specifically any indications of significant seaward-propagating wind wave energy. This report contains descriptions of the SAMSON array and the type of data collected, and an estimate of error for reported reflection coefficients. It contains displays, both graphic and tabular, of relevant wind wave parameters deduced from the analysis. DTIC

AN INVESTIGATION OF THE GROUND-BASED HIGH-RESOLUTION INTERFEROMETER SOUNDER (GB-HIS) IN A COSTAL MARINE ENVIRONMENT M.S. Thesis
Steven A. Rugg Dec. 1992 99 p
(AD-A268052; AFIT/CI/CIA-93-054) Avail: CASI HC A05/MF A02

Vertical temperature and moisture profiles from the Ground-Based High-Resolution Interferometer Sounder (GB-HIS) are studied for the coastal marine atmosphere. In May of 1991 and 1992, the GB-HIS instrument was operated on the Research Vessel Point Sur during a cruise off the central California coast. The ability of the GB-HIS retrieval algorithm to produce accurate temperature and moisture profiles is evaluated using Root Mean Square (RMS) difference, Bias, and Explained Variance statistics. In addition, objective analysis is performed on timesections of temperature and moisture. Temperature retrievals, on average, attained significant skill throughout the low troposphere. Moisture retrievals attained moderate skill in the lower and upper boundary layer, but no skill in the mid-boundary layer due to non-depiction of small scale moisture features. Results showed a maximum RMS temperature difference of less than 3 C and RMS dewpoint difference of less than 12 C in the low troposphere (up to 700 mb) over both cruises. Preliminary analysis of the updated retrieval algorithm is performed and further improvements are discussed. DTIC

LIST OF THE SCIENTIFIC AND PERSONAL PAPERS OF SIR GEORGE DEACON, FRS
M. B. Deacon (Southampton Univ., England.) 1992 82 p
(IOS-301-1992; ETN-93-94564) Avail: CASI HC A05/MF A01

A list of the scientific and personal papers of Sir George Deacon which fall into two main categories, oceanographic research and scientific administration, is presented. On the scientific side are data, notes and drafts for publication from his days with the Discovery Committee onwards, together with correspondence on scientific and related topics, such as attendance at meetings, etc. Administrative papers from the period when he headed Group W and the National Institute of Oceanography include files of official correspondence, relating to work in progress and to his membership of national and international committees. The importance of the collection, taken as a whole, therefore lies as much and possibly more in its documentation of the growth of an institution and the contribution of its staff to the science of oceanography at a time when both were rapidly developing, as in its reflection of the career of an individual. MERIDIONAL CIRCULATION IN THE TROPICAL NORTH ATLANTIC Technical Report

Marjorie A. Friedrichs Jan. 1993 92 p
(Grants NSF OCE-91-01636; NSF OCE-87-16314)
(AD-A268222; WHOI-93-06) Avail: CASI HC A05/MF A01

A transatlantic CTD/ADCP section nominally located at 11 deg N was carried out in March 1989. In this paper relative geostrophic velocities are computed from these data via the thermal wind balance, with reference level choices based primarily on water mass distributions. A brief overview of the meridional circulation of the upper waters resulting from these analysis techniques is presented. Schematic circulation patterns of the NADW and AABW are also presented. In both the western and eastern basins these waters are characterized by cyclonic recirculation gyres. A particularly notable result of the deep western basin analysis is the negligible net flow of middle NADW. Although the horizontal circulation patterns described in this study agree well with results from many previous studies, the meridional overturning cell and net heat flux are considerably lower, while the net freshwater flux is slightly higher than previous estimates. These discrepancies may be attributed to: differences in methodologies, the increased resolution of this section, and temporal (including decadal, synoptic, and most importantly, seasonal) variability. STATISTICS AND PHYSICAL OCEANOGRAPHY
1993 70 p Sponsored by ONR
(AD-A268565) Avail: CASI HC A04/MF A01

Research in oceanography has historically been pursued to better understand the oceans as, for example, avenues to exploration, routes for commerce, theaters for military operations, and components in the weather system. Today this research is also done in conjunction with studies on major issues such as global climate environmental change, and bio-diversity, among many others. Statistical techniques have always been important in the analysis of oceanographic data. With the recent introduction of oceanographic observational mechanisms that yield much larger quantities of data than ever before statistical considerations have gained even more prominence in oceanographic research contexts. Yet disciplinary distinctions have limited interactions across discipline boundaries in many national and global research areas; traditional statistics and oceanography are not exceptions. To stimulate progress in important research questions now arising at this interface, more cross-disciplinary efforts between statistics and oceanography are needed. This report is thus presented to help encourage successful collaborations between statistics and oceanography that are focused on potentially fruitful cross-disciplinary research areas. DTIC

NEUROPEPTIDE-Y (NPY) INCREASES TOTAL BLOOD FLOW IN THE TAIL, AND REDUCES CUTANEOUS MICROVASCULAR BLOOD FLOW IN THE TAIL AND FOOT OF THE RAT Technical Report, 1990 - 1991
M. E. Heath and J. R. Thomas 10 Feb. 1993 22 p
(DA Proj. MR0-4120)
(AD-A266839; NMRI-93-34) Avail: CASI HC A03/MF A01

The purpose of this study was to describe the in vivo effects of neuropeptide-Y (NPY) on total blood flow (BF(sub T)) and on microvascular skin blood flow (BF(sub sk)) in appendages of a whole animal model. This study is important to understanding the medical relevance of NPY in cardiovascular physiology. The tail and foot of the rat were used as the model. BF(sub sk) and skin temperature (T(sub sk)) were measured on the foot pad and mid-way along the tail with a laser Doppler flowmeter and a 40-gauge thermocouple. BF(sub T) was measured mid-way along the tail (distal to the laser Doppler flowmeter) via venous occlusion plethysmography. NPY (16, 32, 64, and 128 microgram/kg), norepinephrine

(NE) (25, 50, 100, and 400 microgram/kg), or saline alone was administered i.v. in 300 microliter volume. NE caused marked reductions in blood flow at all three sites. The duration of the contraction was correlated with the dose. NPY caused immediate marked decreases in BF(sub sk) and significant increases in tail BF(sub T), tail blood volume, and tail T(sub sk). The magnitude and duration of the changes in BF were correlated to dose. These results indicte that some vessels in the tail are dilating in response to NPY. The most likely site of this vasodilation is the arteriovenous anastoma (AVA), which are shunts between arterioles and veins. When AVA's are open, the blood volume in the tissue increases, and the BF through the tissue increases because of the decrease in resistance, and capillary BF(sub sk) often decreases as blood follows the path of least resistance. T(sub sk) also increases when AVA's are opened. DTIC

Biological materials are naturally occurring substances produced and utilized internally or externally by living organisms. In contrast, biomolecular materials are partial, complete, or modified replicas of biological materials whose synthesis and utilization may be unrelated to their original biological source. Whether the objective is to replicate the properties of a biological material, or to produce derivatives with novel properties, the ultimate goal is to attain biomolecular materials that have industrial, medical, or agricultural applications. This symposium, held at the 1992 Fall Meeting of the Materials Research Society, brought together an interdisciplinary group of scientists (zoologists, molecular biologists, biochemists, inorganic and organic chemists, materials scientists, and mathematicians) that are directly or indirectly involved in some aspect of biomolecular materials research. The diversity of biological (Nature's) materials was amply demonstrated: cockroach elastin, mussel adhesives, trematode and avian eggshells, spider and midge silks, abalone shell, rhinoceros horn, algal pigments, a bacterial hemolytic protein, and nut shells. Descriptions of these biological systems ranged from the relatively unknown to detailed information regarding the structure, composition, processing, and physical properties of the biological material. In several instances, particularly for protein-based polymers, biomolecular materials have been obtained by cellular synthesis through biotechnology. Bacterial cells have been engineered to synthesize discrete portions of insect silk and mussle adhesive proteins, multifunctional proteins with a unique combination of multiple binding sites, and recombinant proteins with specific combinations of functional groups that lead to ordered assembly into supramolecular complexes. FAULT MANAGEMENT FOR DATA SYSTEMS
Mark A. Boyd, David L. Iverson, and F. Ann Patterson-Hine Sep. 1993 23 p Sponsored by NASA, Washington
(RTOP 476-14-03)
(NASA-TM-103953; A-92147; NAS 1.15:103953) Avail: CASI HC A03/MF A01

Issues related to automating the process of fault management (fault diagnosis and response) for data management systems are considered. Substantial benefits are to be gained by successful automation of this process, particularly for large, complex systems. The use of graph-based models to develop a computer assisted fault management system is advocated. The general problem is described and the motivation behind choosing graph-based models over other approaches for developing fault diagnosis computer programs is outlined. Some existing work in the area of graph-based fault diagnosis is reviewed, and a new fault management method which was developed from existing methods is offered. Our method is applied to an automatic telescope system intended as a prototype for future lunar telescope programs. Finally, an application of our method to general data management systems is described. Author (revised)

CHARACTERIZATION OF SPATIAL AND TEMPORAL VARIABILITY OF PHYTOPLANKTON BLOOMS IN COASTAL WATERS Final Report
V. Klemas 1 Mar. 1993 11 p
(Contract N00014-91-J-1737)
(AD-A267102) Avail: CASI HC A03/MF A01

The tide-related parameters of the Delaware Bay are derived from space shuttle time-series photographs. The water areas in the bay are measured from interpretation maps of the photographs with a CALCOMP 9100 digitizer and ERDAS Image Processing System. The corresponding tidal levels are calculated using the exposure time annotated on the photographs. From these data, an approximate function relating the water area to the tidal level at a reference point is determined. Based on the function, the water areas of the Delaware Bay at mean high water (MHW) and mean low water (MLW), below 0 m, and for the tidal zone are inferred. With MHW and MLW areas and the mean tidal range, we calculate the tidal influx of the Delaware Bay, which is 2.76(10)(exp 9) cu m. Furthermore, the velocity of flood tide at the bay mouth is determined using the tidal flux and an integral of the velocity distribution function at the cross section between Cape Henlopen and Cape May. The result is 132 cm/s, which compares well with the data on tidal current charts. DTIC

CONTRIBUTION TO THE ELABORATION OF SOME ADAPTIVE CONTROL ALGORITHMS FOR FERMENTATION PROCESSES MONITORING Ph.D. Thesis - Toulouse Univ. [CONTRIBUTION A L'ELABORATION D'ALGORITHMES DE COMMANDE ADAPTATIVE POUR LA CONDUITE DE PROCEDES FERMENTAIRES]
Gilles Roux 1992 201 p In FRENCH
(LAAS-92513; ETN-93-94405) Avail: CASI HC A10/MF A03

Several problems arising from the continuous fermentation process monitoring are studied. Nonlinear systems control as well as flexible and robust adaptive control techniques are discussed. They are of crucial interest for an efficiency monitoring of the biotechnological processes. These techniques are based on the implementation of parameter estimation procedures for the modeling and real time tracking of certain physical values characterizing the process operation. They also appeal to filtering techniques for the estimation of non-measured relevant quantities which determine the process evolution. These processes are clearly nonstationary processes and ask for the development of adaptive linear or nonlinear control methods. They allow the representation of the model nonlinearities and the parameter variations to be taken into consideration. Algorithms using the inherent nonlinear structure of the fermentation process models were developed, using a single variable, then a multivariate case was studied. The control laws were theoretically studied then validated on an experimental plant. ESA

LOOKING AT FOKKER-PLANCK DYNAMICS WITH A NOISY INSTRUMENT
Gabor Schmera, Adi Bulsara, David Pierson, Frank Moss, and Enrico DiCera May 1993 3 p
(AD-A267049) Avail: CASI HC A01/MF A01

We consider the class of experiments which can be characterized by a Fokker-Planck dynamics corresponding to the overdamped motion of a state point in a suitable stochastic potential. We assume that the general form of the potential is known (or can be guessed with reasonable accuracy), but that its parameters are to be determined experimentally by measurements made with a noisy instrument. This possible method for determining the potential parameters, which exploits the system's own internal stochastic motion in order to rapidly explore its available parameter space, is substantially more efficient than traditional methods involving time averages of single point measurements, and yet does not appear to have been previously considered. The method could be important, when, for example, the experiment must be completed in a limited time owing either to the expense of the experimental materials or to the temporary stationarity of the preparation, situations which are commonly encountered in experimental biochemistry and biology. BIOORGANIC MODELS FOR PROTEIN ION CHANNELS Progress Report, 30 Jun. 1991 - 1 Jun. 1992
William F. DeGrado 1 Jun. 1992 7 p
(Contract N00014-90-C-0083)
(AD-A266365) Avail: CASI HC A02/MF A01

Biophysical characterization of ion channel peptides is discussed. We are using single-channel voltage clamp methods to study the model ion channel peptide, Ac-(LSSLLSL)3-CONH2 in an attempt to determine how selective it is for the conductance of cations versus anions. Both ends of the peptide are masked with neutral blocking groups allowing us to eliminate effects that are due to formal charges. Because the peptides can reorient upon a voltage change, we must use voltage pulses or fast ramps (approximately 100 msec) to measure full current-voltage relations on single open channels; the longer lifetime of the acetylated peptide facilitates this measurement. The open channel 1-5 relation rectifies in symmetrical 1 M KC1, with larger currents at the holding potential than at the opposite potential. According to our gating model, the larger currents flow from C-terminus to N-terminus. DTIC

ISOLATION OF THERMOSTABLE ENZYME MUTANTS BY CLONING AND SELECTION IN THERMOPHILIC BACTERIA Final Technical Report, 1 Jul. 1989 - 31 Dec. 1992
Hans H. Liao 22 Jun. 1993 4 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-3134)
(AD-A266378) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The objective of this project was to isolate thermostable variants of enzymes and to understand the molecular basis for their increased stability. Such variants may be isolated by introducing the gene encoding the enzyme into a thermophile and selecting for enzymatic activity at the high growth temperatures of these organisms. Thermostable mutants of kanamycin nucleotidyl transferase (KNTase) were obtained in this way and found to be also more resistant to chemical denaturants, to protease, and to inclusion body formation during their overexpression in Escherichia coli. The tools for obtaining mutants at up to 80 C by cloning in Thermus thermophilus, including a plasmid that transforms and expresses heterologous genes in this thermophile, were constructed, and more thermostable mutants of KNTase were isolated. Crystals of a thermostable KNTase were obtained and the structure was solved to 2.7A; comparison with the wildtype structure will allow correlation of the known genetic change with the structural basis for enhanced stability. Work was also begun on isolating thermostable mutants of another enzyme, chloramphenicol acetyltransferase. DTIC

HEAT SHOCK PROTEIN INDUCTION IN HUMAN CELLS BY CO2 LASER IRRADIATION Final Report
Ronald E. Ferrando, Steven T. Schuschereba, Phillip D. Bowman, Julie A. Quong, and Janet M. Yang 14 Jun. 1993 54 p
(AD-A266430; LAIR-486) Avail: CASI HC A04/MF A01

This study investigated the effect of millisecond exposures from a carbon dioxide (CO2) laser on the production of heat shock proteins in human fibroblast cell cultures. Heat shock or stress proteins (hsp) are induced to high levels by heat shock, transition series and heavy metals, amino acid analogs, certain chemicals, and ultraviolet radiation. These proteins are highly conserved throughout nature and their regulation and cellular functions are just beginning to be understood. The production of hsps was monitored by S-35-methionine incorporation into newly synthesized heat shock protein and by immunocytochemistry. It was shown that CO2 laser irradiation could induce the production of hsps. The time course of hsp synthesis and localization within cells was also determined. The hsp synthesis produced by the CO2 laser was compared to the effects of sodium arsenite and heat. The results of this study indicate that hsp 70 is the major heat shock protein induced by CO2 laser radiation and that this response is most likely due to the thermal effects of the laser. DTIC

TRANSRAPID TR-07 MAGLEV-SPECTRUM MAGNETIC FIELD EFFECTS ON DAILY PINEAL INDOLEAMINE METABOLIC RHYTHMS IN RODENTS
K. R. Groh 1993 6 p Presented at the 12th International Conference on Magnetically Levitated Systems and Linear Drives, Argonne, IL, 19-21 May 1993
(Contract W-31-109-eng-38)
(DE93-015143; ANL/BIM/CP-79650; CONF-930550-1) Avail: CASI HC A02/MF A01

This study examined the effects on pineal function of magnetic field (MF) exposures (ac and dc components) similar to those produced by the TransRapid TR-07 and other electromagnetic maglev systems (EMS). Rats were entrained to a light-dark cycle and then exposed to a continuous, or to an inverted, intermittent (on = 45 s, off = 15 s, induced current = 267 G/s) simulated multifrequency ac and dc magnetic field (MF) at 1 or 7 times the TR-07 maglev vehicle MF intensity for 2 hr. Other groups of rats were exposed to only the ac or the dc-component of the maglev MF. For comparison, one group was exposed to an inverted, intermittent 60-Hz MF. Each group was compared to an unexposed group of rats for changes

in pineal melatonin and serotonin-N-acetyltransferase (NAT). MF exposures at an intensity equivalent to that produced by the TR-07 vehicle had no effect on melatonin or NAT compared with sham-exposed animals under any of the conditions examined. However, 7X TR-07-level continuous 2-h MF exposures significantly depressed pineal NAT by 45%. Pineal melatonin was also depressed 33-43% by a continuous 7X TR-07 MF exposure and 28% by an intermittent 60-Hz 850-mG MF, but the results were not statistically significant. This study demonstrates that intermittent, combined ac and dc MF's similar to those produced by the TR-07 EMS maglev vehicle alter the normal circadian rhythm of pineal indoleamine metabolism. The pineal regulatory enzyme NAT was more sensitive to MF exposure than melatonin and may be a more desirable measure of the biological effects of MF exposure. DOE

BIOFILM STRUCTURE AND DIVERSITY Final Technical Report
David A. Stahl 1993 5 p
(Contract N00014-92-J-1710)
(AD-A267254) Avail: CASI HC A01/MF A01

The objective of this project is to develop molecular measures of the identity, activity, and spatial distribution of microbial populations making up natural (multispecies) biofilms. A further goal of this project is to use biofilm bioreactors to characterize the relationship between biochemical transformations and community structure, focusing on the terminal steps of anaerobic mineralization and emphasizing competitive and cooperative interactions among sulfate-reducing and methanogenic biofilm populations. Long term objectives include the identification and characterization of obligate symbioses among attached microbial populations and the refinement of mathematical models to predict the behavior of biofilm communities. (Grant AF-AFOSR-0187-89)
(AD-A266232; AFOSR-93-0448TR) Avail: CASI HC A02/MF A01

Cortical collecting duct cells were cultured on permeable membranes and used to assess cellular transport properties for calcium/cadmium. Functional viability of the cells in culture were affirmed by their ability to absorb sodium and chloride, secrete protons and potassium, and respond appropriately to the hormones vassopressin and aldosterone. Calcium absorption by these cells was affected neither by sodium blockers or hormone inducers of cyclic AMP nor, surprisingly, by various calcium channel blockers. However, when the pH of the culture medium on the apical side of the cells was controlled artificially by buffer, calcium absorption was found to be affected. Decreasing the pH inhibited calcium uptake by cells, indicating that calcium and H+ transport were linked, possibly by a mechanism involving a H+/Ca++ exchanger. Cadmium had no apparent effect on calcium absorption until cadmium concentrations reached levels at which nonspecific, cytotoxic effects were observed. In another separate project, initial research efforts were undertaken to use electron paramagnetic resonance (EPR) to explain the mechanism by which endothelial/smooth muscle cells release the putative endothelium-derived relaxing factor (EDRF), nitric oxide (NO), from vasodilator drugs. BIOEFFECTS OF RADIOFREQUENCY RADIATION ON CELL GROWTH AND DIFFERENTATION. VOLUME 1: ENGINEERING CONSIDERATIONS Final Report, Jan. 1988 - Oct. 1991
David L. Banks, Wesley W. Shelton, and James C. Toler Jun. 1993 42 p
(Contract F33615-83-K-0600)
(AD-A267754; AL-TR-1992-0106-Vol-1) Avail: CASI HC A03/MF A01

This report details the engineering considerations of a program designed to investigate the effects of chronic low-level radiofrequency radiation (RFR) exposure on cell growth and differentiation. The protocol required the exposure (1 mW/cm2 20 hours daily, average, 7 days per week) of 200 female, mammary-tumor-prone mice (strain C3H/HeJ) to 435-MHz pulsed-wave (1.0 us pulse width, 1.0 kHz pulse rate) RFR for a duration of 21 months. In addition, a sham-exposure group consisting of 200 female, C3H/HeJ mice was housed under identical conditions, but not exposed to the 435-MHz pulsed-wave radiation. The program's engineering considerations involved developing and providing the facility and equipment used to expose the mammary-tumor-prone mice and the development of a procedure for reliable identification of the mice. Also described are the design of the antenna and transmitter system, animal caging, cage washing procedures, and the data collection system. DTIC

THE 1990-1991 NASA SPACE BIOLOGY ACCOMPLISHMENTS
Thora W. Halstead, ed. (George Washington Univ., Washington, DC.) Oct. 1993 259 p
(NASA-TM-4501; NAS 1.15:4501) Avail: CASI HC A12/MF A03

This report consists of individual technical summaries of research projects of NASA's Space Biology Program, for research conducted during the period May 1990 through May 1991. This program includes both plant and animal research, and is dedicated to understanding the role of gravity and other environmental factors on biological systems and to using the microgravity of the space environment as a tool to advance fundamental scientific knowledge in the biological sciences to improve the quality of life on Earth and contribute to NASA's goal of manned exploration of space. The summaries for each project include a description of the research, a list of the accomplishments, an explanation of the significance of the accomplishments, and a list of publications. Author

REGULATION OF ATTACHED BACTERIAL GROWTH BY ADSORBED PROTEINS Final Report, 1 May 1990 - 30 Jun. 1993
David L. Kirchman 28 Jul. 1993 4 p
(Contract N00014-90-J-1973)
(AD-A267756) Avail: CASI HC A01/MF A01

The general objective of this project was to examine one component of the primary biofilm, protein, which has been hypothesized to be a major component of both dissolved and adsorbed organic pools in seawater. In previous work we found that surface energy was important in determining adsorption of protein to surfaces in seawater and degradation rates by bacteria and bacterial growth. In the last phase of this work, we examined the chemical nature of actual protein in seawater using HPLC techniques which we developed, standard chemical assays, and bioassays. We showed that protein in seawater is not the same chemically as cellular protein. Bacteria appear to treat nearly all seawater protein as if it were glycolated and degrade it at much lower rates than unmodified, fresh protein. Other experiments showed that cellular protein introduced into seawater is quickly modified by abiotic reactions and becomes less easily hydrolyzed by bacterial proteases within hours. The abiotic reactions appear to include adsorption to small colloids. These results begin to explain the growth dynamics of microorganisms on surfaces and the origin of refractory organic matter which is highly abundant in seawater. DTIC

THE DYNAMICS OF HYDROPONIC CROPS FOR SIMULATION STUDIES OF THE CELSS INITIAL REFERENCE CONFIGURATIONS Final Report, 1 Apr. 1989 - 31 Aug. 1993
Tyler Volk 31 Aug. 1993 45 p
(Contract NCC2-608)
(NASA-CR-194654; NAS 1.26:194654) Avail: CASI HC A03/MF A01

During the past several years, the NASA Program in Controlled Ecological Life Support Systems (CELSS) has continued apace with crop research and logistic, technological, and scientific strides. These include the CELSS Test Facility planned for the space station and its prototype Engineering

Development Unit, soon to be active at Ames Research Center (as well as the advanced crop growth research chamber at Ames); the large environmental growth chambers and the planned human test bed facility at Johnson Space Center; the NSCORT at Purdue with new candidate crops and diverse research into the CELSS components; the gas exchange data for soy, potatoes, and wheat from Kennedy Space Center (KSC); and the high-precision gas exchange data for wheat from Utah State University (USU). All these developments, taken together, speak to the need for crop modeling as a means to connect the findings of the crop physiologists with the engineers designing the system. A need also exists for crop modeling to analyze and predict the gas exchange data from the various locations to maximize the scientific yield from the experiments. One fruitful approach employs what has been called the 'energy cascade'. Useful as a basis for CELSS crop growth experimental design, the energy cascade as a generic modeling approach for CELSS crops is a featured accomplishment in this report. The energy cascade is a major tool for linking CELSS crop experiments to the system design. The energy cascade presented here can help collaborations between modelers and crop experimenters to develop the most fruitful experiments for pushing the limits of crop productivity. Furthermore, crop models using the energy cascade provide a natural means to compare, feature for feature, the crop growth components between different CELSS experiments, for example, at Utah State University and Kennedy Space Center. AN APPARATUS FOR MEASURING THE BIOLOGICAL OXIDATION OF HYDROGEN GAS UNDER HYPERBARIC CONDITIONS
S. R. Kayar, G. S. Goehring, W. E. Long, Jr., and A. L. Harabin Jun. 1993 35 p
(DA Proj. MR0-4101)
(AD-A266834; NMRI-93-38) Avail: CASI HC A03/MF A01

An apparatus was designed, constructed, and operated to permit us to expose mammalian tissues to high pressures and concentrations of hydrogen (H2), using the radioisotope tritium (T2) as a label. As part of a study of H2 as a breathing gas for deep diving, it was necessary to determine if mammalian tissues have a latent capacity to metabolize H2 that is only evident under hyperbaric conditions. The apparatus was designed to store up to 1 Curie T2 between experiments, mix T2 and H2 with air in the experimental chamber without producing an explosive mixture, and reclaim the T2 at the end of the experiment for safe disposal. The T2 was purchased in glass ampules. Storage of T2 was accomplished by placing the T2 ampule in a steel pressure chamber and breaking the ampule to release the T2 under complete containment. The potential problems from explosivity were solved by diluting the T2 and H2 with helium. Reclamation of the T2 was accomplished by passing a controlled stream of the T2 and H2 along with a controlled stream of air through a combustion trap. DTIC

A MATHEMATICAL MODEL FOR THE STUDY OF HEMORRHAGIC SHOCK AND FLUID RESUSCITATION: THE SYSTEMIC AND PULMONARY VASCULATURE Final Report No. 479
Tammy J. Doherty Jun. 1993 24 p
(AD-A266835) Avail: CASI HC A03/MF A01

In systemic and pulmonary circuit models, the number and configuration of vascular compartments may affect predictions of vascular volume and blood flow. Various models of the pulmonary and systemic vascular circuits are considered to identify models appropriate for studies of hemorrhage and fluid resuscitation. It was found that at least one pulmonary vascular compartment, made up of one resistance and one capacitance element, was required to describe the response of pulmonary blood volume to changes in pulmonary inflow rate (i.e., right heart output). Incorporation of additional pulmonary vascular segments did not altar predictions of pulmonary volume or flow rate. Therefore, one lumped pulmonary vascular compartment appears to be sufficient. It may be necessary to incorporate multiple pulmonary vascular segments, however, for studies of pulmonary transcapillary exchange or cardiovascular control. The initial model for the systemic circuit included a separate capillary compartment for studies of transcapillary exchange as well as variable resistance and compliance elements for studies of cardiovascular control. Model identification for the systemic circulation focused on the most appropriate number of parallel vascular pathways for predicting the response of systemic outflow (i.e., venous return) to changes in systemic inflow (i.e., left heart output). At least two separate parallel pathways were required to predict systemic outflow rate because of differences in the distribution time constant between skeletal muscle and other vascular beds. DTIC

VALIDATION OF RESPIRATORY INDUCTIVE PLETHYSMOGRAPHY FOR MEASURING EXERCISE TIDAL VOLUMES Final Report, Nov. 1991 - Jun. 1992
David M. Caretti, Paul V. Pullen, Leslie A. Premo, and Wade D. Kuhlmann May 1993 25 p
(AD-A266883; ERDEC-TR-078) Avail: CASI HC A03/MF A01

This study validated the accuracy of tidal volume (V(sub T)) measurements obtained with a respiratory inductive plethysmograph (RIP) to determine its reliability for measuring ventilation during studies of exercise and respirator wear. Values from the RIP were compared with simultaneous flowmeter volumes in 8 healthy subjects at 5 incremental work rates (60, 90, 120, 150, and 180 W) of cycling and treadmill exercise. During cycling, average RIP and flowmeter values did not differ significantly at work rates below 180 W for 5 of the 8 subjects. Average RIP and flowmeter V(sub T) were similar at work rates below 150 W for 5 of the 6 subjects who completed the treadmill iteration. The variability in these results may be attributed to several factors including RIP calibration errors and slippage of the RIP elastic bands containing the inductive coils. Correlations of breath-by-breath flowmeter and RIP V(sub T) were significant for each subject during cycling and treadmill exercise. These findings suggest that the RIP can provide reliable, noninvasive measurements of ventilation during exercise with and without respirator wear. Author (revised)

SLEEP MANAGEMENT USER'S GUIDE FOR SPECIAL OPERATIONS PERSONNEL Final Report
Paul Naitoh and Tamsin Kelly Jul. 1992 47 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A267746; NHRC-92-28) Avail: CASI HC A03

The objective of sleep logistics is to ensure that fighting men and women at all levels obtain sufficient sleep to maintain combat effectiveness. Special warfare missions frequently involve night work and arduous operational schedules. This User's Guide explains selected sleep management techniques for use during military operations, with particular emphasis on special operations mission. The guide will assist field commanders in using sleep logistics to prevent compromise of mission accomplishment due to sleep deprivation. In addition, it provides techniques for assessing severity of sleep debt and compensating for its ill effects. DTIC

MONOGRAPH OF THE AVIATION EPIDEMIOLOGY DATA REGISTER FOR FY 1991 Final Report
Robert H. Schrimsher and S. G. Shannon Jan. 1993 117 p
(DA Proj. 3M1-62787-A-879)
(AD-A266896; USAARL-93-12) Avail: CASI HC A06/MF A02

The purpose of this monograph was to provide descriptive statistics within the Aviation Epidemiology Data Register (AEDR) of selected variables from an aviator's annual class 2 or class 2A Flying Duty Medical Examination (FDME) that was performed in 1991. Only aviators from a major Army

component were considered, active duty, reserve, or National Guard. Descriptive data are presented in tables, which normally are defined by component, age group, and gender. Due to the small number of female aviators, some of the age-group cells are sparsely populated, especially within the reserve component. The data were organized into three areas: laboratory/clinical, vision, and hearing. Within the laboratory/clinical area, age was correlated with increases in mean values and percentages of population with values over a threshold for systolic and diastolic blood pressure, pulse, and cholesterol. Within the vision area, the likelihood of corrective lens use increased with age. For males, visual acuity decreased for both distant and near vision. DTIC

AUTOGENIC-FEEDBACK TRAINING (AFT) AS A PREVENTIVE METHOD FOR SPACE MOTION SICKNESS: BACKGROUND AND EXPERIMENTAL DESIGN
Patricia S. Cowings and William B. Toscano (California Univ., Los Angeles.) Aug. 1993 16 p Sponsored by NASA, Washington
(RTOP 199-70-12-14)
(NASA-TM-108780; A-93095; NAS 1.15:108780) Avail: CASI HC A03/MF A01

Finding an effective treatment for the motion sickness-like symptoms that occur in space has become a high priority for NASA. The background research is reviewed and the experimental design of a formal life sciences

shuttle flight experiment designed to prevent space motion sickness in shuttle crew members is presented. This experiment utilizes a behavioral medicine approach to solving this problem. This method, Autogenic-Feedback Training (AFT), involves training subjects to voluntarily control several of their own physiological responses to environmental stressors. AFT has been used reliably to increase tolerance to motion sickness during ground-based tests in over 200 men and women under a variety of conditions that induce motion sickness, and preliminary evidence from space suggests that AFT may be an effective treatment for space motion sickness as well. Proposed changes to this experiment for future manifests are included. Author (revised)

EXPERIMENTAL EVALUATION OF AN ADAPTIVE FOCUSING ALGORITHM FOR A MICROWAVE PLANAR PHASED-ARRAY HYPERTHERMIA SYSTEM AT UCSF
Alan J. Fenn, Chris J. Diederich, and Paul R. Stauffer 17 May 1993 52 p
(Contract F19628-90-C-0002)
(AD-A267004; TR-977; ESC-TR-92-203) Avail: CASI HC A04/MF A01

An adaptive focusing microwave planar phased-array hyperthermia system for improved heating of superficial tumors is experimentally investigated. A commercial microwave hyperthermia planar phased-array antenna system at the University of California at San Francisco (UCSF) Radiation Oncology Department has been modified to implement a gradient-search adaptive focusing algorithm. Adaptive focusing measurements in a muscle-equivalent liquid phantom with a 915-MHz microwave planar phased-array hyperthermia system comprising 16 independent amplitude/phase-controlled waveguide antenna elements (Microtherm-1000, Labthermics Technologies, Inc.) are reported. An electric-(E-)-field feedback probe detector, fabricated at UCSF, measures the E-field generated by the hyperthermia phased array. A method of steepest-ascent gradient-search feedback algorithm, implemented in software, controls the hyperthermia array phase shifters and focuses the transmitted radiation beam. In 10 to 15 iterations, the measured phantom data indicate rapid convergence of the adaptive focusing algorithm and significant increase of the focal region field strength due to the adaptive focusing. Two-dimensional E-field radiation pattern measurements were collected by scanning the E-field dipole probe antenna inside the muscle-equivalent liquid phantom. The measured, adaptively phase-focused radiation pattern data indicate a maximum useful heating depth of about 3 cm in a muscle-equivalent sugar/saline phantom having dielectric losses of 3 dB/cm. TOXIC SUBSTANCES REGISTRY SYSTEM: INDEX OF MATERIAL SAFETY DATA SHEETS
Oct. 1993 915 p
(NASA-TM-109332; NAS 1.15:109332; GP-23-1) Avail: CASI HC A99/MF A10

The Material Safety Data Sheets (MSDS's) listed in this index reflect product inventories and associated MSDS's which were submitted to the Toxic Substances Registry database maintained by the Base Operations Contractor at the Kennedy Space Center. The purpose of this index is to provide KSC government, contractor, and tenant organizations a means to access information on the hazards associated with these chemicals. The Toxic Substance Registry Service (TSRS) was established to manage information dealing with the storage and use of toxic and otherwise hazardous materials at KSC. As a part of this service, the BOC Environmental Health Services maintains a central repository of MSDS's which were provided to TSRS. The data on the TSRS are obtained from NASA, contractor, and tenant organizations who use or store hazardous materials at KSC. It is the responsibility of these organizations to conduct inventories, obtain MSDS's, distribute Hazard Communication information to their employees, and otherwise implement compliance with appropriate Federal, State, and NASA Hazard Communication and Worker Right-to-Know regulations and policies. DIFFUSIBLE DRIVING AND COUPLING SIGNALS OF THE BIOLOGICAL CLOCK Annual Report, 1 Apr. 1992 - 31 Mar. 1993
Rae Silver and Joseph LeSauter 18 May 1993 12 p
(Contract F49620-92-J-0195)
(AD-A267046; AFOSR-93-0548TR) Avail: CASI HC A03/MF A01

It is well established that the mammalian suprachiasmatic nucleus (SCN) is a biological pacemaker which entrains the activity of organisms to their environment and controls circadian rhythmicity. However, neither the nature of these coupling signal(s) from the SCN, nor their target(s) in the brain are well understood. Fiber efferents from the SCN reach nearby hypothalamic regions, suggesting a coupling role for neural efferent pathways. The SCN produces diffusible signals that reach nearby hypothalamic sites and the cerebrospinal fluid, suggesting a role for a diffusible efferent pathway. We consider the possibility of redundant coupling signals of the SCN and review evidence suggesting that diffusible elements may-be sufficient to sustain locomotor rhythmicity in adult animals and to restore locomotor rhythmicity in lesioned hamsters bearing SCN grafts. We also provide data for the occurrence of signals that synchronize oscillators irrespective of initial phase. The distinct role of neural and diffusible SCN coupling signals and the role of SCN-driven systems (pineal melatonin rhythms, body temperature) remains to be explored. DTIC

RELIABILITY OF AUTONOMIC RESPONSES AND MALAISE ACROSS MULTIPLE MOTION SICKNESS STIMULATION TESTS
Cynthia S. Stout, William B. Toscano (California Univ., Los Angeles.), and Patricia S. Cowings Sep. 1993 10 p Sponsored by NASA, Washington
(RTOP 199-70-12-14)
(NASA-TM-108787; A-93118; NAS 1.15:108787) Avail: CASI HC A02/MF A01

There is general agreement that a high degree of variability exists between subjects in their autonomic nervous system responses to motion sickness stimulation. Additionally, a paucity of data exists that examines the variability within an individual across repeated motion sickness tests. Investigators have also examined the relationship of autonomic responses to motion sickness development. These investigations have used analyses at discrete points in time to describe this relationship. This approach fails to address the time course of autonomic responses and malaise development throughout the motion sickness test. Our objectives were to examine the reliability of autonomic responses and malaise using the final minute of the motion sickness test across five testing occasions, to examine the reliability of the change in autonomic responses and the change in malaise across five testing occasions, and to examine the relationship between changes in autonomic responses and changes in malaise level across the entire motion sickness test. Our results indicate that, based on the final minute of testing, the autonomic responses of heart rate, blood volume pulse, and respiration rate are moderately stable across multiple tests. Changes in heart rate, blood volume pulse, respiration rate, and malaise throughout the test duration were less stable across the tests. We attribute this instability to variations in individual susceptibility and the error associated with estimating a measure of autonomic gain. Author

CUMULATIVE EFFECT OF REPEATED BRIEF CEREBRAL ISCHEMIA Final Report, 1 Jun. 1992 - 31 May 1993
Hoby Hetherington 31 May 1993 34 p
(Contract F49620-92-J-0362)
(AD-A267155; AFOSR-93-0459TR) Avail: CASI HC A03/MF A01

The purpose of this grant is to investigate the metabolic and physiological factors determining the extent of ischemic damage in a model of brief repetitive ischemia. The model is intended to simulate the effects of Gz induced blackout experienced by fighter pilots undergoing high gravitational stress maneuvers. To achieve this goal a rat model was developed whereby ischemia could be induced remotely (under computer regulation) by inflation of occlusive cuff about the common carotid artery of the rat. Metabolic parameters were determined by performing in vivo NMR measurements throughout the repetitive ischemic insult. The non-destructive nature of the NMR measurement permits complete time courses to be monitored in each animal thereby minimizing animal variability. NMR measurements of metabolite content are then used in conjunction with histologic evaluations of neuronal death to assess which metabolic factors have the strongest influence on ischemic damage. During the past year we have completed our studies: (1) investigating the correlations between EEG, phosphocreatine (PCr), adenosine triphosphate (ATP), inorganic phosphate (P), pH and lactate as a function of increasing ischemic severity in our model of brief repetitive ischemia and (2) characterizing substrate utilization and lactate clearance curves using the same model. These experiments have been performed in the rat brain using the repetitive ischemia model with in vivo NMR to measure metabolite content. DTIC

A REVIEW OF THE EFFICACY OF 7.5 PERCENT NaCl/6 PERCENT DEXTRAN-70 (HSD) IN EXPERIMENTAL ANIMALS AND HUMANS
M. A. Dubick and C. E. Wade Jan. 1993 31 p
(AD-A266633; LAIR-IR-481) Avail: CASI HC A03/MF A01

Recent years have seen a renewed interest in the use of hypertonic-hyperoncotic solutions as plasma volume expanders for the treatment of hemorrhagic hypotension. In particular, a number of studies in experimental animals have addressed the efficacy and safety of small volume infusions of 7.5% NaCl/6% Dextran-70 (HSD). Employing models of fixed volume or fixed pressure hemorrhage, HSD has improved survival, and reversed many of the hemodynamic, hormonal, and metabolic abnormalities associated with hemorrhagic shock. In the few human field trials completed to date, HSD has been shown to be potentially beneficial in hypotensive trauma patients who require surgery or have concomitant head injury. Extensive toxicological evaluations and lack of reports of adverse effects in the human trials indicate that, at the proposed therapeutic dose of 4 ml/kg, HSD should present little risk. DTIC

THE RELATIONSHIP OF METALLOTHIONEIN INDUCTION TO THE HEAT SHOCK RESPONSE
J. M. Yang, P. D. Bowman, M. A. Deaton, S. T. Schuschereba, and B. E. Stuck Apr. 1993 46 p
(AD-A266634; LAIR-IR-480) Avail: CASI HC A03/MF A01

Heat shock proteins (hsp's) and Metallothioneins (MT's) are sets of proteins specifically synthesized by cells in response to sublethal injury such as heat, heavy metals, or radiation. This dissertation investigated the relationship of metallothionein induction to the heat shock response. Sodium arsenite, which induces both hsp's and MT's was used to establish a model system for investigation. Electrophoresis conditions that allowed simultaneous identification and quantitation of hsp's and MT's were then developed. Identification of MT's was achieved by (S-35) cysteine and methionine labeling and (Cd-109)-binding. The results of this study indicate that MT's undergo increased synthesis following both heat shock and sodium arsenite treatment. The level of increase of MT's after heat shock was about one-tenth of the increase after sodium arsenite treatment. These results suggest that MT's are heat shock and stress proteins. DTIC

FLIGHT SIMULATOR-INDUCED SICKNESS AND VISUAL DISPLAYS EVALUATION Final Report, Oct. 1989 - Jan. 1992
Harold D. Warner May 1993 102 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-90-C-0005)
(AD-A267019; AL/HR-TR-1993-0056) Avail: CASI HC A06

The objectives of this investigation were to compare the incidence and severity of simulator sickness associated with the use of two flight simulator visual systems and to evaluate the performance characteristics of the visual displays. The visual systems were the Display for Advanced Research and Training (DART) and the Limited Field-of-View Dome (LFOVD). Two groups of pilots served as subjects. One group consisted of active duty U.S. Air Force instructor pilots. The second group was comprised of pilots who were no longer flying military aircraft. The pilots performed a series of single-ship and formation flights, and an F-16 simulated fighter aircraft was used in conjunction with both visual systems. It was observed that both visual systems induced simulator sickness symptoms, and some of the pilots were forced to prematurely terminate the flights due to severe discomfort. For the pilots who were able to complete the flights, there was a significant increase in self reports of discomfort over time, an increase in simulator sickness symptomatology, and a decline in postural equilibrium. However, there were no differences in the incidence of simulator sickness between the two visual systems or pilot groups. The pilots recovered from the adverse effects of the simulation within 30 min following the flights. The means and medians of the pilots' ratings of the visual display characteristics indicated that the only problems encountered with the two visual systems were the resolution of the peripheral field and the vertical excursion limits of the high-resolution inset for the LFOVD. CENTER OF EXCELLENCE IN LASER MEDICINE
J. A. Parrish 29 Apr. 1993 6 p
(Contract DE-FG02-91ER-61228)
(DE93-016541; DOE/ER-61228/T1) Avail: CASI HC A02/MF A01

Achievements during the last 12 months of funding to initiate a Center of Excellence in biomedical laser development include the following: seven specific research projects within the Center's three broad interest areas; and program development to establish the MGH Laser Center and its activities. Progress is reported in three areas of interest: new medical laser systems development; optical diagnostics; and photo sensitization. Feasibility studies and prototype development were emphasized, to enhance establishing a substantial Center through future support. Specific projects are outlined. In addition, the interdepartmental MGH Laser Center's activities and accomplishments are reported. DOE

A MATHEMATICAL MODEL FOR THE STUDY OF HEMORRHAGIC SHOCK AND FLUID RESUSCITATION: TRANSCAPILLARY EXCHANGE Final Report, 1989 - 1993
Tammy J. Doherty Mar. 1993 37 p
(AD-A266427; LAIR-477) Avail: CASI HC A03/MF A01

Mathematical models used to predict plasma volume responses to hemorrhage and fluid resuscitation must consider both fluid and solute exchange across the capillary wall. In this paper, we review four models of transcapillary exchange that might be incorporated into a compartmental model for plasma volume prediction. The simplest of the four transcapillary flux models assumes a discrete capillary wall structure, ideal solutions, and capillary wall homogeneity. The remaining models become progressively more complex by successive elimination of these three assumptions. To assess their effects on whole-body plasma volume predictions, the four models of transcapillary exchange were incorporated into a simple two-compartment (blood and interstitial space) model. Next, plasma volume predictions were generated for the following simulation conditions: instantaneous 25% loss of blood volume, instantaneous 50% increase in plasma NaCl concentration, instantaneous 50% increase in plasma albumin concentration, and instantaneous 25% loss of blood volume with a 50% increase in plasma NaCl concentration. Plasma volume predictions, generated by the four models, were indistinguishable over these simulation conditions. From these results, we conclude that the simplest of the transcapillary flux models may be used for predicting plasma volume responses to hemorrhage and resuscitative fluid administration. DTIC

A MATHEMATICAL MODEL FOR THE STUDY OF HEMORRHAGIC SHOCK AND FLUID RESUSCITATION: EXCHANGE OF FLUID AND SOLUTES BETWEEN VASCULAR, INTERSTITIAL, AND TISSUE CELL COMPARTMENTS Final Report, 1989 - 1993
Tammy J. Doherty Jun. 1993 26 p
(AD-A266426; LAIR-478) Avail: CASI HC A03/MF A01

The transfer of fluid from extravascular compartments into the vasculature is an important recovery mechanism for hemorrhage. This paper describes a three-compartment model (i.e., vascular, interstitial, and tissue cell) that predicts intra-extravascular fluid exchange following hemorrhage and fluid resuscitation. This three-compartment model assumes that capillary pressure is a linear function of blood volume, that interstitial pressure is a nonlinear function of extravascular volume, and that lymph flow is a function of interstitial pressure. Starting with this simple three-compartment model, the effects of model assumptions on plasma volume predictions were assessed. By varying model assumptions and comparing plasma volume predictions, we determined that separate tissue cell and interstitial compartments were required for predicting the plasma volume response to infusions of resuscitative solutions containing small, permeable solutes (e.g., NaCl). We also determined that the interstitial space could be described by a constant hydrostatic pressure, that considerations of interstitial exclusion volumes were not required, and that lymph flow could be considered constant. Plasma volume predictions generated by the three-compartment model were also compared to observed plasma volumes for validation. DTIC

EVALUATION OF HEMOGLOBIN-OXYGEN EQUILIBRIUM BINDING BY RAPID-SCANNING SPECTROPHOTOMETRY AND SINGULAR-VALUE DECOMPOSITION
Kim D. Vandegriff and Richard I. Shrager 8 Mar. 1993 21 p
(AD-A266453) Avail: CASI HC A03/MF A01

A review of a new method to measure oxygen equilibrium binding to hemoglobin solutions by rapid-scanning spectrophotometry is presented. State-of-the-art technologies are reviewed and compared. The new method is based on rapid-scanning spectrophotometry that is used to resolve directly unique optical transitions during continuous hemoglobin oxygenation. Mathematical techniques for matrix multicomponent analysis and singular value decomposition (SVD) are described, and spectral artifacts that are resolved by these sensitive techniques are discussed. INCREASED VASCULAR RESISTANCE WITH HEMOGLOBIN-BASED OXYGEN CARRIERS
J. R. Hess, V. W. MacDonald, C. S. Gomez, and V. Copper 1993 13 p
(AD-A266454) Avail: CASI HC A03/MF A01

The purpose of this project was as follows: to compare the effects of resuscitation with hemoglobin-based oxygen-carriers and conventional crystalloid and colloid resuscitation fluids on hemodynamics, oxygen transport, and oxygen consumption in an animal model of the field medical use of these fluids in the treatment of hemorrhagic shock. Twenty-eight immature swine were tested in accordance with the following protocol: they were surgically prepared; allowed to recover five days; water deprived for 48 hours; hemorrhaged of 25 ml/kg over one hour; resuscitated promptly with (1) Ringer's lactate, 75 ml/kg, (2) 7% albumin in Ringer's acetate, 25 ml/kg, (3) 9% unmodified hemoglobin in Ringer's acetate, 25 ml/kg, or (4) 9% alpha alpha-crosslinked hemoglobin in Ringer's acetate, 25 ml/kg; observed with three hours of hemodynamic and oxygen transport measurements; and, finally, blood which had been removed previously was returned. NEW HEALTH AND SAFETY INITIATIVES AT THE DEPARTMENT OF ENERGY (DOE)
Paul L. Ziemer *In* BioTechnology, Inc., Proceedings of the 1992 Annual Meeting NASA Occupational Health Program Jul. 1993 p 9-26 (For primary document see N94-16609 03-52)
Avail: CASI HC A03/MF A03

This document touches on some of the more important lessons learned and the more noteworthy initiatives DOE has put into motion in the last three years to protect the health and safety of our contractor employees. What we have learned in the process should come as no surprise to those of you who have been working in the field: (1) that management commitment to safety and health is critical to a successful program; (2) that meaningful employee participation in all aspects of the program enhances its effectiveness at every level; and (3) that the dedication and expertise of medical and occupational safety and health professionals are needed if the challenging problems presented by the complex and technologically advanced environment at DOE facilities are to be overcome. I believe that we have made a good beginning in the long and arduous task of building an Occupational Safety and Health Program that will serve as a model for others, and I can assure you that we intend to continue our efforts to protect every worker within the complex from occupational injury and disease. AMERICANS WITH DISABILITIES ACT CONSIDERATIONS FOR THE PRACTICE OF OCCUPATIONAL MEDICINE
Steven St.Clair and Theodore Shults (Shults and Associates, Chapel Hill, NC.) *In* BioTechnology, Inc., Proceedings of the 1992 Annual Meeting NASA Occupational Health Program Jul. 1993 p 27-43 (For primary document see N94-16609 03-52)
Avail: CASI HC A03/MF A03

The Americans with Disabilities Act (ADA), although developed in the context of civil rights legislation, is likely to have notable impact on the practice of occupational medicine. The ADA contains provisions limiting the use of preplacement examinations to determinations of the capability to perform the essential functions of the job and of direct threat to the health and safety of the job applicant and others. The Title 1 employment provisions of the ADA established definitions and requirements similar to those found in section 504 of the Rehabilitation Act of 1973, as amended; leading cases that have been litigated under the Rehabilitation Act, as amended, are described. The limitations of available scientific and medical information related to determinations of job capability and direct threat and ramifications of the ADA on the practice of occupational medicine are discussed. The Federal Drug Free Work Place Program (DFWP) has now matured to the point of being able to return employees to sensitive testing designated positions (TDP) after completion of treatment of their addiction. The known tendency of addicted individuals to suffer multiple relapses prior to their final recovery has resulted in several positive urine tests (relapses) occurring among those Federal employees who have already completed treatment and who have been returned to TDP's. The very real potential for further relapses occurring after additional employees return to TDP's will be a critical factor in the ultimate success of the DFWP and in the public's impression of the program's effectiveness. In response to this concern, NASA has begun development of its Ongoing Recovery Basic Information Tool (ORBIT) instrument. The aim of the NASA ORBIT is to provide Employee Assistance Program (EAP) professionals with an advanced clinical tool which will be helpful in supporting recovery from substance abuse and which will allow more accurate determinations of when clients may be successfully returned to sensitive positions. During the processing of the Space Shuttle Solid Rocket Booster (SRB), segments at the Kennedy Space Center, an odor was detected around the solid propellant. An Industrial Hygiene survey was conducted to determine the chemical identity of the SRB offgassing constituents. Air samples were collected inside a forward SRB segment and analyzed to determine chemical composition. Specific chemical analysis for suspected offgassing constituents of the propellant indicated ammonia to be present. A gas chromatograph mass spectroscopy (GC/MS) analysis of the air samples detected numerous high molecular weight hydrocarbons. Author

On July 31, 1991, EG&G Medical began providing medical support at the Titan Area Clinic (TAC). The hours of operation are 0700-2300, Monday through Friday, with Emergency Medical Services (EMS) provided 24-hours a day, seven days a week. The TAC consists of a 10 x 10 ft section of a trailer that also houses Bechtel Safety. Supplies consisted of an examining table, an eye wash chair, first aid equipment, over-the-counter medications, spine boards, a portable rescuscitator, etc. All of the nurses are Advanced Cardiac Life Support (ACLS) certified. Although the Titan Area Clinic is strictly a first-aid station with no ACLS facilities on-site, it is staffed with an Occupational Health Nurse with ACLS certification. If ACLS or additional help is needed, the nurse activates EMS by dialing 911. The nurse responds to any medical problems or emergencies on the complex, but activates EMS prior to leaving the TAC. A Bechtel Safety Representative accompanies the nurse to the site and assists as needed. Other aspects of the complex and its functions are presented. Derived from text

There were two isolated episodes of LeRC workers who were diagnosed with pulmonary tuberculosis (TB) during the fall of 1990. The specifics surrounding each case were very different, and it is clear that the two episodes were completely unrelated. The fact that the final diagnoses of pulmonary tuberculosis came within three weeks of each other was purely coincidental. The Occupational Medicine Service (OMS) conducted separate informational sessions and offered free PPD skin testing to all employees, both NASA and contractors, who felt that they were at risk of having been exposed to tuberculosis from either individual. The procedures and results of these are briefly discussed.

Despite recent advances in both the survival and cure rates for many forms of cancer, unfortunately the same has not been true for prostate cancer. In fact, the age-adjusted death rate from prostate cancer has not significantly improved since 1949, and prostate cancer remains the most common cancer in American men, causing the second highest cancer mortality rate. Topics discussed include the following: serum testosterone levels; diagnosis; mortality statistics; prostate-sppecific antigen (PSA) tests; and the Occupational Medicine Services policy at LeRC.

The Ames Fitness Program services 5,000 civil servants and contractors working at Ames Research Center. A 3,000 square foot fitness center, equipped with cardiovascular machines, weight training machines, and free weight equipment is on site. Thirty exercise classes are held each week at the Center. A weight loss program is offered, including individual exercise prescriptions, fitness testing, and organized monthly runs. The Fitness Center is staffed by one full-time program coordinator and 15 hours per week of part-time help. Membership is available to all employees at Ames at no charge, and there are no fees for participation in any of the program activities. Prior to using the Center, employees must obtain a physical examination and complete a membership package. Funding for the Ames Fitness Program was in jeopardy in December 1992; however, the employees circulated a petition in support of the program and collected more than 1500 signatures in only three days. Funding has been approved through October 1993.

OSHA BLOODBORNE PATHOGENS STANDARDS EXPOSURE CONTROL PLAN
Caro Elise Luhrs and Rita Teitelbaum *In* BioTechnology, Inc., Proceedings of the 1992 Annual Meeting NASA Occupational Health Program Jul. 1993 p 313-327 Revised (For primary document see N94-16609 03-52)
Avail: CASI HC A03/MF A03
The Hummer Associates Exposure Control Plan is designed to reduce significant occupational exposure to bloodborne pathogens and infectious materials for Hummer Associates health care personnel. Under universal precautions, all patients and all body fluids are considered potentially infectious for bloodborne pathogens. Medical personnel need not be at increased risk if universal precautions are correctly understood and followed. This program covers all employees who could reasonably anticipate contact with blood or other potentially infectious materials during the performance of their job responsibilities. Although HIV and hepatitis B are mentioned most often, this program applies to all bloodborne diseases. The two main components needed to implement this program are universal precautions

and engineering/work practice controls. This program covers all employees who may have occupational exposure to blood or other potentially infectious materials. Other aspects of this program are discussed. Derived from text

WOUND HEALING AFTER LASER INJURY TO SKIN: THE EFFECT OF OCCLUSION AND VITAMIN E Final Report
Gad A. Simon, Peter Schmid, William G. Reifenrath, Theodore VanRavenswaay, and Bruce E. Stuck May 1993 36 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A266473) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The skin of the Yorkshire pig was irradiated with various doses of argon and copper vapor laser and evaluated for effects on healing time of pretreatment with topical or intramuscular vitamin E or the Op-Site wound dressing. Incident irradiance for both lasers was between 3.5 and 4.5 watts/cm(sup 2) for a 10-14 mm beam diameter with a near uniform intensity profile. Minimal erythemic dose for the copper vapor laser was 35 +/- 2 J/cm(sup 2) (10 second exposure) and 22.4 +/- 0.1 J/cm(sup 2) (6 second exposure) for the argon laser. Three dose levels were administered: a low dose causing light erythema, an intermediate dose, and a high dose causing dermal stasis. Exposure to argon and copper vapor lasers generally caused wounds with similar healing times. Healing time was significantly decreased for wounds caused by intermediate exposure of the copper vapor laser and either pretreated with vitamin E or treated with the wound dressing. Healing times for corresponding argon laser exposure were significantly decreased with pretreatment of intramuscular vitamin E only or after treatment with the wound dressing. These findings may be valuable in selecting treatment for accidental laser skin injuries in man. DTIC

THE NATURE OF DYNAMIC ARTERIOLAR VASOREACTIVITY: A MINI-REVIEW AND A CLASSIFICATION SCHEME Final Report
K. E. Arfors, M. Intaglietta, S. P. Bruttig, P. Borgstrom, and J. A. Schmidt 8 Jun. 1993 28 p
(AD-A266499; LAIR-IR-482) Avail: CASI HC A03/MF A01

Changes in microvascular caliber are frequently observed both during normal, resting physiological conditions, as well as during physiologic stresses such as hemorrhage and fluid volume resuscitation. Many of the dynamic changes have been described with the singular term vasomotion. However, many types of frequently observed vasomotive behavior are a typical of either microvascular inactivity or vasomotion. This review describes a simple classification scheme for four types of arteriolar behavior observed routinely in our laboratory in the microvasculature of skeletal muscle of the anesthetized rabbit. These patterns include inactivity (static diameter of the open vessel which does not dynamically affect flow), vasoactivity (random, non-rhythmic changes in vessel diameter, which effect step-wise or non-rhythmic increases or decreases in flow), vasomotion (regular, rhythmic, repetitive constriction and dilation of arterioles with either a fast or slow period), and vessel closure (closure occludes flow entirely, and may divert flow to other adjoining microvascular beds). Although these patterns may not represent a functional continuum, each pattern of behavior is distinct in its effect on blood flow. Therefore, our study proposes a simple classification scheme, which will aid in understanding the dynamic response of the microvasculature to moderate or severe physiologic stress as well as the local, dynamic regulation of microcirculatory flow during pathophysiologic states. RELEASE OF IRON FROM HEMOGLOBIN
S. S. Panter 17 Feb. 1993 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A266503) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The measurement of free iron in hemoglobin solutions as well as the measurement of total hemoglobin-bound iron are important validation assays for large-scale production of hemoglobin-based oxygen carriers. In addition, the detection of iron released from hemoglobin by oxidation or reduction reactions provides information about the stability of iron in heme. These stability measurements may be important in the characterization of structurally modified hemoglobins and can be conducted using spectrophotometric assays based on ferrozine, a chelator of ferrous iron. Techniques for the measurement of free iron in hemoglobin solutions, total hemoglobin-bound iron, and iron released from hemoglobin are described in detail. DTIC

ENCAPSULATION OF HEMOGLOBIN IN NON-PHOSPHOLIPID VESICLES
K. D. Vandegriff, D. F. Wallach, and R. M. Winslow 1993 6 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A266505) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The efficiency of encapsulating hemoglobin in non-phospholipid liposomes by rapidly mixing hemoglobin with lipids heated above their solid-liquid phase transition temperature was examined. Human hemoglobin was mixed at 55-60 C with a lipid solution containing polyoxyethylene-2 cetyl ether and cholesterol (molar ratio, 3:1) at 60-65 C. Repeated mixing was carried out through a high-shear orifice, followed by rapid cooling and additional mixing. Lipid vesicles were heterogeneous in size, with diameters from approximately 300 nm to 10 micrometers. The non-encapsulated aqueous phase was removed by centrifugation, and total hemoglobin was determined spectrophotometrically. Encapsulation efficiency was calculated as the percentage of hemoglobin associated with the liposome phase (i.e., encapsulated) as a function of hemoglobin concentration and the aqueous:lipid hydration ratio. Hemoglobin concentrations were varied from 1 to 10 mM (in heme). Aqueous:lipid ratios of 8:1 and 4:1 were tested. Percent encapsulation varied from 13-30%, with the greatest efficiency, i.e., 30%, at a 4:1 hydration ratio of hemoglobin:lipid at 5.6 mM hemoglobin. DTIC

N94-16786 Letterman Army Inst. of Research, San Francisco, CA. Div. of Blood Research.
NEUROTOXICITY OF HEMOGLOBIN IN CORTICAL CELL CULTURE Final Report
Raymond F. Regan and S. S. Panter 23 Sep. 1992 37 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A266506) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Hemoglobin (Hb) has been demonstrated to be neurotoxic when injected into the cerebral cortex, in vivo. However, associated systemic factors such as ischemia and epileptogenesis have limited investigations of Hb toxicity in the intact central nervous system (CNS). In this study, the neurotoxicity of human Hb was assessed in mixed neuronal and glial neocortical cell cultures derived from fetal mice. Exposure of cultures to Hb for 24-28 hours produced widespread and concentration-dependent neuronal death (EC50 1-2.5 uM), without injuring glia. Brief exposures (1-2 hours) were not toxic. Neuronal death was completely blocked by the 21-aminosteroid U74500A, the antioxidant Trolox, and the ferric iron chelator deferoxamine. The results of these experiments suggest that, in this system, chromatographically pure Hb is a potent neurotoxin, and that Hb neurotoxicity may contribute to secondary injury processes after trauma and intracranial hemorrhage. QUANTIFYING LIFETIME EXPOSURE TO ULTRAVIOLET RADIATION IN THE EPIDEMIOLOGY OF CUTANEOUS MALIGNANT MELANOMA: A PILOT STUDY
C. S. Lea (California Univ., Berkeley.), S. Selvin (California Univ., Berkeley.), and P. A. Buffler (California Univ., Berkeley.) Oct. 1992 21 p
(Contract DE-AC03-76SF-00098)
(DE93-015274; LBL-32745) Avail: CASI HC A03/MF A01

This pilot study uses a unique method to calculate cumulative lifetime exposure to ultraviolet radiation-b (UVB) to determine if this refined method would indicate differences in lifetime cumulative UVB exposure between age and sex matched controls. Forty-four age and sex matched cases and controls demonstrated no significant difference in mean cumulative lifetime UVB exposure based on the duration and location of residence. This pilot study suggests that further analysis of the dataset should be conducted to

determine if the cumulative lifetime exposure hypothesis is of primary importance regarding the association between UVB exposure and development of cutaneous malignant melanoma. DOE

THE ROLE OF CONSTITUTIVE AND INDUCIBLE PROCESSES IN THE RESPONSE OF HUMAN SQUAMOUS CELL CARCINOMA CELL LINES TO IONIZING RADIATION
J. L. Schwartz 1993 13 p Presented at the Molecular, Genetics and Cellular Basis of Radiosensitivity at Low Doses Workshop, Vancouver, British Columbia, 9-13 May 1993
(Contract W-31-109-eng-38)
(DE93-015150; ANL/BIM/CP-79672; CONF-9305202-2) Avail: CASI HC A03/MF A01

The inherent radiation sensitivity of the cells within a tumor is thought to contribute to the success or failure of radiation therapy. In vitro studies have shown that radiation sensitivity differences in squamous cell carcinoma cell lines reflect alterations in DNA repair. These alterations result from constitutive changes in chromosome organization, not radiation-inducible processes. While inducible responses may play some role in the radiation response of tumor cells, there is no evidence for their involvement in inherent tumor cell radiosensitivity differences or in the success or failure of radiotherapy for squamous cell carcinomas. METHOD AND APPARATUS TO CHARACTERIZE ULTRASONICALLY REFLECTIVE CONTRAST AGENTS Patent Application
Robert A. Pretlow, III, inventor (to NASA) (Lockheed Engineering and Sciences Co., Hampton, VA.) 15 Nov. 1993 27 p
(NASA-Case-LAR-14969-1; NAS 1.71:LAR-14969-1;
US-Patent-Appl-SN-153930) Avail: CASI HC A03/MF A01

A method and apparatus for characterizing the time and frequency response of an ultrasonically reflective contrast agent is disclosed. An ultrasonically reflective contrast agent is injected, under constant pressure, into a fluid flowing through a pump flow circuit. The fluid and the ultrasonically reflective contrast agent are uniformly mixed in a mixing chamber, and the uniform mixture is passed through a contrast agent chamber. The contrast agent chamber is acoustically and axially interposed between an ultrasonic transducer chamber and an acoustic isolation chamber. A pulse of ultrasonic energy is transmitted into the contrast agent chamber from the ultrasonic transducer chamber. An echo waveform is received from the ultrasonically reflective contrast agent, and it is analyzed to determine the time and frequency response of the ultrasonically reflective contrast agent. NASA

CARPAL TUNNEL SYNDROME AND OTHER CUMULATIVE TRAUMA DISORDERS OF THE ARM AND HAND AND OCCUPATION IN US NAVY ENLISTED PERSONNEL Final Report, 1 Oct. 1991 - 30 Sep. 1992
F. C. Garland, C. F. Garland, E. J. Doyle, Jr., L. Balazs, and R. Levine 15 Feb. 1993 21 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A267747; NHRC-93-7) Avail: CASI HC A03

The majority of reported occupational illnesses in the United States are cumulative trauma disorders of the arm and hand due to repeated motion, vibration, or pressure; among these is carpal tunnel syndrome (CTS). The objectives of this study were to describe demographic factors associated with high rates of CTS and other nerve entrapment disorders and to identify high-risk Navy occupations. Computerized records of first hospitalizations of all Navy enlisted personnel for CTS and other nerve entrapment disorders (ICD-9-CM codes 354.0-354.9) were identified during 1980 to 1988. Age-, sex-, and race-specific incidence rates and age-standardized incidence rates were calculated. There were 493 first hospitalizations for CTS in 4,095,708 person-years in men and 90 in 365,668 person-years in women. Rates of CTS rose with age in both sexes. Rates in white women were about triple those in white men, but rates in black women were not significantly different from black men. In men, occupations with significantly high standardized incidence ratios (SIRs) for CTS included aviation support equipment technician, engineman, hull maintenance technician, boatswain's mate, and machinist's mate. In women they included boatswain's mate, engineman, hospital corpsman, ocean systems technician, and personnelman. Sex and race differences do not account for the occupations at highest risk. DTIC

AUTOMATED DATA COLLECTION SYSTEM FOR THE TCM3 TRANSCUTANEOUS pO2/pCO2 MONITORING SYSTEM Final Report, Jan. - Jun. 1993
Roxanne Constabe Aug. 1993 18 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268400; AL/DO-TP-1993-0025) Avail: CASI HC A03

The Hyperbaric Medicine Division of the Armstrong Laboratory (AL/AOHP) routinely uses the TCM3 Transcutaneous system for monitoring of patients and during research protocols. The monitor is used to measure the amount of oxygen/carbon dioxide at the skin surface. Up to 3 monitors may be utilized, and all data must be written down by hand at some interval. This method requires an individual to be watching the monitors at all times. If any further data analysis is to be performed, then the data must be entered into a computer by hand, or the manipulations are performed on paper. The purpose of this technical paper is to describe a data acquisition system designed to automate the collection and analysis of information processed by the TCM3 transcutaneous monitor. The hardware portion of the system is designed around a Macintosh 2 computer, and the software was written using LabVIEW 2. DTIC

MICROMECHANICS MODELING AND ANALYSIS OF HAVERSIAN COMPACT BONE TISSUES AS A FIBER REINFORCED COMPOSITE MATERIAL Annual Report, 1 Apr. 1992 - 31 Mar. 1993
Harry A. Hogan and Raymond J. DeFrese 30 Jun. 1993 35 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-92-J-0208)
(AD-A268250; AFOSR-93-0598TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This research is part of the recent AFOSR initiative in biomimetics, which has the broad overall goal of seeking to elucidate and understand the salient characteristics of naturally occurring biological composite materials with an aim toward mimicking these features in devising improved man-made composite materials. The biological composite of interest in this effort is bone tissue, or more specifically Haversian compact bone tissue. The main objective of the project is to develop a deterministic understanding of the relationships between microstructural details and macroscopic mechanical behavior. The unique fiber/matrix interphase material, which is distinctive of this type of bone tissue, is of particular interest because of the recognized significance of interfaces in developing new higher performance composites. The methodology combines composite micromechanics modeling techniques to analytically model structure/property relationships with companion experimental testing of tissue samples to evaluate and validate the modeling. Amniote circadian organization derives from the interactions of the circadian oscillator and photoreceptors located in the hypothalamic suprachiasmatic nuclei (SCN), the pineal gland, and the eyes. In mammals, circadian organization is dominated by the SCN, which serve as master pacemakers in the control of a wide array of behavioral and physiological rhythms (including locomotion, sleep-wake, thermoregulation, cardiovascular function, and many endocrine processes). Among the rhythms under SCN control in mammals are the circadian synthesis and secretion of the pineal hormone melatonin, which relies on a multisynaptic pathway via the sympathetic nervous system to maintain and entrain rhythmicity in this hormone. Several studies have indicated that pineal melatonin feeds back on SCN rhythmicity to modulate circadian patterns of activity and other

processes. However, the nature and system-level significance of this feedback are unknown. Recently published work indicates that although pinealectomy does not affect rat circadian rhythms in light-dark cycles or constant darkness, wheel-running activity rhythms are severely disrupted in constant light. These data suggest that either pineal feedback regulates the light sensitivity of the SCN, and/or it affects coupling among circadian oscillators within the SCN or between the SCN and its output. The objective of Task Order No. 0013, amendment to USAF Contract No. F33615-89-C0603, was to quantify the metabolic activity of subjects during isometric and isotonic exercise to develop procedures for individualized exercise performance during simulated high altitude exposures. To satisfy the stated objective, KRUG Life Sciences performed the following tasks: designed and instrumented a stack-weight machine suitable for isometric or isotonic exercise performed with the arm or legs; provided and operated an advanced metabolic measurement system capable of breath-by-breath analysis of low-level oxygen consumption data; provided for administration of criterion tests for maximal oxygen consumption (VO2 max) and maximal voluntary contraction; developed procedures for equating and individualizing the isometric and isotonic work by means of oxygen consumption (% of VO2 max); and provided procedures for training subjects on the individual exercise programs. HUMAN CENTRAL NERVOUS SYSTEM OXYGEN TOXICITY DATA FROM 1945 TO 1986 Technical Report, 1986 - 1992
Andrea L. Harabin Jan. 1993 142 p
(AD-A268225; NMRI-93-03) Avail: CASI HC A07/MF A02

This report contains a summary of all known results from controlled human exposures to hyperbaric O2. The data were collected for analysis and development of predictive models relating the risk of developing a symptom of central nervous system O2 toxicity as a function of time, depth, and condition of exposure. Data were obtained from publications and technical reports and verified by original records and log books. A total of 2,170 exposures, at depths ranging from 12 feet of sea water (fsw) to 100 fsw for up to 240 min, are included. The data consist of exposure time, depth, fraction of inspired O2, temperature, whether or not subjects exercised, whether they were immersed in water or exposed in a dry chamber, and outcome of the exposure, i.e., whether a symptom developed or the exposure was completed safely. Studies conducted under the following conditions were found: dry, no exercise; dry, exercise; immersed, no exercise; and immersed, exercise. The final category was divided into old (before 1972) and new. DTIC

METHODS TO OBTAIN BLOOD SAMPLES PERIODICALLY DURING EXERCISE RESEARCH STUDIES WHILE SUBJECTS ARE IMMERSED IN WATER OR OTHERWISE INACCESSIBLE Technical Report, 1990 - 1992
J. W. Thorp, J. R. Roberts, and T. J. Doubt Jan. 1993 14 p
(AD-A268227; NMRI-93-02) Avail: CASI HC A03/MF A01

We describe a method to obtain periodic blood samples during exercise studies by use of an indwelling intravenous catheter. A step-by-step process for establishing the intravenous line and obtaining samples is also described. Steps we have found especially useful to facilitate the process and to avoid complications are presented in more detail. A list of supplies required for the process is included. With these methods, we have been able to obtain samples from subjects performing heavy exercise on cycle ergometers and from other subjects who were immersed for up to three hours in water at 18 deg C and working on an underwater ergometer. Hemorrhage, infection, or other complications did not occur. The only failure has been occasional inability to obtain a blood sample because blood flow was inadequate. DTIC

CURRENTS INDUCED IN THE HUMAN BODY FOR EXPOSURE TO ULTRAWIDEBAND ELECTROMAGNETIC PULSES Final Report, Aug. - Nov. 1992
Om P. Gandhi and Cynthia M. Furse May 1993 32 p
(Contract F33615-91-C-0600)
(AD-A268570; AL-TR-1992-0156) Avail: CASI HC A03/MF A01

We have used the recently developed frequency-dependent finite-difference time-domain ((FD)(sup 2)TD) method to calculate internal electric fields and induced current densities in a 1.31-cm resolution anatomically based model of the human body for exposure to an ultrawideband vertically polarized electromagnetic pulse (EMP). The Fourier spectrum of the pulse revealed that it had energy content to about 1500 MHz with the bulk of the energy being in the frequency band 400-800 MHz. The complex permittivities epsilon*(w) for the various tissues are known to vary a great deal over the wide bandwidth of the incident pulse. In the ((FD)(sup 2)TD) formulation, these frequency-dependent epsilon*(w) have been described by the best-fit two-relaxation Debye equations with different constants epsilon(sub infinity), epsilon(sub s1), and epsilon(sub s2) for the sixteen tissues (fat, muscle, blood, etc.) that are used in defining the anatomically based model. From the values of the induced electric displacement vector D, we have calculated the time variations of the vertical currents that pass through each of the sections of the model that is assumed to be either isolated or shoe-wearing, standing above a perfectly conducting ground plane. Peak vertical currents with magnitudes on the order of 1-4 mA per V/m of incident electric fields are calculated with the highest values calculated for the sections through the bladder and slightly above it. AN INFORMATION PROCESSING CLASSIFICATION OF BEYOND-VISUAL-RANGE AIR INTERCEPTS Final Technical Report, Jan. - Dec. 1991
Michael R. Houck, Leslie A. Whitaker, and Robert R. Kendall May 1993 53 p
(Contract F33615-90-C-0005)
(AD-A266927; AL/HR-TR-1993-0061) Avail: CASI HC A04/MF A01

This research produced a descriptive classification of the task behaviors and cognitive processing associated with performing a beyond-visual-range (BVR) air combat mission. An F-15C defensive counter air mission scenario was analyzed to identify the critical tactical decisions required of the pilot, the information that must be processed in order to make these decisions, and the overt behaviors associated with pilots' information processing. The goal of this classification scheme was to determine observable behaviors that can be used as overt indicators of cognitive information processing. For future research purposes, the classification will provide a framework for identifying observable task behaviors that may be worthy candidates for developing and testing measures of performance. Such measures are essential for assessing the effectiveness of simulator-based training programs for enhancing the cognitive skills necessary for BVR employment. DTIC

THE 12TH ANNUAL CARMEL CONFERENCE, DISTINCTIVENESS AND MEMORY: COGNITIVE PSYCHOPHYSIOLOGICAL AND PHYSIOLOGICAL CONSIDERATIONS Final Report, 10 Jan. 1992
Emanuel Donchin 10 Jun. 1993 12 p Conference held in Carmel Highland, CA, 5-10 Jan. 1992
(Contract F49620-92-J-0102)
(AD-A267181; AFOSR-93-0525TR) Avail: CASI HC A03/MF A01

A workshop concerned with the integration of data obtained by a number of recently developed imaging methods with data obtained by more traditional means was conducted in Carmel Highlands, California, January 5-10, 1992. The thirty-four attendees focused, as a context for considering the challenge of integration, on the degree to which converging information makes it possible to develop models accounting for the effects of distinctiveness on recall, with particular emphasis on models of hippocampal function. Special consideration was given to the relationship between scalp recordings of ERP's and the neuroanatomical information that can be obtained on related processes by MRI, PET, numerical estimation procedures, and the study of focal lesions. The conference paid particular attention to the need to develop a common vocabulary and novel research paradigms if we are to gain the full benefits of current technological innovations. DTIC

Rapid shifts in work schedules demand that pilots and aircrew quickly adapt to new sleep schedules. Transitions to nighttime duty hours lacking planned work/rest schedules can result in the delay of physiological and cognitive adaptation, fatigue, and performance degradation (shift lag). The objective of this study was to determine the effects of a night shift coping strategy in the adaptation of helicopter pilots (UH-1) to nighttime (2100 to 0100) flying schedules. Daily activity/rest rhythms of instructor and rated student pilots (IP's/RSP's) were monitored 24 h perday for a total of 21 to 28 days using individual wrist activity monitors. RSP's ($n = 6$) lived in dormitories with complete blocking of daylight (below 10 lux) and reduced environmental noise until 1000. Meals and academic activities were scheduled to all RSP's the opportunity to sleep until 1000 after night flights. IP's lived in private homes and were expected to meet administrative, academic, and flight instruction demands. Throughout the NVG course, RSP's elected to retire between 0040 and 0200, to rise at approximately 0900, and to delay morning daylight exposure between 0900 1000. This schedule of activities resulted in an average of 7 h of bedrest under both daytime and nighttime duty schedules. In contrast, IP's exhibited variable rise times, usually occurring between 0700 and 0830 during both daytime and nighttime duty schedules. After night flights, IP's exhibited a delay of bedtime (2 h) but failed to consistently delay rise times. DTIC

Recent evidence indicates that the early stages in visual processing may be broken into several parallel streams that are specialized for the analysis of different visual attributes. A contour localization task showed that all attributes can contribute equally to border localization no particular attribute dominated position decisions. A series of experiments on transparency perception showed that transparency is analyzed rapidly (within 60 msec) and influences early levels of visual processing. We have also investigated the early stages that lead from the initial 2D representation to object recognition. Visual priming studies have been completed which suggest that object recognition begins, not with the construction of a 3-D model, but with a crude match of 2-D views to internal prototypes. The prototype that has the best match then guides the construction of an internal 3-D model. An analysis of drawing techniques has led to ideas about memory codes for the depth structure of an image and to simplified mechanisms for understanding shadows and shading and to renewed interest in 'isophot' models of shading. Visual search studies have shown that some scene features may be rapidly suppressed. For example, shadows appear to be identified early and discounted in order to allow object contours to be processed. Finally, long-term practice in visual search tasks leads to learning of both object-centered and retinotopic properties of the stimuli. DTIC

COMPLEXITY ANALYSIS OF REAL-TIME REINFORCEMENT LEARNING APPLIED TO FINDING SHORTEST PATHS IN DETERMINISTIC DOMAINS
Sven Koenig and Reid G. Simmons Dec. 1992 102 p
(AD-A266636; CMU-CS-93-106) Avail: CASI HC A06/MF A02

This report analyzes the complexity of on-line reinforcement learning algorithms, namely asynchronous real-time versions of Q-learning and value-iteration, applied to the problems of reaching any goal state from the given start state and finding shortest paths from all states to a goal state. Previous work had concluded that, in many cases, initially uninformed (i.e. tabula rasa) reinforcement learning was exponential for such problems,

THE PAPER AND INK USED IN THE ORIGINAL PUBLICATION MAY AFFECT THE QUALITY OF THE MICROFORM EDITION.

or that it was tractable (i.e. of polynomial time-complexity) only if the learning algorithm was augmented. We prove that, to the contrary, the algorithms are tractable with only a simple change in the task representation (penalizing the agent for action executions) or initialization (initializing high). We provide tight bounds on their worst-case complexity, and show how the complexity is even smaller if the state space has certain special properties. We compare these reinforcement learning algorithms to other uninformed on-line search methods and to informed off-line search methods and investigate how initial knowledge of the topology of the state space can decrease their complexity. We also present two novel algorithms, the bi-directional Q-learning algorithms and the bi-directional value-iteration algorithm, for finding shortest paths from all states to a goal state and show that they are no more complex than their counterparts for reaching a goal state from a given start state. The worst-case analysis of the reinforcement learning algorithms is complemented by an empirical study of their average-case complexity in three domains. DTIC

COMPLEX INFORMATION COORDINATION PERFORMANCE: DIFFERENTIAL CHANGES IN WORKING MEMORY CONTRIBUTIONS FOLLOWING TRAINING Final Report
David J. Law, Kevin A. Morrin, and James W. Pellegrino 30 Jun. 1993 70 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1709; NR Proj. S11-42-CS)
(AD-A267007) Avail: CASI HC A04

Yee, Hunt, and Pellegrino introduced the concept of information coordination tasks--tasks that require the concurrent performance of two or more component tasks and the subsequent coordination of component information. In the present experiment different procedures, componential and contextual, were used to train separate groups (N = 35, N = 33) in a coordination task that involved dynamic spatial and verbal components. Within and between group analyses indicated that post-training performance improved and the improvement was equivalent across treatments. However, individual differences analyses indicated the treatments promoted different ability-performance profiles, which were related to differential dependencies on working memory resources. The differential dependence on working memory appears related to the functional consistency of information in the different treatments. Further analyses indicated that both treatments fostered the coordination of the dynamic spatial information within the relative arrival time task--a dynamic spatial coordination task. Sensitivity to relative velocity, working memory capacity, verbal processing ability, and gender mediated whether individuals became coordinators of dynamic spatial information. The broad implications of this study include the importance of combining mean and individual differences analyses in studies of human cognition. DTIC

SCUBA-DIVING, ANXIETY AND TASK PERFORMANCE
Baruch Nevo and Moshe Zeidner [1984] 18 p
Avail; CASI HC A03/MF A01

This study was primarily designed to examine the effect of scuba-diving on anxiety and cognitive performance in divers. In addition, this study experimentally tested the validity of the state-trait anxiety distinction. The sample was composed of 7 female and 6 male university students. Using a repeated measures design counterbalanced for testing conditions, subjects were administered a series of cognitive and anxiety measures both on land and when scuba-diving underwater. Whereas Trait-Anxiety scores were not significantly elevated by diving, State-Anxiety scores and heartbeat were significantly higher when diving underwater compared to surface conditions. Time estimation was significantly impacted by diving conditions, with subjects providing shorter time estimates for underwater conditions relative to control conditions. However, diving had no significant impact upon either the quantity or quality of simple math calculations. Overall, there is a tendency for diving conditions to impact upon some cognitive measures but not others. Since only state scores, but not trait scores, were affected by the experimental conditions, this study provides additional support for the construct validity of the State-Trait Anxiety Inventory in differentiating between anxiety as a state and trait. NEURAL MECHANISMS OF ATTENTION Final Technical Report, 15 Dec. 1990 - 14 Nov 1992
David S. Olton, Kevin Pang, and Howard Egeth 21 May 1993 125 p
(Grant AF-AFOSR-0110-91)
(AD-A266315; AFOSR-93-0454TR) Avail: CASI HC A06/MF A02

This project was successful in examining the neural mechanisms involved in attention. An important outcome is the conclusion that modification of neural transmission by attentional processes takes place in many different places in the nervous system and at many different levels of information processing. Animal models of attentional processes are being developed that allow more extensive analysis of the neuroplastic changes involved in attention. The field of attention is now able to proceed in an integrated fashion similar to the way that memory has been pursued. DTIC

A COMPUTER-BASED TRAINING SYSTEM COMBINING VIRTUAL REALITY AND MULTIMEDIA
S. A. Stansfield 28 Apr. 1993 8 p Presented at the 1993 Conference on Intelligent, Computer-Aided Training and Virtual Environments, Houston, TX, 5-7 May 1993
(Contract DE-AC04-76DP-00789)
(DE93-013768; SAND-93-0967C; CONF-9305194-1) Avail: CASI HC A02/MF A01

Training new users of complex machines is often an expensive and time-consuming process. This is particularly true for special purpose systems, such as those frequently encountered in DOE applications. This paper presents a computer-based training system intended as a partial solution to this problem. The system extends the basic virtual reality (VR) training paradigm by adding a multimedia component which may be accessed during interaction with the virtual environment: The 3D model used to create the virtual reality is also used as the primary navigation tool through the associated multimedia. This method exploits the natural mapping between a virtual world and the real world that it represents to provide a more intuitive way for the student to interact with all forms of information about the system. REFERENCE FRAMES IN VISION Annual Report, 15 Feb. 1992 - 14 Feb. 1993
Mary M. Hayhoe 26 May 1993 5 p
(Grant AF-AFOSR-0332-91)
(AD-A266174; AFOSR-93-0422TR) Avail: CASI HC A01/MF A01

This research examines the consequences of observer motion for visual functioning. Two major visual issues are addressed. The first issue is how a grossly time-varying retinal input (due to eye, head, and body motion) results in the perception of a continuous and directionally stable world. The second issue concerns the relatedness of the visual information that is retained from previous viewing. An examination of 'deictic primitives' (e.g., fixation points) and their importance for accurate internal representations is being investigated by covarying the temporal access to the sensory input during the problem solving process. Preliminary observations reveal some notable features of the-eye and head coordination: (1) Head movement frequently leads the gaze change, and (2) The fraction of gaze shift due to head movement varied from 20% for short, vertical movements, to nearly 100% for large horizontal movements. It was in general dependent on the sub-task, and was larger for horizontal than vertical gaze changes. In addition, it was shown that the gaze moved first to the model area, then is refined down to the workspace, while the head simply moves to the model area. DTIC

STATES OF AWARENESS 1: SUBLIMINAL PERCEPTION RELATIONSHIP TO SITUATIONAL AWARENESS Final Report, 30 Nov. 1988 - 31 May 1991
Grant E. Secrist and Bryce O. Hartman May 1993 67 p
(AF Proj. 7755)
(AD-A267249; AL-TR-1992-0085) Avail: CASI HC A04/MF A01

On the face of it, subliminal perception violates common sense. How can a stimulus for which you have no knowledge make any difference? In its simplest terms, the answer is as follows. When you have a known

stimulus at a known intensity, which is at or below the level of conscious awareness, and behavior on a concurrent or subsequent task is modified, then you have a subliminal perception. This report reviews and integrates the literature on subliminal perception. We review the history (early research was weak) and theoretical roots. Then we examine in detail the five prominent methodologies: signal detection; dual channel; masking; lexical decision; and neurophysiologic--the latter very briefly. The main part of the review addresses two major areas: Subthreshold information acquisition; and subconscious information processing. Current criticisms are examined. Operational relevance is discussed. The significance of subliminal perception for operational applications is that it provides a methodological basis for one kind of training to enhance situational awareness. DTIC

LOCALIZING VISUAL FUNCTION IN THE BRAIN Final Report, 1 Jun. 1992 - 31 Jan. 1993
William H. Merigan 13 Aug. 1992 16 p
(Contract F49620-92-J-0369)
(AD-A267381; AFOSR-93-0527TR) Avail: CASI HC A03/MF A01

The subject of 'Localizing Visual Function in the Brain' was discussed at a three-day meeting in Rochester. The meeting consisted of presentations by 15 prominent scientists of topics including the following: the anatomy of modular connections in the primate visual system; computational advantages of modular organization; imaging of the function of visual cortex; and physiological and behavioral evidence of modular processing. Each group of presentations was followed by a wide ranging discussion of the theme of the session. An audience of about 200 researchers and students included visual and computational scientists, neurologists, and radiologists, as well as a diverse group of investigators (largely physicists and engineers) interested in brain imaging. Many participants felt that it was an unusually productive meeting because of the broad range of related issues covered and the, at times intense, discussions that filled the meeting. DTIC

THEORETICAL AND EXPERIMENTAL RESEARCH INTO BIOLOGICAL MECHANISMS UNDERLYING LEARNING AND MEMORY
30 Jun. 1993 34 p
(Contract N00014-91-J-1316)
(AD-A267441) Avail: CASI HC A03/MF A01

This is written to provide a semi-annual progress report for the contract N00014-91-J-1316 entitled 'Theoretical and Experimental Research into Biological Mechanisms Underlying Learning and Memory.' The major goal of our research is to elucidate the biological mechanisms that underlie learning and memory: to find principles of organization that can account both for experimental data on the cellular level and, when applied to large numbers of neurons that receive sensory and/or interneuronal information, for various higher level system properties. Among our detailed objectives are the following: to clarify the dependence of learning on synaptic modification; to elucidate the principles that govern synapse formation or modification; and to use principles of organization that can account for observations on a cellular level to construct neural-like systems that can learn, associate, and reproduce such higher level cognitive acts as abstraction and computation. ACQUISITION AND PRODUCTION OF SKILLED BEHAVIOR IN DYNAMIC DECISION-MAKING TASKS Final Report
Alex Kirlik 12 Nov. 1993 30 p
(Grant NAG2-656)
(NASA-CR-194658; NAS 1.26:194658) Avail: CASI HC A03/MF A01

Summaries of the four projects completed during the performance of this research are included. The four projects described are: Perceptual Augmentation Aiding for Situation Assessment, Perceptual Augmentation Aiding for Dynamic Decision-Making and Control, Action Advisory Aiding for Dynamic Decision-Making and Control, and Display Design to Support Time-Constrained Route Optimization. Papers based on each of these projects are currently in preparation. The theoretical framework upon which the first three projects are based, Ecological Task Analysis, was also developed during the performance of this research, and is described in a previous report. A project concerned with modeling strategies in human control of a dynamic system was also completed during the performance of this research. Author (revised)

THE EFFECTS OF LUMINANCE BOUNDARIES ON COLOR PERCEPTION Final Report, 15 Mar. 1989 - 14 Jan. 1993
Richard E. Kronauer, Charles F. Stromeyer, III, and Alex Chaparro 20 Jul. 1993 39 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0304-89)
(AD-A268398) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The luminance and red-green chromatic detection mechanisms respond to, respectively, the sum and difference of the long-wave (L) and middle-wave (M) cone contrast signals. The most-detectable stimulus is not a small patch of luminance drifting grating, as suggested by others, but rather a small, foveal red-green chromatic flash. Even at the smallest test size examined, 2.3 ft. diameter, the red-green mechanism is more sensitive than the luminance mechanism, which has profound implication for visual physiology. When a suprathreshold luminance flash (a pedestal) occurs coincidentally with a red-green chromatic flash, detection of color is facilitated approximately 2-fold, regardless of spot size, as shown by forced-choice results, and this constant facilitation contrasts with the much larger facilitation reported earlier for small flashes. The lack of chromatic masking by suprathreshold luminance pedestals supports the view of separable luminance and red-green detectors. DTIC

SYNAPTIC PLASTICITY AND MEMORY FORMATION Annual Technical Report, 1 Jun. 1992 - 31 May 1993
Gary Lynch 30 Jun. 1993 5 p
(Contract F49620-92-J-0307)
(AD-A267988; AFOSR-93-0565TR) Avail: CASI HC A01/MF A01

The physiological effect known as long-term potentiation (LTP) is widely suspected of being the substrate of several forms of memory encoded by synapses in the forebrain of humans and other mammals. Work in the past year established that translational suppression with antisense oligonucleotides of one of the subunits of the AMPA (glutamate) transmitter receptor blocks the capacity of synapses to exhibit LTP. This confirms the hypothesis that the AMPA receptor is the agent of LTP expression. Changes in the waveform of the synaptic responses were found to occur in conjunction with LTP and were suggestive of a shift in the kinetic properties of the AMPA receptor channel. Computer simulations of the receptor led to the discovery that all known phenomenology of LTP expression can be reproduced by simply increasing the rates at which the receptor channel opens and closes. In parallel studies, a drug which acts on the AMPA receptor channel was shown to facilitate the induction of LTP. This led to a drug development program to find potent compounds of this kind which cross the blood-brain barrier and enhance the AMPA receptor and LTP in behaving rats. This effort was successful and one of the new drugs was then tested extensively in large numbers of rats across three learning tasks; as predicted, this compound produced substantial improvements in the encoding of short and long-term memories. PROCESSES INVOLVED IN THE INTEGRATION OF PICTURES AND DISCOURSE Annual Report, 1 Jun. 1992 - 31 May 1993
Arthur Glenberg 7 Jul. 1993 2 p
(Contract F49620-92-J-0310)
(AD-A268150; AFOSR-93-0615TR) Avail: CASI HC A01/MF A01

During the period 7/92 to 6/93 Peter Kruley conducted experiments studying the comprehension of illustrated texts; he took a leading role in designing the experiments, writing and debugging computer programs used in the collection of data, collecting actual subject data, and analyzing the data. In two experiments conducted from June to Nov. 1992, subjects read scientific texts, either with or without illustrations, while simultaneously performing tasks that stressed working memory. The goal of the experiments was to investigate the contribution of spatial and non-spatial working memory to the comprehension of texts; the results showed that performance of a concurrent spatial task was impaired when subjects read illustrated texts, whereas performance of a non-spatial task was not so impaired. Thus evidence was found for on-line use of the visuo-spatial sketchpad during comprehension of illustrated texts. DTIC

A VIRTUAL ACOUSTIC ORIENTATION INSTRUMENT Final Report, Nov. 1991 - 1992
Don C. Teas Jan. 1993 44 p
(Contract F33615-89-C-0603)
(AD-A268181; AL-TR-1992-0157) Avail: CASI HC A03/MF A01

Virtual instrumentation developed to create acoustic stimuli for use as orientation signals and the rationale for selecting these target signals is described. A commercially available computer-assisted software engineered programming system, LabVIEW, was used to develop the acoustic signals and the manner of their presentation. Two different acoustic signals are presented. One sound seems to change pitch without limit, and the other is a narrow band-pass noise. The pitch, loudness, and lateral position of the signals are controlled by different functions. Listeners can control the variations in pitch and lateralization and also the rate at which these features change. Programs to generate the signals with sinusoids or with noise bands are described. LabVIEW representations of the programs are included with text descriptions. DTIC

PERCEPTION OF LIGHTNESS AND BRIGHTNESS IN COMPLEX PATTERNS Final Report, 1 May 1991 - 30 Apr. 1993
Lawrence E. Arend, Jr. 30 Jun. 1993 24 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0377-89)
(AD-A268435; AFOSR-93-0617TR) Avail: CASI HC A03

Perception of surface color plays an important part in many everyday visual tasks. Psychophysical and neurophysiological data on early visual processes suggest a number of potential sensory limitations on the accuracy of surface-color perception. A new paradigm has been used to clarify the relationships between early visual processes and perception of achromatic surface colors (shades of gray). Psychophysical measurements of perceived surface color were made using achromatic stimulus patterns that were complex enough to support unambiguous perception of surfaces and lights. Lightness (apparent reflectance), brightness (apparent luminance) and local brightness contrasts were all measured using the same stimulus patterns. According to a number of models, lightness is closely related to local brightness contrast, but the data indicated that the relationship is more complicated than previously supposed. The brightness contrast data are well described by Stiles' threshold-vs-radiance curve, which is widely thought to be a characteristic of retinal adaptation processes. Both brightness and lightness are slightly higher on dark gray backgrounds than on white backgrounds. This perceptual error appears to be independent of illumination level. DTIC

THE BEHAVIORAL TOXICOLOGY OF HIGH-PEAK, LOW AVERAGE POWER, PULSED MICROWAVE IRRADIATION Interim Report, 20 Oct. 1989 - 31 Dec. 1992
T. G. Raslear, Y. Akyel, F. Bates, S.-T. Lu, and E. C. Elson 25 Jan. 1993 95 p
(AD-A268392) Avail: CASI HC A05/MF A01

The TEMPO microwave bioeffects exposure platform at the Department of Microwave Research, Walter Reed Army Institute of Research, produces an 80 ns, 3 GHz microwave pulse with a peak power of 700 MW. The energy transmitted is approximately 16 J, so that at a pulse repetition rate of 0.125 Hz, the duty factor is 10(exp -8) and the average power is 2 W. The time-averaged SAR for TEMPO exposures at full power is 0.072 W/kg, a value well-below suggested exposure limits. Five behavioral tasks were used to determine if exposure affected subsequent task performance: temporal bisection, Y-maze, treadmill running, food motivation (behavioral economics), and Persolt swim test. Reliable effects were found with the temporal bisection, Y-maze, treadmill, and behavioral economics tasks. The pattern of results suggests at least two effects of high-power pulsed microwaves: memory impairment and decreased physical endurance. It was suggested that research be expanded in this area, and that tasks which are specifically sensitive to memory function and physical endurance receive especial attention. DTIC

A HIGH-SPEED OBJECT RECOGNITION CHIP BASED ON A BIOLOGICALLY-REALISTIC HYBRID TEMPORAL PROCESSING Progress Report No. 2
4 Aug. 1993 78 p
(Contract N00014-93-C-0118)
(AD-A268270) Avail: CASI HC A05/MF A01

This report traces the progress made by Intelligent Reasoning System, Inc. (IRSI) on contract N00014-93-C-0118, from June 1, 1993 to July 31, 1993. The technical objective of this Phase 1 effort is to evaluate the feasibility of a binocular object recognition system for the Integrated Active VISION System (INAVISIONS) currently under development at IRSI. The INAVISIONS is based on a custom Very Large Scale Integration (VLSI) Hybrid Temporal Processing Element (HTPE) developed by IRSI (patent pending). Active vision implies that the image collection and processing operations form a single, integrated, adaptive system in which high-level processes, such as object recognition can augment lower level processes through feedback connections and can itself be controlled by higher levels. For example, the object recognition process can instruct the oscillating saccadic perception system to enhance the image resolution by a particular amount to assist in the object recognition process. Higher level perception systems can guide the object recognition processes by using expectations of what objects might be present in the image. Therefore, the INAVISIONS behaves a single image collection and processing system with coupled low- and high-level capabilities. DTIC

INVESTIGATION OF THE EFFECTS OF EXTRAVEHICULAR ACTIVITY (EVA) GLOVES ON PERFORMANCE

Ram R. Bishu (Nebraska Univ., Lincoln.) and Glenn Klute Oct. 1993 49 p

(NASA-TP-3401; S-732; NAS 1.60:3401) Avail: CASI HC A03/MF A01

The objective was to assess the effects of extravehicular activity (EVA) gloves at different pressures on human hand capabilities. A factorial experiment was performed in which three types of EVA gloves were tested at five pressure differentials. The independent variables tested in this experiment were gender, glove type, pressure differential, and glove make. Six subjects participated in an experiment where a number of dexterity measures, namely time to tie a rope, and the time to assemble a nut and bolt were recorded. Tactility was measured through a two point discrimination test. The results indicate that with EVA gloves strength is reduced by nearly 50 percent, there is a considerable reduction in dexterity, performance decrements increase with increasing pressure differential, and some interesting gender glove interactions were observed, some of which may have been due to the extent (or lack of) fit of the glove to the hand. The implications for the designer are discussed. Author (revised)

COMPARATIVE NIGHT VISION GOGGLE VISUAL ACUITY MEASUREMENTS PERFORMED IN THE A-10 AIRCRAFT IN AN OPERATIONAL SETTING Final Report, Apr. - Sep. 1992

Carita A. Devilbiss and Joseph C. Antonio Apr. 1993 29 p

(Contract F33615-90-C-0005)

(AD-A266721; AL/HR-TR-1993-0066) Avail: CASI HC A03/MF A01

The Night Vision Programs Office of the Aircrew Training Research Division, Armstrong Laboratory, responded to a request from the 422nd Operational Test Squadron at Nellis AFB to conduct the ground testing portion of their A-10 Night Vision Goggle (NVG) special project. Evaluations were conducted comparing the performance of four different NVG's under both laboratory and representative operational conditions. The performance of the F4949 'Super ANVIS' was superior to that of the other NVG's tested. Additionally, a comparative study was conducted evaluating the impact of two different windscreens on NVG image quality. The new windscreen allowed the transmission of more energy usable to the NVG's, thus enhancing image quality over that possible with the old windscreen. DTIC

INFLATABLE RESCUE DEVICE Patent Application

Scott A. Swan, inventor (to NASA) 4 May 1993 21 p

(NASA-Case-MSC-22244-1; NAS 1.71:MSC-22244-1;

US-Patent-Appl-SN-066274) Avail: CASI HC A03/MF A01

This invention discloses, in one aspect, a personal rescue device for use in outer space which has an inflatable flexible tube with a shaper apparatus herein. Gas under pressure flows through the shaper apparatus and into the flexible tube. The flexible tube is mounted to the shaper so that as it inflates it expands and deploys lengthwise away from the shaper. In one embodiment a housing contains the shaper and the flexible tube and the housing is designed to facilitate movement of the expanding tube from the housing so the expanding tube does not bunch up in the housing. QUESTIONING MECHANISMS DURING TUTORING, CONVERSATION, AND HUMAN-COMPUTER INTERACTION Final Report, 15 Jun. 1992 - 14 Jun. 1993

Arthur C. Graesser Jun. 1993 51 p

(Contract N00014-92-J-1826)

(AD-A266199; ONR-TR-93-1) Avail: CASI HC A04/MF A01

One-to-one tutoring is more effective than alternative training methods, yet there have been few attempts to examine the process of naturalistic tutoring. This project explored dialogue patterns in two corpora: graduate students tutoring undergraduates in research methods; and high school students tutoring 7th graders in algebra. We analyzed pedagogical strategies, feedback mechanisms, question asking, question answering, and pragmatic assumptions during the tutoring process. One pervasive dialogue pattern

was a five-step frame: (1) tutor asks question, (2) student answers question, (3) tutor gives short feedback on answer quality, (4) tutor and student collaboratively improve on answer quality, and (5) tutor assesses the student's understanding of the answer. Tutor questions were primarily motivated by curriculum scripts and the process of coaching students through exemplar problems--rarely by attempts to diagnose and remediate the student's idiosyncratic knowledge deficits. Dialogue patterns were simulated by two computational models: a recurrent connectionist network, and a recursive transition network. These models capture the systematicity in the sequential ordering of speech act categories. That is, to what extent does a model accurately predict the category of speech act N+1, given speech acts 1 through N? DTIC

EVALUATION OF NIGHT VISION GOGGLES (NVG) FOR MARITIME SEARCH AND RESCUE (HH-3/HH-60) COMPARISON REPORT Final Report, Mar. 1989 - Jan. 1993
R. Q. Robe and J. V. Plourde Jan. 1993 97 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DTCG39-89-C-E10G56)
(AD-A266493; USCG-D-09-93) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Eight experiments, including seven involving helicopters, have been conducted by the U.S. Coast Guard Research and Development (R and D) Center to evaluate night vision goggles (NVG's) for their effectiveness in detecting small targets at night. Three types of NVG's have been evaluated. The AN/AVS-6 Aviator's Night Vision Imaging System (ANVIS) was evaluated onboard U.S. Coast Guard HH-3F, CH-3E, and HH-60J helicopters and HU-25C and RG-8A fixed-wing aircraft. The AN/PVS-5C and AN/PVS-7A NVG's were evaluated onboard U.S. and Canadian Coast Guard Search and Rescue Units (SRU's) in the 200-foot size range and onboard U.S. Coast Guard 41-foot utility boats (UTB's). A total of 3029 target detection opportunities were generated during searches from helicopters for all the target types employed during the eight experiments. These data were first analyzed to determine whether a statistically significant difference existed in the detection performance of the HH-3/CH-3 and HH-60 helicopters. The data were then analyzed to determine which of 25 search parameters of interest exerted a statistically significant influence on target detection probability. Lateral range curves and sweep width estimates are presented for SRU/target type combinations that contained sufficient data to support this detailed analysis. Human factors data are presented and discussed. DTIC

REGULATED EMERGENCY OXYGEN SYSTEM Final Report, Jan. 1990 - Jan. 1991
Nancy J. Balkus, Edward W. Hade, and John H. Ohlhausen Jun. 1993 31 p
(Contract F33615-89-C-0603)
(AD-A266228; AL-TP-1992-0041) Avail: CASI HC A03/MF A01

This paper describes the accomplishments of the Regulated Emergency, Oxygen System (REOS) task. A true emergency secondary oxygen system is nonexistent in current aircraft. The current system is inadequate in regulating pressure, is ineffective at altitudes below 10,000 ft, and provides no option except to activate the emergency oxygen bottle if a malfunction of the primary regulator occurs. The REOS concept alleviates these inadequacies by providing an option to select a secondary regulated oxygen source, rather than the emergency bottle, if there is a malfunction of the primary regulator. Also of significance is that altitude protection has been incorporated into the REOS. The contents of this paper provide greater details as to the background, development, and testing of the REOS. PRELIMINARY VALIDATION OF THE TASK ANALYSIS/WORKLOAD METHODOLOGY Interim Report, Jul. 1990 - Dec. 1991
David B. Hamilton and Kenneth D. Cross Jun. 1993 147 p
(AD-A267514; AS1690-353-92; ARI-93-18) Avail: CASI HC A07/MF A02

Over the past 8 years, the U.S. Army Research Institute for the Behavioral and Social Sciences (ARI) has sponsored the development of the Task Analysis/Workload (TAWL) methodology. The methodology is used to develop computer-based models that predict the operator workload of Army weapon systems. The TAWL methodology has been used to predict operator workload in existing and modified versions of the AH-64, UH-60, and CH-47 aircraft. This preliminary research was designed to assess the validity of the methodology. Seven experimental task conditions, analogous to rotorcraft operation and designed to vary in workload, were used in the research. Two TAWL workload prediction models of the conditions were independently developed by two analysts. Twenty AH-64A aviators performed repeated trials in each of the task conditions. Measures of the aviators' task performance, subjective workload, and physiological workload were obtained as TAWL model validity criteria. Although there were some differences between the models developed by the two analysts, the predictions generated by the models were highly correlated. In addition, the correlations between the average TAWL predictions for both models and the criterion measures were significant and high (between .89 and .99). The results support the validity of the TAWL methodology. DTIC

STRATEGY FOR THE REDUCTION OF TOTAL INTEGRATED FLUID LOGISTICS TO THE SPACE STATION FREEDOM
Marston J. Gould and David T. Shannon, Jr. Nov. 1993 66 p
(RTOP 476-14-06)
(NASA-TM-107744; NAS 1.15:107744) Avail: CASI HC A04/MF A01

The use of an integrated environmental control and life support system (ECLSS) and secondary propulsion system (SRS) on the Space Station Freedom (SSF) has many potential advantages. Through the metabolism of food, the crew on-board the station will produce carbon dioxide as a waste gas and an excess of water in the form of urine and condensate. The processing of these waste fluids by the ECLSS could produce quantities of oxygen that would eliminate the need for cryogenic oxygen resupply and hydrogen, carbon dioxide, and/or methane that could be used with the addition of a resistojet system to provide a constant low thrust for station. This additional thrust would represent significant savings in required hydrazine resupply. Author

The purpose of this study was to assess the utility of the Performance Decrement Questionnaire (PDO) technique for prediction of radiation induced performance decrements in Army personnel. Twenty AH-1 pilots participated in an experiment in which they (1) predicted the effects of various symptom complexes on their performance, (2) went through a 36-hour protocol to induce symptoms similar to those that are followed by intermediate doses of radiation exposure, and (3) performed a simulated AH-1 mission before and after symptom induction. The participants' performance time predictions were compared to actual performance times. The comparisons between predicted and actual performance were conducted with correlational and modeling (MicroSAINT) techniques. The modeling analysis suggested greater concordance between predicted and actual performance than did the correlational analysis. DTIC

FORCE-ENDURANCE CAPABILITIES OF EXTRAVEHICULAR ACTIVITY (EVA) GLOVES AT DIFFERENT PRESSURE LEVELS
Ram R. Bishu (Nebraska Wesleyan Univ., Lincoln.) and Glenn K. Klute 1 Dec. 1993 13 p
(NASA-TP-3420; S-746; NAS 1.60:3420) Avail: CASI HC A03/MF A01

The human hand is a very useful multipurpose tool in all environments. However, performance capabilities are compromised considerably when gloves are donned. This is especially true to extravehicular activity (EVA) gloves. The primary intent was to answer the question of how long a person can perform tasks requiring certain levels of exertion. The objective was to develop grip force-endurance relations. Six subjects participated in a factorial experiment involving three hand conditions, three pressure differentials, and four levels of force exertion. The results indicate that, while the force that could be exerted depended on the glove, pressure differential, and the level of exertion, the endurance time at any exertion level depended just on the level of exertion expressed as a percentage of maximum exertion possible at that condition. The impact of these findings for practitioners as well as theoreticians is discussed. Author

RELAXING CONSISTENCY IN RECOVERABLE DISTRIBUTED SHARED MEMORY
Bob Janssens and W. K. Fuchs 1993 9 p
(Contract N00014-91-J-1283)
(AD-A266931) Avail: CASI HC A02/MF A01

Relaxed memory consistency models tolerate increased memory access latency in both hardware and software distributed shared memory systems. In recoverable systems, relaxing consistency has the added benefit of reducing the number of checkpoints needed to avoid rollback propagation. New checkpointing algorithms that take advantage of relaxed consistency to reduce the performance overhead of checkpointing are introduced. A scheme based on lazy relaxed consistency, that reduces both checkpointing overhead and the overhead of avoiding error propagation in systems with error latency is also introduced. Multiprocessor address traces are used to evaluate the relaxed consistency approach to checkpointing with distributed shared memory. DTIC

FAST INTERRUPT PRIORITY MANAGEMENT IN OPERATING SYSTEM KERNELS
Daniel Stodolsky, J. B. Chen, and Brian N. Bershad May 1993 8 p
(Contract MDA972-90-C-0035; ARPA Order 7330)
(AD-A266638; CMU-CS-93-152) Avail: CASI HC A02/MF A01

This paper describes a new technique, optimistic interrupt protection, that efficiently schedules and handles processor interrupts. While modern processor architectures have led to substantial overall performance improvements, operating systems have received significantly less benefit than application codes. One processor function that has not scaled well with processor speed is interrupt management. Operating systems use interrupts to control scheduling and input/output and use interrupt masking to guarantee integrity of system resources shared across interrupt levels. This approach was efficient in many previous processor architectures (e.g, VAX) where the cost changing interrupt levels was small--generally less than ten instructions 4,5. In modern architectures, however, interrupt masking may be up to an order of magnitude more expensive, contributing to poorer performance of system code. DTIC

COGNITIVE ENGINEERING MODELS IN SPACE SYSTEMS Final Report
Christine M. Mitchell Aug. 1993 52 p
(Grant NAG9-422)
(NASA-CR-193473; NAS 1.26:193473) Avail: CASI HC A04/MF A01

NASA space systems, including mission operations on the ground and in space, are complex, dynamic, predominantly automated systems in which the human operator is a supervisory controller. Models of cognitive functions in complex systems are needed to describe human performance and form the theoretical basis of operator workstation design, including displays, controls, and decision aids. Currently, there several candidate modeling methodologies. They include the Rasmussen abstraction/aggregation hierarchy and decision ladder, the goal-means network, the problem behavior graph, and the operator function model. The research conducted under the sponsorship of this grant focuses on the extension of the theoretical structure of the operator function model and its application to NASA Johnson mission operations and space station applications. The initial portion of this research consists of two parts. The first is a series of technical exchanges between NASA Johnson and Georgia Tech researchers. The purpose is to identify candidate applications for the current operator function model; prospects include mission operations and the Data Management System Testbed. The second portion will address extensions of the operator function model to tailor it to the specific needs of Johnson applications. At this point, we have accomplished two things. During a series of conversations with JSC researchers, we have defined the technical goal of the research supported by this grant to be the structural definition of the operator function model and its computer implementation, OFMspert. Both the OFM and OFMspert have matured to the point that they require infrastructure to facilitate use by researchers not involved in the evolution of the tools. The second accomplishment this year was the identification of the Payload Deployment and Retrieval System (PDRS) as a candidate system for the case study. In conjunction with government and contractor personnel in the Human-Computer Interaction Lab, the PDRS was identified as the most accessible system for the demonstration. Pursuant to this a PDRS simulation was obtained from the HCIL and an initial knowledge engineering effort was conducted to understand the operator's tasks in the PDRS application. The preliminary results of the knowledge engineering effort and an initial formulation of an operator function model (OFM) are contained in the appendices. Derived from text

The advantage of optical computing is its parallelism. In the case of photography, every part of an object is focused by a camera lens onto a film to construct an image of the object. This image forming process constitutes the basis of optical parallel processing and optical computing is a technology that transforms the concept of optical processing into various information processing techniques. Various research has been conducted in the field of optical information processing to develop retrievable optical memories using the lens as the means to perform Fourier transformations or the holograms, but none of the methods has been put into practical use. They utilize the devices in classical optics such as the lenses to perform basically different functions from electronic devices. DTIC

EFFICIENT SCHEDULING OF REAL-TIME COMPUTE-INTENSIVE PERIODIC GRAPHS ON LARGE GRAIN DATA FLOW MULTIPROCESSOR M.S. Thesis
Cem Akin Mar. 1993 171 p
(AD-A267444) Avail: CASI HC A08/MF A02

Architectures of computer systems based on Data Flow (DF) concepts attracted great attention as an alternative to conventional sequential architectures (Von Neumann). DF architectures are capable of efficiently exploiting a massive amount of parallelism inherent in many types of computation. They are programmed using directed graphs whose vertices are function modules and whose edges denote data dependencies between function modules. An important subclass of DF is Large Grain Data Flow (LGDF) which is efficiently used in computation intensive applications, such as signal processing. Presently, most leadoffs incorporate a nondeterministic run-time technique to allocate system resources to support the execution (One such technique could be First Come First Served). Despite of the usual simplistic nature of scheduling techniques, which results in a low run-time overhead, the system throughput and predictability could rapidly degrade under high system load. To provide uniform output and improve the resource usage even under a high load, a compile-time technique called Revolving Cylinder (RC) was introduced. In this thesis, we present a LGDF simulator and a Graph restructurer that restructures the given graph according to the RC technique. We then perform a comparative experimental study of the different implementation of RC and the FCFS scheduling techniques. Our results demonstrate that there is a high potential for the RC technique, if a satisfactory node mapping technique is developed. DTIC

EXPERIENCE WITH DISCONNECTED OPERATION IN A MOBILE COMPUTING ENVIRONMENT
M. Satyanarayanan, James J. Kistler, Lily B. Mummert, Maria R. Ebling, and Puneet Kumar Jun. 1993 20 p
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A267524; CMU-CS-93-168) Avail: CASI HC A03/MF A01

In this paper we present qualitative and quantitative data on file access in a mobile computing environment. This information is based on actual usage experience with the Coda File System over a period of about two years. Our experience confirms the viability and effectiveness of disconnected operation. It also exposes certain deficiencies of the current implementation of Coda, and identifies new functionality that would enhance its usefulness for mobile computing. The paper concludes with a description of what we are doing to address these issues DTIC

(Contract F49620-92-J-0400)
(AD-A267908; AFOSR-93-0594TR) Avail: CASI HC A03/MF A01

In this report we describe optical disks that store data holographically in three dimensions using either angle multiplexing or wavelength multiplexing. Data is stored and retrieved in parallel blocks or pages. Each page consists of approximately one million bits. The storage capacity of such disks is derived as a function of disk thickness, pixel size, page size, and scanning parameters. The optimum storage density is approximately 120 bits/sq micron. DTIC

N94-14915# Carnegie-Mellon Univ., Pittsburgh, PA. School of Computer Science.
CONCURRENT GARBAGE COLLECTION OF PERSISTENT HEAPS
Scott Nettles, James OToole (Massachusetts Inst. of Tech., Cambridge.), and David Gifford Apr. 1993 25 p
(Contracts F33615-90-C-1465; F19628-91-C-0168)
(AD-A266831; CMU-CS-93-137; MIT-LCS-TR-569) Avail: CASI HC A03/MF A01

The first concurrent compacting garbage collector for a persistent heap is described. Client threads read and write the heap in primary memory, and can independently commit or abort their write operations. When write operations are committed they are preserved in stable storage and thus survive system failures. Clients can freely access the heap during a garbage collection because a replica of the heap is created by the stable replica collector. A log is maintained to capture client write operations. This log is used to support both the transaction system and the replication-based garbage collection algorithm. Experimental data from our implementation was obtained from a transactional version of the SML/NJ compiler and modified versions of the TPC-B and 001 database benchmarks. The pause time latency results show that the prototype implementation

provides significantly better latencies than stop-and-copy collection. For small transactions, throughput is limited by the logging bandwidth of the underlying log manager. The results provide strong evidence that the replication copying algorithm imposes less overhead on transaction commit operations than other algorithms. DTIC

ARMY SOFTWARE TEST AND EVALUATION PANEL (STEP) SOFTWARE METRICS INITIATIVES REPORT

Henry P. Betz and Patrick J. ONeill Apr. 1993 98 p

(AD-A266889) Avail: CASI HC A05/MF A02

This report documents the efforts and portrays the findings and recommendations of the Army Software Test and Evaluation Panel (STEP) Subgroup on measures. The final recommendations include the mandatory use of a minimum, common set of software metrics in order to better measure and manage software development from the test and evaluation perspective. This set of measures should be used to help determine whether the system under consideration has demonstrated the necessary functionality, maturity, and readiness to proceed to the next stage of development or testing. This set of metrics is a minimum set; other metrics of specific interest to a certain agency or point of view can and should be collected if desired. Of course, there are many characteristics of the software that need to be evaluated for quality and conformance but do not lend themselves to measurement. These quality factors remain important to any evaluation of software. Metrics are simply one element of a set of tools that should be used in a software evaluation. DTIC

VDM SPECIFICATION OF THE MD4 MESSAGE DIGEST ALGORITHM

A. Harry Aug. 1992 50 p Sponsored by Dept. of Trade and Industry, London, England

(NPL-DITC-204/92; ETN-93-94539) Copyright Avail: Issuing Activity (National Physical Laboratory, Teddington, Middlesex TW11 0LW, United Kingdom)

The use of a formal description language in the specification of an algorithm related to secure transmission of messages is illustrated. The example presented is the MD4 (Message Digest) algorithm, written in the formal notation VDM (Vienna Development Method). It is shown by example how expression in a formal language can expose possible ambiguities in natural language. It highlights the suitability of formal methods for describing security standards in a clear, concise way allowing easy implementation in any of the many different programming styles. ESA

A CENTAUR TUTORIAL

Ian Jacobs (Institut National de Recherche d'Informatique et d'Automatique, Le Chesnay, France.) and Laurence Rideau-Gallot 16 Jul. 1992 108 p

(INRIA-RT-140; ETN-93-94427) Avail: CASI HC A06/MF A02

The CENTAUR system is presented through a tutorial describing the creation of an environment for a small language of mathematical expressions called EXP. With CENTAUR, the user may interactively generate programming language environments, including structured editors, debuggers, interpreters, and other tools. In this tutorial, all phases of language specification are covered: the design of the abstract and concrete syntax of EXP in METAL and SDF, the pretty printing rules in PPML, and the semantics of an EXP intepreter in TYPOL. The tools generated by CENTAUR based on these specifications are enhanced by a user interface built with CENTAUR graphic primitives. ESA

THE VALUE OF REFERENCE IMPLEMENTATIONS AND PROTOTYPING IN A FORMAL DESIGN AND TESTING METHODOLOGY

Andrew Harry Oct. 1992 18 p Sponsored by Dept. of Trade and Industry, London, England

(NPL-DITC-208/92; ETN-93-94543) Copyright Avail: Issuing Activity (National Physical Lab., Teddington, Middlesex TW11 OLW, England)

The application of prototypes and reference implementations to a formal methodology for the writing and testing of formal specifications is reported. Exploratory prototyping is seen as being of value in the conversion of natural language standards into formally specified ones. However, the value of this may diminish as formal methods become established and algorithms are written directly from a formal notation. The use of reference implementations in the testing of security standards may become of increasing value. Greater tool support is also required, particularly in the area of verified compilers if the use of reference implementations for testing is to form part of a certifiable evaluation process. Ways of testing for security weaknesses also have to be defined. ESA

N94-15012 National Physical Lab., Teddington (England). Div. of Information Technology and Computing.

THE APPLICATION OF PROGRAMMING LANGUAGES TO THE PRODUCTION OF REFERENCE IMPLEMENTATIONS

Andrew Harry Oct. 1992 20 p Sponsored by Dept. of Trade and Industry, London, England

(NPL-DITC-209/92; ETN-93-94544) Copyright Avail: Issuing Activity (National Physical Lab., Teddington, Middlesex TW11 OLW, England)

The suitability of imperative, functional and logic based implementation languages for the production of reference implementations from formally defined specifications is examined. Reference implementations are prototype implementations of a formally defined specification which rigorously conforms to the formal definition, the resultant system being used for testing purposes. It is concluded that functional languages are the most suitable. Their use for both constructive and behavioral specification is discussed. ESA

N94-15014 National Physical Lab., Teddington (England). Data Security Group.

STANDARDS AND CONFORMANCE TESTING IN DATA SECURITY: RESULTS OF INITIAL PROGRAMME OF INVESTIGATION

Mar. 1993 47 p Sponsored by Dept. of Trade and Industry, London, England

(NPL-DITC-218/92; ETN-93-94547) Copyright Avail: Issuing Activity (National Physical Lab., Teddington, Middlesex TW11 OLW, England)

Results of a program of research concerned with the testing of implementations of data security standards are presented. These standards range from simple mechanisms for message authentication to those that form part of a large open system. The types of standard, how they can be improved by the use of formal specification languages, and how the corresponding implementations may be tested, are explored. An analysis of areas where further action is needed is given in the conclusion. ESA

N94-15022 National Physical Lab., Teddington (England). Div. of Information Technology and Computing.

TESTABILITY OF DATA SECURITY STANDARDS

Roger Manning, Bronia Szczygiel, and Andrew Harry Feb. 1993 27 p Sponsored by Dept. of Trade and Industry, London, England

(NPL-DITC-217/93; ETN-93-94605) Copyright Avail: Issuing Activity (National Physical Lab., Teddington, Middlesex TW11 OLW, England)

The requirements of security evaluation are examined. Areas that must be addressed in defining and testing implementations of standards, including such problems as inadequate specification of security, programming language and compiler insecurities, and difficulties in testing embedded systems are investigated. For each of these issues solutions and/or areas of research likely to address these problems are suggested. ESA

EVALUATION OF ALSYS 037 ADA COMPILER Final Report, Jun. - Aug. 1992

Richard M. Plishka and Agustin Ifarraguerri May 1993 16 p

(Contract DAAL03-91-C-0034)

(AD-A266972; ERDEC-CR-040) Avail: CASI HC A03/MF A01

Several standard benchmarks were implemented in order to study the real-time performance of the Alsys.037 Ada Compiler for the Inmos T800 Transputer. A limited comparison to the Transputer's native language, Occam, was possible. The key aspects that were investigated were the computational speed, using the Whetstone benchmark, the clock resolution, delay resolution, procedure call overhead and general performance. These were measured using the Performance Issues Working Group (PWIG) test suite. The Whetstone benchmark was implemented on the T800 in both Ada and Occam, making this measurement the most informative. DTIC

SOFTWARE RELIABILITY THROUGH FAULT-AVOIDANCE AND FAULT-TOLERANCE Progress Report, 1 Mar. 1992 - 1 Sep. 1993

Mladen A. Vouk and David F. McAllister 1993 61 p

(Grant NAG1-983)

(NASA-CR-194353; NAS 1.26:194353) Avail: CASI HC A04/MF A01

Strategies and tools for the testing, risk assessment and risk control of dependable software-based systems were developed. Part of this project consists of studies to enable the transfer of technology to industry, for example the risk management techniques for safety-concious systems. Theoretical investigations of Boolean and Relational Operator (BRO) testing strategy were conducted for condition-based testing. The Basic Graph Generation and Analysis tool (BGG) was extended to fully incorporate several variants of the BRO metric. Single- and multi-phase risk, coverage and time-based models are being developed to provide additional theoretical and empirical basis for estimation of the reliability and availability of large, highly dependable software. A model for software process and risk management was developed. The use of cause-effect graphing for software specification and validation was investigated. Lastly, advanced software fault-tolerance models were studied to provide alternatives and improvements in situations where simple software fault-tolerance strategies break down. CASI

SIMS: SINGLE INTERFACE TO MULTIPLE SYSTEMS Final Report, 1 Sep. 1987 - 31 Aug. 1992

Yigal Arens 31 Aug. 1992 24 p

(Contract MDA903-87-C-0641; DARPA Order 6096)

(AD-A266934) Avail: CASI HC A03/MF A01

The Services and Information Management for Decision Systems (SIMS) project integrates several computer services into a single, seamless system, as seen from the user's perspective. This relieves the user of the need to be familiar with all the services available from the system, enabling the user to make requests as though he or she were dealing with a single entity. SIMS analyzes the user request, plans the necessary sequence of calls on the services and executes them. Until now, the only approach to the problem of software integration has been to build custom systems that support an integrated view of the underlying servers. Such systems are expensive, are suitable only for the application for which they were crafted, are not very flexible with respect to functionality, and are difficult to modify. In contrast, SIMS would allow maintainers to assimilate servers into the system through a much less painful process of building a declarative model of the servers, and allowing the SIMS planner to perform the actual integration task. A BROWSING TOOL FOR THE INTERNET LOGICAL LIBRARY OF THE HPCC SOFTWARE EXCHANGE

Ross Biro Sep. 1993 22 p

(Contract NAS2-13721)

(NASA-CR-194545; NAS 1.26:194545; RIACS-TR-93.09) Avail: CASI HC A03/MF A01

As the quantity of information available on the Internet grows, locating a particular piece of information becomes more difficult. One possible solution is for a database of pointers to all available information to be maintained at a central site. Subject classifications for all the information could also be maintained in order to make searching possible. This paper describes one possible method of searching such an index. In particular a prototype browsing tool has been created using TCL/TK to demonstrate several possible features: rapidly scanning at any rank of the index, narrowing the index to any scope, regular-expression searching, and creation of a list of pointers answering to any set of index terms. The prototype browser is an easy-to-use independent X application designed for use in the Catalog of Repositories of the HPCC (High Performance Computing and Communications) Software Exchange. FINDING STABLE ORIENTATIONS OF ASSEMBLIES WITH LINEAR PROGRAMMING

David Baraff, Raju Mattikalli, Bruno Repetto, and Pradeep Khosla Jun. 1993 21 p

(AD-A266990; CMU/RI-TR-93-13) Avail: CASI HC A03/MF A01

In the paper by Mattikalli et al.(5), the stability of an assemblage of frictionless contacting bodies with uniform gravity was considered. The problem of finding a stable orientation for such an assembly was formulated as a constrained maximun problem. A solution to the maximun problem yielded an orientation of the assembly that was stable under gravity; however, if no such orientation existed, then the solution to the maximun problem yielded the most stable orientation possible for the assembly. The maximun

problem was solved using a numerical iteration procedure that solved a linear program for each step of the iteration. In this paper, we show that the stability problem can be considered a variant of standard zero-sum matrix games. A solution to the maximun problem can be found by solving a single linear program. DTIC

CONCEPTS ON MEASURING THE BENEFITS OF SOFTWARE PROCESS IMPROVEMENTS Final Report

James A. Rozum Jun. 1993 52 p

(Contract F19628-90-C-0003)

(AD-A266994; CMU/SEI-93-TR-09; ESC-TR-93-186) Avail: CASI HC A04/MF A01

The software community initially became aware of process improvement from the works of Deming, Juran, and Crosby. The current awareness and activity regarding software process improvement was sparked by the Software Engineering Institute (SEI) with the release of its original software process maturity model. Following the advice of the SEI, many software organizations initiated software process improvement efforts to improve the quality of their products by improving the processes that produce those products. The question that many managers are continually asking today, though, is: How much has my organization benefited from the changes we have made? Unfortunately, many organizations did not include a method of measuring those benefits in their improvement activities. This report describes some concepts that organizations can tailor and build upon to develop a method for determining the benefits they have received from their software process improvement activities. DTIC

SOFTWARE ARCHITECTURE FOR SHARED INFORMATION SYSTEMS Final Report

Mary Shaw Mar. 1993 50 p

(Contract F19628-90-C-0003)

(AD-A266995; CMU/SEI-93-TR-3; ESC-TR-93-180) Avail: CASI HC A03/MF A01

Software system design takes place at many levels. Different kinds of design elements, notations, and analyses distinguish these levels. At the software architecture level, designers combine subsystems into complete systems. This paper studies some of the common patterns of idioms, that guide these configurations. Results from software architecture offer some insight into the problems of systems integration-the task of connecting individual, isolated, pre-existing software systems to provide coherent, distributed solutions to large problems. As computing has become more sophisticated, so too have the software structures used in the integration task. This paper reviews historical examples of shared information systems in three different applications whose requirements share some common features about collecting, manipulating, and preserving large bodies of complex information. These applications have similar architectural histories in which a succession of designs responds to new technologies and new requirements for flexible, highly dynamic responses. DTIC

A FORMAL LANGUAGE FOR THE SPECIFICATION AND VERIFICATION OF SYNCHRONOUS AND ASYNCHRONOUS CIRCUITS Final Report

David M. Russinoff Sep. 1993 89 p

(Contract NAS1-18878; RTOP 505-64-10-13)

(NASA-CR-191509; NAS 1.26:191509) Avail: CASI HC A05/MF A01

A formal hardware description language for the intended application of verifiable asynchronous communication is described. The language is developed within the logical framework of the Nqthm system of Boyer and Moore and is based on the event-driven behavioral model of VHDL, including the basic VHDL signal propagation mechanisms, the notion of simulation deltas, and the VHDL simulation cycle. A core subset of the language corresponds closely with a subset of VHDL and is adequate for the realistic gate-level modeling of both combinational and sequential circuits. Various extensions to this subset provide means for convenient expression of behavioral circuit specifications. Author (revised)

PARALLEL SPATIAL DIRECT NUMERICAL SIMULATIONS ON THE INTEL IPSC/860 HYPERCUBE Final Report

Ronald D. Joslin (National Aeronautics and Space Administration. Langley Research Center, Hampton, VA.) and Mohammad Zubair (Old Dominion Univ., Norfolk, VA.) Aug. 1993 46 p Submitted for publication

(Contract NAS1-19480; RTOP 505-90-52-01)

(NASA-CR-191513; NAS 1.26:191513; ICASE-93-53) Avail: CASI HC A03/MF A01

The implementation and performance of a parallel spatial direct numerical simulation (PSDNS) approach on the Intel iPSC/860 hypercube is documented. The direct numerical simulation approach is used to compute spatially evolving disturbances associated with the laminar-to-turbulent transition in boundary-layer flows. The feasibility of using the PSDNS on the hypercube to perform transition studies is examined. The results indicate that the direct numerical simulation approach can effectively be parallelized on a distributed-memory parallel machine. By increasing the number of processors nearly ideal linear speedups are achieved with nonoptimized routines; slower than linear speedups are achieved with optimized (machine dependent library) routines. This slower than linear speedup results because the Fast Fourier Transform (FFT) routine dominates the computational cost and because the routine indicates less than ideal speedups. However with the machine-dependent routines the total computational cost decreases by a factor of 4 to 5 compared with standard FORTRAN routines. The computational cost increases linearly with spanwise wall-normal and streamwise grid refinements. The hypercube with 32 processors was estimated to require approximately twice the amount of Cray supercomputer single processor time to complete a comparable simulation; however it is estimated that a subgrid-scale model which reduces the required number of grid points and becomes a large-eddy simulation (PSLES) would reduce the computational cost and memory requirements by a factor of 10 over the PSDNS. This PSLES implementation would enable transition simulations on the hypercube at a reasonable computational cost. Author (revised)

OPEN ENVIRONMENTS TO SUPPORT SYSTEMS ENGINEERING TOOL INTEGRATION: A STUDY USING THE PORTABLE COMMON TOOL ENVIRONMENT (PCTE)

Dave E. Eckhardt, Jr., Michael J. Jipping (Hope College, Holland, MI.), Chris J. Wild (Old Dominion Univ., Norfolk, VA.), Steven J. Zeil (Old Dominion Univ., Norfolk, VA.), and Cathy C. Roberts Sep. 1993 17 p

(RTOP 505-64-50-05)

(NASA-TM-4489; L-17202; NAS 1.15:4489) Avail: CASI HC A03/MF A01

A study of computer engineering tool integration using the Portable Common Tool Environment (PCTE) Public Interface Standard is presented. Over a 10-week time frame, three existing software products were encapsulated to work in the Emeraude environment, an implementation of the PCTE version 1.5 standard. The software products used were a computer-aided software engineering (CASE) design tool, a software reuse tool, and a computer architecture design and analysis tool. The tool set was then demonstrated to work in a coordinated design process in the Emeraude environment. The project and the features of PCTE used are described, experience with the use of Emeraude environment over the project time frame is summarized, and several related areas for future research are summarized. MULTIPHASE COMPLETE EXCHANGE: A THEORETICAL ANALYSIS Final Report
Shahid H. Bokhari (University of Engineering and Technology, Lahore, Pakistan.) Aug. 1993 28 p
(Contracts NAS1-19480; NAS1-18605; RTOP 505-90-52-01)
(NASA-CR-191531; NAS 1.26:191531; ICASE-93-64) Avail: CASI HC A03/MF A01

Complete Exchange requires each of N processors to send a unique message to each of the remaining N-1 processors. For a circuit switched hypercube with N = 2(sub d) processors, the Direct and Standard algorithms for Complete Exchange are optimal for very large and very small message sizes, respectively. For intermediate sizes, a hybrid Multiphase algorithm is better. This carries out Direct exchanges on a set of subcubes whose dimensions are a partition of the integer d. The best such algorithm for a given message size m could hitherto only be found by enumerating all partitions of d. The Multiphase algorithm is analyzed assuming a high performance communication network. It is proved that only algorithms corresponding to equipartitions of d (partitions in which the maximum and minimum elements differ by at most 1) can possibly be optimal. The run times of these algorithms plotted against m form a hull of optimality. It is proved that, although there is an exponential number of partitions, (1) the number of faces on this hull is Theta(square root of d), (2) the hull can be found in theta(square root of d) time, and (3) once it has been found, the optimal algorithm for any given m can be found in Theta(log d) time. These results provide a very fast technique for minimizing communication overhead in many important applications, such as matrix transpose, Fast Fourier transform, and ADI. Author (revised)

REACTIVE SYSTEM VERIFICATION CASE STUDY: FAULT-TOLERANT TRANSPUTER COMMUNICATION
D. Francis Crane and Philip J. Hamory Sep. 1993 12 p Sponsored by NASA, Washington
(RTOP 505-64-52)
(NASA-TM-108784; A-93103; NAS 1.15:108784) Avail: CASI HC A03/MF A01

A reactive program is one which engages in an ongoing interaction with its environment. A system which is controlled by an embedded reactive program is called a reactive system. Examples of reactive systems are aircraft flight management systems, bank automatic teller machine (ATM) networks, airline reservation systems, and computer operating systems. Reactive systems are often naturally modeled (for logical design purposes) as a composition of autonomous processes which progress concurrently and which communicate to share information and/or to coordinate activities. Formal (i.e., mathematical) frameworks for system verification are tools used to increase the users' confidence that a system design satisfies its specification. A framework for reactive system verification includes formal languages for system modeling and for behavior specification and decision procedures and/or proof-systems for verifying that the system model satisfies the system specifications. Using the Ostroff framework for reactive system verification, an approach to achieving fault-tolerant communication between transputers was shown to be effective. The key components of the design, the decoupler processes, may be viewed as discrete-event-controllers introduced to constrain system behavior such that system specifications are satisfied. The Ostroff framework was also effective. The expressiveness of the modeling language permitted construction of a faithful model of the transputer network. The relevant specifications were readily expressed in the specification language. The set of decision procedures provided was adequate to verify the specifications of interest. The need for improved support for system behavior visualization is emphasized. Author (revised)

AN ANALYSIS OF SEI SOFTWARE PROCESS ASSESSMENT RESULTS: 1987-1991 Final Report
David H. Kitson and Stephen Masters Jul. 1992 37 p
(Contract F19628-90-C-0003)
(AD-A266996; CMU/SEI-92-TR-24; ESC-TR-92-24) Avail: CASI HC A03/MF A01

This report focuses on the results of SEI (Software Engineering Institute) software process assessments conducted over a four year period beginning in 1987. It characterizes the software processes used by software managers and practitioners at the assessed sites and classifies issues identified during the assessments. The basis for the characterization and classification is a software process maturity model developed by the SEI. This report contributes to the existing body of knowledge on the state of practice of software engineering in the U.S. by characterizing the sites from a software process maturity perspective and profiling site software process weaknesses. The data analyzed is drawn from SEI software process assessments of 59 government and industry software sites. This work is an analysis of existing assessment data rather than a designed study. The participating sites were not randomly selected; accordingly, they do not necessarily constitute a statistically valid sampling of the U.S. software industry. DTIC

PROCESS-CENTERED DEVELOPMENT ENVIRONMENTS: AN EXPLORATION OF ISSUES Final Report
Alan M. Christie Jun. 1993 74 p
(Contract F19628-90-C-0003)
(AD-A266997; CMU/SEI-93-TR-04; ESC-TR-93-181) Avail: CASI HC A04/MF A01

Software development environments are beginning to move from research communities to commercial applications. As this occurs, the need to address process issues related to such environments is becoming increasingly apparent. Thus there is a growing awareness of the need for process-centered development environments (PCDEs). This report addresses process definition and enactment issues which pertain to the specification and design of a PCDE. The first part of the report explores some of the required characteristics of an enactable graphical language and the relationship between process definition and enactment. This process language naturally led to the ability to perform process verification, i.e., a verification that the actual process path taken throughout a project conforms to the defined process. The issue of process verification is thus also explored. The success of PCDEs rests heavily on end-user acceptance. Because of this, the report concludes with a review of user-oriented process and social issues relevant to the successful adoption of PCDEs. DTIC

DEPENDABLE SOFTWARE TECHNOLOGY EXCHANGE Final Report
Charles B. Weinstock and Fred B. Scheneider Jun. 1993 34 p
(Contract F19628-90-C-0003)
(AD-A267103; CMU/SEI-93-SR-04) Avail: CASI HC A03/MF A01

On 18 and 19 Mar. 1993, the Dependable Real-Time Software Project hosted a Dependable Software Technology Exchange. The exchange, sponsored by the Air Force Space and Missile Systems Center and the Office of Naval Research, brought together researchers and system developers, providing an opportunity for the researchers to learn the needs of the developers and for the developers to learn about techniques being investigated by the researchers. This report summarizes what transpired at the meeting. DTIC

A SOFTWARE INTERFACE FOR THE ARL WIND TUNNEL DATA ACQUISITION SYSTEM
B. D. Fairlie and S. S. Sam Mar. 1993 55 p
(AD-A267114; ARL-TR-14; DODA-AR-007-135) Avail: CASI HC A04/MF A01

A software interface for the data acquisition system has been developed on a MicroVAX II computer for the transonic and low speed wind tunnels at ARL. The software is responsible for handling instrumentation control and data transfer requests between the data acquisition software and the parallel data bus via a DRV11 parallel I/O interface adapter. Access to the DRV11 registers is effected by direct mapping of the Q22-Bus I/O page to program variables, giving fast and efficient transfer of data to and from the parallel data bus. Up to five processes may access the parallel data bus at one time via this software interface thus allowing great flexibility in the development of data acquisition software. This report details the necessary programming steps which must be included in data acquisition software to access the parallel data bus via the software interface. DTIC

REENGINEERING: AN ENGINEERING PROBLEM Special Report
Peter H. Feiler Jul. 1993 42 p
(Contract F19628-90-C-0003)
(AD-A267117; CMU/SEI-93-SR-5) Avail: CASI HC A03/MF A01

This paper discusses a plan that addresses how the Software Engineering Institute (SEI) may assist the Department of Defense (DoD) in reengineering its large software-intensive systems. This plan is based on a view of reengineering as an engineering problem to improve the cost-effective evolution of large software-intensive systems. This view of reengineering, which takes the whole software engineering process into account, fosters a growth path by leveraging promising emerging software engineering technologies. Reengineering also builds on the industry's improvement in its ability to manage the software engineering process, an accomplishment of SEI work in the Capability Maturity Model (CMM) and its key process areas. MULTIOBJECTIVE FUNCTIONS OPTIMIZATION FOR TASK ALLOCATION MAPPING TO MULTICOMPUTER NODES Final Report
Jesse Williams 7 Aug. 1992 14 p
(NR Proj. RS3-4-P-11)
(AD-A267071; NAWCADWAR-92103-70) Avail: CASI HC A03/MF A01

The Naval Air Warfare Center-Aircraft Division Warminster, Software and Computer Technology Division, is developing software to allocate tasks to multicomputer nodes such that multiple objectives are optimized. The eventual goal of this project is to allow the decision maker to have design optimization capabilities available to her/him when designing complex system. Two key aspects of the allocation problem are discussed: (1) the techniques used to treat multiple objectives simultaneously; and (2) the techniques used to perform the search for the optimal set of model parameters. The report discusses current research reported in the literature and makes several suggestions for continuing the current effort. The current technique being used for treating multiple objectives simultaneously is to use a weighted sum of each of the individual objective functions as the objective function for the search. It is suggested that a vector of objective functions approach be implemented and experimentally compared to the weighted sum approach. Two algorithms are being used in the software: the genetic algorithm and the simulated annealing algorithm. DTIC

INTEGRATED TRUSTED SYSTEMS DEVELOPMENT ENVIRONMENT Final Report
Tanya Korelsky and David Rosenthal May 1993 72 p
(Contract F30602-91-C-0058)
(AD-A267029; RL-TR-93-49) Avail: CASI HC A04/MF A01

This document is the Final Report of the Integrated Trusted Systems Development Environment (ITSDE) project. The ITSDE project was a feasibility study that addressed the software development process for trusted systems. The goals of this effort were as follows: (1) to elaborate the Integrated Development Process (IDP) for trusted systems outlined in 'Developing Trusted Systems Using DoD-STD-2167A' and to elaborate the corresponding documentation suite; and (2) to investigate how formal specification and verification tools developed at ORA for Rome Laboratory fit into the elaborated IDP for trusted systems of high assurance. The IDP attempts to integrate activities by the DOD-STD2167A and the 'Trusted Computer System Evaluation Criteria' (TCSEC) into a unified approach for the development of trusted systems. We chose to investigate the elaboration of the IDP by developing requirements, design, and formal specification of a particular example. This approach allowed us to illustrate the findings and recommendations produced by the study. As our example for the study we chose to add a trusted mail service, which we call the Trusted Mail Handler, to the THETA (Trusted Heterogeneous Architecture) distributed operating system. THETA adds trusted distributed operating system functionality on top of commercial-off-the-shelf (COTS) trusted operating systems. DTIC

SOFTWARE RELIABILITY MANAGEMENT THROUGH METRICS M.S. Thesis
Douglas R. Burton Mar. 1993 70 p
(AD-A267129) Avail: CASI HC A04/MF A01

As systems become increasingly software dependent, their reliability will accordingly depend more so on the reliability of their resident software. Just as techniques and processes were developed and improved to ensure hardware reliability, so must techniques evolve to ensure software reliability. Two questions are addressed by this thesis. First, how do we measure software reliability throughout a project's lifecycle? Second, is there a tool which will provide effective insight into the test-now-or-later problem? The solution to our first question is a U.S. Army software procurement methodology which is briefly outlined as the overall framework for software procurement in this thesis. A software fault analysis tool is developed and programmed. Some results from this algorithm are provided and their potential resource saving impact explored. Program managers of software-intensive projects would be well advised to use the Army's methodology and this fault analysis tool to potentially save critically short procurement resources. DTIC

THE FREE DECAY OF COUPLED HEAVE AND PITCH MOTIONS OF A MODEL FRIGATE
P. Crossland, P. A. Wilson (Southampton Univ., England.), and J. C. Bradburn (Imperial Coll. of Science and Technology, London, England.) Oct. 1992 27 p
(DRA/TM(AWMH)92340; BR315173; ETN-93-94503) Copyright Avail: CASI HC A03/MF A01

A comparison of the heave and pitch motion decay time histories together with the analytical decay time histories synthesized using the hydrodynamic coefficients predicted by the PAT-91 ship motion computer program is provided. The PAT-91 ship program was found to overpredict damping especially at resonant frequencies, resulting in there being no significant peak in the transfer function of pitch at resonance. The results of a series of experiments that measured the decay time histories of a model frigate free to move in the vertical plane, in an attempt to identify where the problems might be occurring, are presented. Judgements are made concerning the components in the heave and pitch motions using the terms in the full two dimensional strip theory heave and pitch motion equations to explain the trends shown. The investigation showed that the

sectional damping coefficient appears to be over predicted. This results in a relatively poor prediction of heave decay curves at low speed and overestimates the damping in the pitch decay curves. It appears that the discrepancies seen in the heave and pitch transfer functions could be due to the wave excitation being predicted incorrectly. ESA

LINEAR ENCODING DEVICE Patent Application
Douglas B. Leviton, inventor (to NASA) 29 Mar. 1993 22 p
(NASA-Case-GSC-13562-1; NAS 1.71:GSC-13562-1;
US-Patent-Appl-SN-037876) Avail: CASI HC A03/MF A01

A Linear Motion Encoding device for measuring the linear motion of a moving object is disclosed in which a light source is mounted on the moving object and a position sensitive detector such as an array photodetector is mounted on a nearby stationary object. The light source emits a light beam directed towards the array photodetector such that a light spot is created on the array. An analog-to-digital converter, connected to the array photodetector is used for reading the position of the spot on the array photodetector. A microprocessor and memory is connected to the analog-to-digital converter to hold and manipulate data provided by the analog-to-digital converter on the position of the spot and to compute the linear displacement of the moving object based upon the data from the analog-to-digital converter. REPORT ON COMPUTING AND NETWORKING IN THE SPACE SCIENCE LABORATORY BY THE SSL COMPUTER COMMITTEE
D. L. Gallagher, ed. Sep. 1993 18 p Sponsored by NASA, Washington
(NASA-TM-108422; NAS 1.15:108422) Avail: CASI HC A03/MF A01

The Space Science Laboratory (SSL) at Marshall Space Flight Center is a multiprogram facility. Scientific research is conducted in four discipline areas: earth science and applications, solar-terrestrial physics, astrophysics, and microgravity science and applications. Representatives from each of these discipline areas participate in a Laboratory computer requirements committee, which developed this document. The purpose is to establish and discuss Laboratory objectives for computing and networking in support of science. The purpose is also to lay the foundation for a collective, multiprogram approach to providing these services. Special recognition is given to the importance of the national and international efforts of our research communities toward the development of interoperable, network-based computer applications. ACM SIGPLAN WORKSHOP ON ML AND ITS APPLICATIONS
Peter Lee Jun. 1992 209 p Workshop held in San Francisco, CA, 20-21 Jun. 1992
(AD-A266617; CMU-CS-93-105) Avail: CASI HC A10/MF A03

The Workshop on ML and its Applications was held June 20-21, 1992 in San Francisco, CA, in conjunction with the ACM SIGPLAN '92 Conferences and Workshops. The ML programming language has been an important tool and framework for research in language design and implementation. As the language and its implementations have matured, the range of applications has increased greatly. New applications, combined with new ideas in design and implementation, have stimulated a large number of significant activities in research and software development. This workshop, like the previous workshops in Princeton, Edinburgh, and Pittsburgh, provided a forum for theses activities, with a special emphasis on applications of the language. A total of 21 abstracts were selected for presentation and discussion at the workshop: 12 were chosen for conference-style presentations and 9 for presentation in a poster session. DTIC

ARCHITECTURES FOR SOFTWARE SYSTEMS: A CURRICULUM DEVELOPMENT PROPOSAL IN UNDERGRADUATE SOFTWARE ENGINEERING Final Technical Report, 1 Jan. - 31 Dec. 1992
David Garlan and Mary Shaw May 1993 23 p
(Contract MDA972-92-J-1002)
(AD-A266703) Avail: CASI HC A03/MF A01

This curriculum development project had as its primary goal the development of a course that augments existing undergraduate software curricula by teaching concepts, techniques, and examples at the architectural level of software design. Specifically, Architectures for Software Systems would: (1) teach students how to understand and evaluate designs of existing software systems from an architectural perspective; (2) provide students with the intellectual building blocks for designing new systems in principled ways using well-understood architectural paradigms; (3) show students how formal notations and models can be used to characterize and reason about a system design; and (4) familiarize students with concrete examples of actual system architectures that can serve as models for new designs. USING INTERACTIVE SKETCH INTERPRETATION TO DESIGN SOLID OBJECTS Ph.D. Thesis
David Pugh 4 Apr. 1993 101 p
(AD-A266637; CMU-CS-93-147) Avail: CASI HC A06/MF A02

Before the introduction of Computer Aided Design and solid modeling systems, designers had developed a set of methods for designing solid objects by sketching their ideas using pencil and paper and refining these ideas into workable designs. These methods are different from those used for designing objects with a conventional solid modeler. Not only does this dichotomy waste a vast reserve of talent and experience (people typically start sketching from the moment they first pick up a crayon), but it also has a more fundamental problem: designers can use their intuition more effectively when sketching than they can when using a solid modeler. This dissertation introduces interactive sketch interpretation as a new user interface paradigm for solid modeling systems. Interactive sketch interpretation makes it possible to use the computer as a sketchpad for designing three-dimension objects. The premise behind interactive sketch interpretation is to let the designer change an object's design by modifying a computer generated the line drawing of the object. Sketch interpretation maps the designer's changes onto a boundary representation model of the object. The designer can continue the design process by then changing the line drawing of the modified object. This design cycle is highly interactive and, as a result, incorrect interpretations can be easily corrected by the designer. Viking is a solid modeling system whose user interface is based on interactive sketch interpretation. With Viking, the designer can modify his or her design by either changing the line drawing or placing geometric constraints on the object. Sketch interpretation changes Viking's model of the object so that it is consistent with the modified line drawing and the geometric constraints placed by the user. DTIC

THE BOOTSTRAPPED ALGORITHM: FAST ALGORITHM FOR BLIND SIGNAL SEPARATION Final Report, Mar. 1991 - Jun. 1992
Yeheskel Bar-Ness, A. Dinc, and H. Messer-Yaron Apr. 1993 249 p
Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F30602-88-D-0025)
(AD-A266671; RL-TR-93-24) Avail: CASI HC A11

An adaptive algorithm termed 'Bootstrapped Algorithm' is proposed and analyzed, and its performance is evaluated in this report. Using this algorithm as an interference canceller results in structures which are unique in that they are composed of multi-cancellers; each uses the outputs of other cancellers as references (desired signals) or in other forms to further improve performance. As a result of such unique structures, the bootstrapped algorithm is shown to perform as a 'Signal Separator' rather than as an interference canceller. Clearly, because it does not require a reference signal in the form of decision feedback or training sequence, it is sometimes justifiably referred to by the term 'Blind Separator.' DTIC

USER'S MANUAL FOR THE HYPGEN HYPERBOLIC GRID GENERATOR AND THE HGUI GRAPHICAL USER INTERFACE
William M. Chan (MCAT Inst., San Jose, CA.), Ing-Tsau Chiu (Overset Methods, Inc., Vacaville, CA.), and Pieter G. Buning Oct. 1993 44 p
(RTOP 505-59-00)
(NASA-TM-108791; A-93133; NAS 1.15:108791) Avail: CASI HC A03/MF A01

The HYPGEN program is used to generate a 3-D volume grid over a user-supplied single-block surface grid. This is accomplished by solving the 3-D hyperbolic grid generation equations consisting of two orthogonality relations and one cell volume constraint. In this user manual, the required input files and parameters and output files are described. Guidelines on how to select the input parameters are given. Illustrated examples are provided showing a variety of topologies and geometries that can be treated. HYPGEN can be used in stand-alone mode as a batch program or it can be called from within a graphical user interface HGUI that runs on Silicon Graphics workstations. This user manual provides a description of the menus, buttons, sliders, and typein fields in HGUI for users to enter the parameters needed to run HYPGEN. Instructions are given on how to configure the interface to allow HYPGEN to run either locally or on a faster remote machine through the use of shell scripts on UNIX operating systems. The volume grid generated is copied back to the local machine for visualization using a built-in hook to PLOT3D. Author

EFFICACY OF FLOCCULATING AND OTHER EMERGENCY WATER PURIFICATION TABLETS Final Report, Oct. 1989 - Sep. 1991
Edmund M. Powers May 1993 39 p
(AD-A266695) Avail: CASI HC A03/MF A01

Chlor-Floc (CF) emergency water purification tablets were tested in the following areas: bactericidal, viricidal, and cysticical efficacy; removal of turbidity and chemical agents in water at temperatures ranging from 5 to 25 C; and storage stability at 5, 25, and 40 deg C. The minimal required reduction was achieved for bacteria, Rotavirus, and Giardia, but CF did not achieve the required reduction of Poliovirus at any of the temperatures or time periods investigated. Clarification of water was effective in turbid waters, but filtration through a cloth is necessary to prevent flocculated sediment from entering the canteen. Removal of chemical agents from water was a function of the solubility of the chemical agent, the rate of hydrolysis, and the composition of the water. The free residual chlorine in CF tablets remained stable at 5 and 25 C for 27 months, but declined rapidly after three months at 40 C and three days at 60 C. To be acceptable to the Military, the tablets must be approved and registered by the EPA and must be stable during normal storage for three years. Commercial Item Descriptions have been written for CF tablets and for a kit containing tablets, filters, and a water treatment bag. Both may be procured through the Defense General Supply Center, Richmond, VA. DTIC

A SCIENTIFIC BASIS FOR COMPUTATIONAL SCIENCE
Raul E. Valdes-Perez May 1993 19 p
(AD-A266697; CMU-CS-93-162) Avail: CASI HC A03/MF A01

Computational science is a productive intellectual activity. It produces highly useful computer programs that require much creativity and ingenuity to develop. Moreover, computation is a powerful theoretical tool for natural scientists. However, can computational science have a scientific foundation, quite apart from its roles as a juxtaposition of disciplines and as another theoretical tool for scientists? That is, can computational science develop concepts that enable a broad systematic understanding of inference and discovery in science? This paper makes a case for an affirmative answer that relies on the concept of generic scientific task. We will argue that theoretical understanding is to be attained by identifying and automating such tasks. To develop the idea, we configure samples of previous work in computational science (broadly construed), lay a road map to guide further research, and suggest experimental tools to generate research problems and to re-deploy proven techniques. (Contract NAS2-13721)
(NASA-CR-194609; RIACS-TR-93.06; NAS 1.26:194609) Avail: CASI HC A03/MF A01

Implementing a data-parallel language such as Fortran 90 on a distributed-memory parallel computer requires distributing aggregate data objects (such as arrays) among the memory modules attached to the processors. The mapping of objects to the machine determines the amount of residual communication needed to bring operands of parallel operations into alignment with each other. We present a program representation called the alignment-distribution graph that makes these communication requirements explicit. We describe the details of the representation, show how to model communication cost in this framework, and outline several algorithms for determining object mappings that approximately minimize residual communication. CLOUDING TRACING: VISUALIZATION OF THE MIXING OF FLUID ELEMENTS IN CONVECTION-DIFFUSION SYSTEMS Final Report
Kwan-Liu Ma and Philip J. Smith (Utah Univ., Salt Lake City.) Washington Aug. 1993 17 p Submitted for publication Original contains color illustrations
(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-191529; NAS 1.26:191529; ICASE-93-62) Avail: CASI HC A03/MF A01; 1 functional color page

This paper describes a highly interactive method for computer visualization of the basic physical process of dispersion and mixing of fluid elements in convection-diffusion systems. It is based on transforming the vector field from a traditionally Eulerian reference frame into a Lagrangian reference frame. Fluid elements are traced through the vector field for the mean path as well as the statistical dispersion of the fluid elements about the mean position by using added scalar information about the root mean square value of the vector field and its Lagrangian time scale. In this way, clouds of fluid elements are traced and are not just mean paths. We have used this method to visualize the simulation of an industrial incinerator to help identify mechanisms for poor mixing. Author (revised)

C++ AS A LANGUAGE FOR OBJECT-ORIENTED NUMERICS

K. G. Budge, J. S. Peery, A. C. Robinson, and M. K. Wong 1993 13 p Presented at the European C++ Users Group Meeting, Munich, Germany, 7-9 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-015027; SAND-93-1353C; CONF-930791-1) Avail: CASI HC A03/MF A01

C++ is commonly described as an object-oriented programming language because of its strong support for classes with multiple inheritance and polymorphism. However, for a growing community of numerical programmers, an equally important feature of C++ is its support of operator overloading on abstract data types. The authors choose to call the resulting style of programming object-oriented numerics. They believe that much of object-oriented numerics is orthogonal to conventional object-oriented programming. As a case study, they discuss two strong shock physics codes written in C++ that they're currently developing. These codes use both polymorphic classes (typical of traditional object-oriented programming) and abstract data types with overloaded operators (typical of object-oriented numerics). They believe that C++ translators can generate efficient code for many numerical objects. However, for the important case of smart arrays (which are used to represent matrices and the fields found in partial differential equations) fundamental difficulties remain. The authors discuss the two most important of these, namely, the aliasing ambiguity and the proliferation of temporaries, and they present some possible solutions. DOE

The low cost and availability of clusters of workstations have lead researchers to re-explore distributed computing using independent workstations. This approach may provide better cost/performance than tightly coupled multiprocessors. In practice, this approach often utilizes wasted cycles to run parallel jobs. The feasibility of such a non-dedicated parallel processing environment assuming workstation processes have preemptive priority over parallel tasks is addressed. An analytical model is developed to predict parallel job response times. Our model provides insight into how significantly workstation owner interference degrades parallel program performance. A new term task ratio, which relates the parallel task demand to the mean service demand of nonparallel workstation processes, is introduced. It was proposed that task ratio is a useful metric for determining how large the demand of a parallel applications must be in order to make efficient use of a non-dedicated distributed system.

A TASK ADAPTIVE PARALLEL GRAPHICS RENDERER
S. Whitman 21 Dec. 1992 19 p Presented at the Siggraph 1993 Conference, Anaheim, CA, 2-6 Aug. 1993
(Contract W-7405-eng-48)
(DE93-017123; UCRL-JC-112572; CONF-930881-3) Avail: CASI HC A03/MF A01

This paper presents a graphics renderer which incorporates new partitioning methodologies of memory and work for efficient execution on a parallel computer. The Task Adaptive domain decomposition scheme is an image space method involving dynamic partitioning of rectangular pixel area tasks. The author shows that this method requires little overhead, allows coherence within a parallel context, handles worst case scenarios effectively, and executes efficiently with little processor synchronization necessary. Previous research in the area of memory and work decompositions for graphics rendering has been primarily limited to simulation studies and little practical experience. The algorithm presented here has been implemented on a scalable distributed memory multiprocessor and tested on a variety of input scenes. The author presents a theoretical and practical analysis in order to contrast its predicted and actual success. The implementation analysis indicates that load imbalance is the major cause of performance degradation at the higher processor counts. Even so, on a variety of test scenes, an average rendering speedup of 79 was achieved utilizing 96 processors on the BBN TC2000 multiprocessor with a processor efficiency range of 66% to 94%. DOE

A SEQUENTIAL QUADRATIC PROGRAMMING ALGORITHM USING AN INCOMPLETE SOLUTION OF THE SUBPROBLEM
W. Murray and F. J. Prieto May 1993 54 p
(Contract DE-FG03-92ER-25117)
(DE93-017439; SU-SOL-93-3; AD-A267216) Avail: CASI HC A04/MF A01

We analyze sequential quadratic programming (SQP) methods to solve nonlinear constrained optimization problems that are more flexible in their definition than standard SQP methods. The type of flexibility introduced is motivated by the necessity to deviate from the standard approach when solving large problems. Specifically we no longer require a minimizer of the QP subproblem to be determined or particular Lagrange multiplier estimates to be used. Our main focus is on an SQP algorithm that uses a particular augmented Lagrangian merit function. New results are derived for this algorithm under weaker conditions than previously assumed; in particular, it is not assumed that the iterates lie on a compact set. DOE

MODELS FOR REACTIVITY
Zohar Manna and Amir Pnueli 7 Jan. 1993 75 p
(Grants NAG2-703; AF-AFOSR-0057-90)
(AD-A266419; STAN-CS-92-1461) Avail: CASI HC A04/MF A01

A hierarchy of models that capture realistic aspects of reactive, realtime, and hybrid systems is introduced. On the most abstract level, the qualitative (non-quantitative) model of reactive systems captures the temporal precedence aspect of time. A more refined model is that of real-time systems, which represents the metric aspect of time. The third and most detailed model is that of hybrid systems, which allows the incorporation of continuous components into a reactive system. For each of the three levels, we present a computational model, a requirement specification language based on extensions of temporal logic, system description languages based on state charts and a textual programming language, proof rules for proving validity of properties, and examples of such proofs.

A DECISION CRITERIA TO SELECT AN ASSOCIATIVE-MEMORY ORGANIZATION THAT MINIMIZES THE EXECUTION TIME OF A MIX OF ASSOCIATIVE-SEARCH OPERATIONS Ph.D. Thesis
David W. Banton Jun. 1993 205 p
(AD-A266438; AFIT/DS/ENG/93-02) Avail: CASI HC A10/MF A03

The dissertation develops a decision criteria to select an associative-memory organization that minimizes the execution time of a mix of associative-search operations and a decision criteria to estimate the layout dimensions of each organization for a specified memory size. The dissertation reclassifies Feng's associative-search operations into three hardware-influenced categories: bit-position independent (BPI), record-content independent (RCI); bit-position dependent (BPD), RCI; and BPD, record-content dependent (RCD). It develops a relationship between the categories and three associative-memory organizations: the CAM, the bit-serial word-parallel associative memory (BSWPAM), and the extreme-search associative memory (ESAM). A version of the CAM, three versions of the BSWPAM, and a version of the ESAM organizations were designed and simulated to show that for most memory sizes, BPI, RCI operations require less time when executed on a CAM, BPD, RCI operations require less time when executed on a BSWPAM organization, and for many memory sizes, BPD, RCD operations require less time when executed on an ESAM. The dissertation calculates the layout dimensions of each memory. The results indicate the CAM is the most area efficient followed by the single, and two BSWPAM, the ESAM, and the four BSWPAM.

(TR-444) Avail: CASI HC A03/MF A01

In ordinary first order logic, a valid inference in a language L is one in which the conclusion is true in every model of the language in which the premises are true. To accommodate inductive/uncertain/probabilistic/non-monotonic inference, we weaken that demand to the demand that the conclusion be true in a large proportion of the models in which the premises are true. More generally, we say that an inference is (p,q) valid if it is true in a proportion lying between p and q of those models in which the premises are true. If we include a statistical variable binding operator 'percent' in our language, there are many quite general things we can say about uncertain validity. Author (revised)

This paper is concerned with three basic questions about sparse sets: With respect to what types of reductions might NP have hard or complete sparse sets?; If a set A reduces to a sparse set, does it follow that A is reducible to some sparse set that is 'simple' relative to A?; With respect to what types of reductions might NP have hard or complete sets of low instance complexity, and, relatedly, what is the structure of the class of sets with low instance complexity?; With respect to the first and third questions, intuitively one would expect that even with respect to flexible reductions NP is unlikely to have complete sets whose information content is low. With respect to the second question, one might intuitively feel that the structure imposed on a set by the fact that it reduces to a sparse set makes it plausible that we can indeed find a simple sparse set that can masquerade as the original sparse set. These two intuitions are in many ways certified by the current literature, and by the results of this paper. Derived from text

USING MULTIPLE ADAPTIVELY-WEIGHTED STRATEGIES FOR THE RESOLUTION OF DEMONSTRATIVES Ph.D. Thesis
Ralf D. Brown 10 May 1993 188 p
(AD-A266463; CMU-CS-93-148) Avail: CASI HC A09/MF A02

The resolution of demonstratives is an interesting topic which nonetheless has received relatively little attention. As with pronominal anaphora, there is currently no comprehensive theory of demonstrative references, although there are numerous partial or microtheories. This dissertation describes a multistrategy approach to resolving demonstrative pronouns and noun phrases, using constraint, preference, and recovery strategies implementing various microtheories and heuristics. The multistrategy approach, which has proven itself for resolving pronominal anaphora, allows easy integration of new microtheories. This provides incremental improvements in performance, permitting a decreasing reliance on user intervention as the system is able to resolve a larger percentage of demonstratives. A major weakness of the multistrategy approach, the necessity to carefully choose the weights of the strategy is overcome by automatically optimizing the weights as demonstratives are resolved. Such an adaptively-weighted multistrategy approach has been implemented in the modular and extensible MASTER-D system which is expected to be applicable to other linguistic phenomena in addition to the resolution of demonstratives. GENERAL MONTE CARLO RELIABILITY SIMULATION CODE INCLUDING COMMON MODE FAILURES AND HARP FAULT/ERROR-HANDLING
M. E. Platt, E. E. Lewis, and F. Boehm Jan. 1991 101 p
(Grant NAG1-1031; RTOP 505-66-21)
(NASA-CR-187587; NAS 1.26:187587) Avail: CASI HC A06/MF A02

A Monte Carlo Fortran computer program was developed that uses two variance reduction techniques for computing system reliability applicable to solving very large highly reliable fault-tolerant systems. The program is consistent with the hybrid automated reliability predictor (HARP) code which employs behavioral decomposition and complex fault-error handling models. This new capability is called MC-HARP which efficiently solves reliability models with non-constant failures rates (Weibull). Common mode failure modeling is also a specialty. Author

DISCOVERING SEQUENCE SIMILARITY BY THE ALGORITHMIC SIGNIFICANCE METHOD
A. Milosavljevic Feb. 1993 11 p Presented at the 1st International Conference in Intelligent Systems for Molecular Biology, Washington, DC, 7-9 Jul. 1993
(Contracts W-31-109-eng-38; DE-FG03-91ER-61152)
(DE93-015556; ANL/BIM/CP-78918; CONF-930745-2) Avail: CASI HC A03/MF A01

The minimal-length encoding approach is applied to define concept of sequence similarity. A sequence is defined to be similar to another sequence or to a set of keywords if it can be encoded in a small number of bits by taking advantage of common subwords. Minimal-length encoding of a sequence is computed in linear time, using a data compression algorithm that is based on a dynamic programming strategy and the directed acyclic word graph data structure. No assumptions about common word ('k-tuple') length are made in advance, and common words of any length are considered. The newly proposed algorithmic significance method provides an exact upper bound on the probability that sequence similarity has occurred by chance, thus eliminating the need for any arbitrary choice of similarity thresholds. Preliminary experiments indicate that a small number of keywords can positively identify a DNA sequence, which is extremely relevant in the context of partial sequencing by hybridization. DOE

Kleisli categories over monads have been used in denotational semantics to describe functional languages using various notions of computations as values. Kleisli categories over comonads have also been used to describe intensional semantics rather than extensional. This paper explores the possibilities of combining monads and comonads to obtain an intensional semantics using computations as values. We give three alternative ways to combine the two and explore which apply to known monads and comonads of interest. We will also look at various intensional semantics for an example programming language that uses monads for computations and compare them to the original extensional semantics. DTIC

EIGENFUNCTIONS OF THE TRANSFER MATRIX IN THE PRESENCE OF LINEAR COUPLING
G. Parzen 1993 4 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contract DE-AC02-76CH-00016)
(DE93-015020; BNL-48268; CONF-930511-161) Avail: CASI HC A01/MF A01

This paper presents an approach to computing the change in the linear orbit parameters, due to a perturbing field that couples the x and y motions, by computing to change in the eigenfunctions of the transfer matrix and then using the relationship between the eigenfunctions and the orbit parameters. This can be compared with the approach that computes the change in the transfer matrix and uses the relationship between the elements of the transfer matrix and the orbit parameters. For the case of coupled motion, the eigenfunction approach appears to be easier to apply than the transfer matrix approach, partly because the relationship between the transfer matrix and the linear orbit parameters is considerably more complicated in this case. Results are found for the change in the four eigenfunctions of the transfer matrix in the presence of linear coupling and for the relationship between the eigenfunctions and the orbit parameters. (Contract MDA972-92-C-0026)
(AD-A266285; SAIC-93/1069) Avail: CASI HC A05/MF A01

The Software Integration Platform (SIP) supports automated and interactive distributed processing for the Intelligent Monitoring System (IMS). The SIP addresses the practical problem of integrating existing software and data archives into a processing system distributed on a network of UNIX workstations. It consists of software components that are widely applicable to other scientific data-processing operations. The SIP is divided into two subsystems. The Data Management System (DMS) manages shared data stored in archives distributed over a wide-area network. The Distributed Applications Control System (DACS) handles inter-process communication (IPC) and process control for user applications distributed over a local-area network. The data archives managed by the DMS consists of commercial relational database management systems (RDBMS) supplemented by UNIX file systems. User applications access data stored in the archives through the Data Management System Interface (DMSI). The DMSI allows global access to data independent of a specific physical archive. Because IMS requires the capabilities provided by commercial RDBMS products, the DMSI includes extensive support for these products. The CommAgent provides message routing and queueing. DTIC

CONFLICT RESOLUTION (CORE) FOR SOFTWARE QUALITY FACTORS Final Report, May 1990 - Sep. 1992
Jeffrey A. Lasky and Kevin H. Donaghy May 1993 40 p
(Contract F30602-88-D-0026)
(AD-A267248; RL-TR-93-80) Avail: CASI HC A03/MF A01

The software quality problem can be formulated as maximizing the quality goals within the constraints of cost, schedule, and technical feasibility. This is a difficult problem which belongs to a class known as multiobjective

or multiattribute optimization problems. These problems are characterized by the presence of multiple, conflicting goals accompanied by a large candidate solution space. The goals conflict because they are somehow interrelated. In software development, there are several quality characteristics, or software quality factors, that inherently conflict. For example, efficiency and maintainability conflict and the objective is to improve code understandability, since efficiency frequently required reliance on exceptional code. The same is true for expandability and reliability (increased risk to acquire more functionality), safety and availability (fail-soft/failsafe requirements reduce the set of available system capabilities). This effort developed a prototype tool which provides computer support for the Rome Laboratory Software Quality Methodology. Conflict Resolution (CORE) determines whether quality factor goals are achievable. If not, CORE then adjusts factor goals until an achievable solution is identified. In a session, there may be several candidate solutions. DTIC

DEVELOPMENT OF DYNAMIC, CONTEX-DRIVEN HELP SYSTEMS M.S. Thesis
Nancy J. McClellan Mar. 1993 128 p
(AD-A267409) Avail: CASI HC A07/MF A02

This thesis develops a methodology to identify and employ elements of the user's context in the help system architecture, thereby improving the response provided by the online help system. Typical online help system structures are static, providing a pre-programmed response to a specific assistance request and are not effected by the dynamics of the user or the task being attempted. A dynamic, context driven help system has been developed that uses user- and system-based components of the working environment to influence the system access and presentation strategies. The provided response is tailored specifically to the user, based on the user's level of experience and help system command history; and specifically to the situation, based on the task being attempted. The resulting online system provides a more flexible interface that can serve the needs of all types of users and can evolve as the user's skill with the application grows. The dynamic, context-driven help system methodology is explained through design and implementation of a prototype help system for an interactive software environment. TAE+ Help is a help component designed to assist users of the Transportable Application Environment Plus (TAE+). It is initiated separately from TAE+ but runs concurrently in the XWindows environment. When the user requests assistance, TAE+ Help initiates a dialogue with the user, collecting situational environmental information and employs these dynamics in the help system access process. DTIC

SEQUENTIAL FUNCTIONS ON INDEXED DOMAINS AND FULL ABSTRACTION FOR A SUB-LANGUAGE OF PCF
Stephen Brookes and Shai Geva Apr. 1993 16 p Submitted for publication
(Grant NSF CCR-90-06064)
(AD-A267838; CMU-CS-93-163) Avail: CASI HC A03/MF A01

We present a general semantic framework of sequential functions on domains equipped with a parameterized notion of incremental sequential computation. Under the simplifying assumption that computation other function spaces proceeds by successive application to constants, we construct a sequential semantic model for a non-trivial sub-language of PCF with a corresponding syntactic restriction - that variables of function type may only be applied to closed terms. We show that the model is fully abstract for the sub-language, with respect to the usual notion of program behavior. DTIC

APPLICABILITY OF COMPUTER SPREADSHEET SIMULATION FOR SOLVING RESOURCE ALLOCATION PROBLEMS M.S. Thesis
Dixon K. Hicks Mar. 1993 140 p
(AD-A267436) Avail: CASI HC A07/MF A02

This thesis investigates the possibility of employing computer spreadsheets as a sophisticated tool to resolve resource allocation dilemmas through simulation techniques. Microsoft's Excel 4.0 is used to analyze three separate and unique resource allocation problems: (1) an inventory distribution system involving different distribution points to illustrate the magnification of uncertainty as the distribution system is lengthened; (2) a queuing utilization problem faced by an emergency room of a hospital; and (3) a scenario that looks at the uncertainty in a financial budgeting situation as reflected in the Navy's CHAMPUS budget. A spreadsheet macro using simulation techniques is created for each scenario to illustrate that computer spreadsheets are fully capable of analyzing resource allocation enigmas through simulation methodology. (Contract F33615-89-D-2198)
(AD-A267447; WL-TR-93-3043) Avail: CASI HC A11/MF A03

In missile preliminary design it is necessary to quickly and economically estimate the aerodynamics of a wide variety of missile configuration designs. Since the ultimate shape and aerodynamic performance are so dependent upon the subsystems utilized, such as payload size, propulsion system selection, and launch mechanism, the designer must be capable of predicting a wide variety of configurations accurately. The fundamental purpose of Missile Datcom is to provide an aerodynamic design tool which has the predictive accuracy suitable for preliminary design and the capability for the user to easily substitute methods to fit specific applications. INTEL NX TO PVM 3.2 MESSAGE PASSING CONVERSION LIBRARY
Trey Arthur (Computer Sciences Corp., Hampton, VA.) and Michael L. Nelson Oct. 1993 14 p
(RTOP 505-90-53-02)
(NASA-TM-109038; NAS 1.15:109038) Avail: CASI HC A03/MF A01

NASA Langley Research Center has developed a library that allows Intel NX message passing codes to be executed under the more popular and widely supported Parallel Virtual Machine (PVM) message passing library. PVM was developed at Oak Ridge National Labs and has become the defacto standard for message passing. This library will allow the many programs that were developed on the Intel iPSC/860 or Intel Paragon in a Single Program Multiple Data (SPMD) design to be ported to the numerous architectures that PVM (version 3.2) supports. Also, the library adds global operations capability to PVM. A familiarity with Intel NX and PVM message passing is assumed. Author

EFFECTS OF INSPECTION ERROR ON OPTIMAL INSPECTION POLICIES AND SOFTWARE FAULT DETECTION MODELS Ph.D. Thesis
Donna C. Herge Aug. 1993 112 p
(AD-A267511; AFIT/CI/CIA-93-014D) Avail: CASI HC A06/MF A02

Inspection policies are essential for many types of systems for which the status (functioning or failed) can be determined only by actual inspection. Two types of inspection error may occur. A functioning system may be incorrectly assessed as having failed or a failed system may be incorrectly assessed as functioning. These errors are designated as Types I and II respectively, and their impact on optimal inspection policies and software fault detection models is analyzed. For a periodic inspection model with Type I error, an optimal replacement age is obtained, then monotonicity and asymptotic properties of the long-run expected cost per unit of time are presented. Type I error is incorporated into a cumulative damage model. When the failure density is reverse rule of order 2, an algorithm to compute an optimal inspection sequence is derived, and it is proven that optimal intervals are increasing. Extending the optimal inspection sequence model of Barlow, Hunter, and Proschan to include Type II inspection error, it is proven that optimal intervals are nonincreasing for a PF(sub 2) density, and an algorithm to compute optimal intervals is derived. Additionally, monoticity and majorization results are obtained for an optimal inspection sequence with Type II error. The impact of fault-detection error on a software release time model is shown. The effect of fault diversity on the Jelinski-Moranda model and how this relates to imperfect fault detection is demonstrated. DTIC

The Services and Information Management for Decision Systems (SIMS) project integrates several computer services into a single, seamless system, as seen from the user's perspective. This relieves the user of the need to be familiar with all the services available from the system, enabling the user to make requests as though he or she were dealing with a single entity. SIMS analyzes the user request, plans the necessary sequence of calls on the services, and executes them. Until now, the only approach to the problem of software integration has been to build custom systems that support an integrated view of the underlying servers. Such systems are expensive, are suitable only for the application for which they were crafted, are not very flexible with respect to functionality, and are difficult to modify. In contrast, SIMS would allow maintainers to assimilate servers into the system through a much less painful process of building a declarative model of the servers and allowing the SIMS planner to perform the actual integration task. VISUAL PARALLEL PROGRAMMING WITH DETERMINACY: A LANGUAGE SPECIFICATION, AN ANALYSIS TECHNIQUE, AND A PROGRAMMING TOOL
Adam Beguelin and Gary Nutt 7 Jun. 1993 36 p
(Grant NSF CCR-88-02283)
(AD-A267560; CMU-CS-93-166) Avail: CASI HC A03/MF A01

Phred is a visual parallel programming language in which programs can be statically analyzed for deterministic behavior. This paper presents the Phred language, techniques for analyzing the language, and a programming environment which supports Phred programming. There are many methods for specifying synchronization and data sharing in parallel programs. The Phred programmer uses graph constructs for describing parallelism, synchronization, and data sharing. These graphs are formally described in this paper as a graph grammar. The use of graphs in Phred provides an intuitive and visual representation for parallel computations. The inadvertent specification of nondeterministic computations is a common error in parallel programming. Phred addresses the issue of determinacy by visually indicating regions of a program where nondeterminacy may exist. This analysis and its integration into a programming environment is presented here. The Phred programming environment supports the specification, analysis, and execution of Phred programs. The distribution of the programming environment itself over several workstations is also described. DTIC

CAUSALITY-PRESERVING TIMESTAMPS IN DISTRIBUTED PROGRAMS
Adam Beguelin and Erik Seligman Jun. 1993 13 p
(Contract MDA972-90-C-0035; ARPA Order 7330)
(AD-A267534; CMU-CS-93-167) Avail: CASI HC A03/MF A01

A tachyon is an improperly ordered event in a distributed program. Tachyons are most often manifested as messages which are received before they are sent, violating the principle of causality. Although tachyons are not possible in real life, they may appear to occur in distributed parallel program traces due to coarse clock granularity or poor clock synchronization. In this paper, we establish that tachyons do in fact occur commonly in distributed programs on our Ethernet at Carnegie Mellon University, and we discuss some ways of eliminating them from program traces while preserving at least some knowledge of the length of time intervals in our programs. Our methods are based on Lamport-style clock corrections; when a process receives a message stamped with a later sending time, it sets its own clock ahead to a time at least as great as the sending timestamp. We have implemented this both in real time and in a more comprehensive post-processor for Xab. DTIC

MODULE INTERCONNECTION FRAMEWORKS FOR A REAL-TIME SPREADSHEET
Richard Clarke 30 May 1993 12 p
(AD-A267317) Avail: CASI HC A03/MF A01

The first month of this work has been very fruitful, yielding a detailed understanding of how module interconnection frameworks (MIF) can be used to implement specific features of a real-time distributed spreadsheet. A number of ideas will be presented in this report. These ideas envision a system which combines the advantages of high-level system design with the very rapid implementation/prototyping capabilities already demonstrated in numerous applications by the ControlCalc system. In particular, an MIF system solves a number of problems of distributed programming and of integrating service provided by the spreadsheet into a large scale modular system implemented in non-spreadsheet languages. The focus of the investigation so far has been Polylith, a software bus system developed at the University of Maryland. DTIC

MODULE INTERCONNECTION FRAMEWORKS FOR A REAL-TIME SPREADSHEET Progress Report
Richard Clark 29 Jul. 1993 12 p
(AD-A267752) Avail: CASI HC A03/MF A01

RTware is working on a proposal for an SBIR Phase 2 software research and development project for distributed control systems (DCS) using Module Interconnect Frameworks (MIF). SBIR Phase 1 work includes research into the feasibility, design and benefits of such a system, resulting in a detailed Phase 2 proposal. The proposed software package will be based on RTware's Control-Calc real-time spreadsheet control system and the Polylith MIF system from the University of Maryland. Work in the initial stage of Phase 1 has identified the main outlines of the package, and described key benefits to the Department of Defense (see the May 30th Progress Report). Work in the latest time period involved developing a detailed description of the proposed system and trying test implementations with the Polylith package. That description breaks the system down into two major components: The first component (DCS-I) is a distributed services capability for accessing remote procedures and data both into and out of the Control-Calc spreadsheet. The second component (DCS-II) will allow the largely transparent distribution of compiled Control-Calc code segment across remote, and heterogeneous, platforms. DTIC

COMPUTER MODELING AND ANIMATION OF MECHANICAL SYSTEMS
Li Wen and Behnam Bahr 1993 88 p
(NIAR-93-3) Avail: CASI HC A05/MF A01

A new methodology for mechanism modeling and animation using 2-D or 3-D computer graphics techniques is presented. Simulation systems based on this method enable mechanical designers, educators and management to evaluate the motion performance of mechanisms in effective, flexible and inexpensive ways. This method is particularly well suited for use in small manufacturing companies and educational institutes because of the small required expense. The emphasis is given to the system structure, the design procedures, and a wide variety of its applications.

A technique for reducing the spurious signal content in digital sinusoid synthesis is presented. Spur reduction is accomplished through dithering both amplitude and phase values prior to word-length reduction. The analytical approach developed for analog quantization is used to produce new bounds on spur performance in these dithered systems. Amplitude dithering allows output word-length reduction without introducing additional spurs. Effects of periodic dither similar to that produced by a pseudo-noise (PN) generator are analyzed. This phase dithering method provides a spur reduction of 6(M + 1) dB per phase bit when the dither consists of M uniform variates. While the spur reduction is at the expense of an increase in system noise, the noise power can be made white, making the power spectral density small. This technique permits the use of a smaller number of phase bits addressing sinusoid look-up tables, resulting in an exponential decrease in system complexity. Amplitude dithering allows the use of less complicated multipliers and narrower data paths in purely digital applications, as well as the use of coarse-resolution, highly-linear digital-to-analog converters (DACs) to obtain spur performance limited by the DAC linearity rather than its resolution.

AN OBJECT-ORIENTED DYNAMIC SOFTWARE PROCESS MODEL M.S. Thesis
Bradley J. Smith Jan. 1993 112 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A267726; AFIT/CI/CIA-93-092) Avail: CASI HC A06

This thesis describes a new method for modeling complex dynamic processes using object-oriented techniques. These techniques are applied to develop a sophisticated model of the software development process. This object-oriented approach has many advantages over non-object-oriented System Dynamics models. Non-homogeneous resource allocation can be explicitly modeled. This allows resource allocation strategies and management decisions to be modeled and assessed in a realistic manner. Since software development tasks and resources are modeled as objects, they can be flexibly created and manipulated to capture the dynamics of a particular project. Furthermore, the principles of object-oriented inheritance lets the modeler or analyst easily extend the model to include new resources and tasks. The thesis addresses major considerations in modeling the software development process, as well as the detailed development of an object-oriented software process model in C++. A comparison is done between this dynamic model and the empirical predictions of the popular COCOMO software estimation system. This new object-oriented approach is not limited to software process modeling and could be applied to a wide variety, of scientific, business, and social simulations.

The primary goals of the effort are to create methods for designing digital optical computers and to investigate aspects of optical interconnection that influence the design process. The emphasis is on the Bell Labs style of architecture, in which arrays of optical logic gates are interconnected in free space with regular patterns at the gate-level. Other approaches are also explored that make use of hybrid technology (smart pixels), irregular interconnects, and reconfigurable interconnects.

ESTABLISHING A SOFTWARE MEASUREMENT PROCESS
Donald R. McAndrews Jul. 1993 54 p Sponsored by AFSC
(AD-A267896; CMU/SEI-93-TR-16; ESC-TR-93-193) Avail: CASI HC A04/MF A01

This report presents guidelines for establiishing a measurement process as part of an organization's overall software process. Methods are suggested that can be used to design a repeatable measurement process that is focused on goal setting, data analysis, and decision making rather than on just data collection and numbers. Examples are included to illustrate these methods in the context of some common software process management issues involving basic measures of size, effort, and schedule. This report also suggests some steps for starting a measurement program. These

steps focus on identifying an organizational strategy for improvement and designing a process for measurement to support this strategy. DTIC

PROCESS EVOLUTION FOR THE MARVEL ENVIRONMENT
Gail E. Kaiser, Israel Z. Ben-Shaul, George T. Heineman, John K. Hinsdale, and Wilfredo Marrero 8 Nov. 1992 32 p
(Grants NSF CCR-91-06368; NSF CCR-88-58029)
(AD-A267813; CUCS-047-92) Avail: CASI HC A03/MF A01

We present a schema and process evolution tool, called the Evolver, for the MARVEL process-centered environment. The Evolver analyzes the differences between the new and installed process models of an existing environment and detects each case where the notion of consistency defined by the process model has been strengthened or weakened. The Evolver then automatically updates the environment's object-base to guarantee that the objects are consistent according to the new specifications. The Evolver can be applied while the installed process is in progress, temporarily halting normal operation while it updates the object-base, after which development continues using the new process. We have had several months of experience using the Evolver to make repeated changes in the process that supports our own further development of MARVEL and include in this paper one small but practical example of a recent change made to a real MARVEL process. CONCURRENCY CONTROL IN RULE-BASED SOFTWARE DEVELOPMENT ENVIRONMENTS Ph.D. Thesis
Naser S. Barghouti 1992 286 p
(AD-A267829; TR/CUCS-001-92) Avail: CASI HC A13/MF A03

This dissertation investigates the concurrency control problem in software development environments (SDE's). The problem arises when multiple developers perform activities that concurrently access the project's components, stored as database objects. The interleaved execution of the developers' activities leads to interference if they access overlapping sets of objects concurrently. An SDE can ensure that activities never interfere by modeling their execution in terms of atomic transactions and allowing only serializable schedules. This prevents cooperation, which requires some degree of interference between the activities of multiple developers. To allow cooperation, an SDE must be provided with semantic information about development activities. In rule-based SDE's, the necessary information is readily available in the set of rules that defines the process model of a project. The rules are loaded into the SDE, which provides process-specific assistance through a rule chaining engine. A single user command might lead the chaining engine to initiate a rule chain. The concurrency control problem in rule-based SDE's manifests itself in terms of interference between concurrent rule chains. We present a mechanism that extracts semantic information from the process model to solve the concurrency control problem without obstructing cooperation. DTIC

INCREMENTAL REDERIVATION OF SOFTWARE ARTIFACTS: FY 1992 Final Report, Oct. 1991 - Sep. 1992
Melissa Chase, Howard Reubenstein, and Alexander Yeh May 1993 19 p
(Contract F19628-89-C-0001)
(AD-A267968; RL-TR-93-60) Avail: CASI HC A03/MF A01

Design relay presents a possible enabling technology to the Knowledge-Based Software Assistant specification maintenance and implementation derivation approach to software development. More generally, design replay can also be applied to derivations between a variety of different software description abstraction levels. Radical changes to a software artifact cannot generally be addressed by designed replay as they require new design input. Evolutionary changes are more amenable to design replay and often involve incremental changes to derived artifacts. This report outlines an approach to rederivation that exploits the incrementality of evolutionary maintenance changes, describes the state at which the implementation of this approach is at, and what remains to be done to test this approach. AUTOMATIC GENERATION OF PRODUCTION RULES FOR INTEGRITY MAINTENANCE

Stefano Ceri, Piero Fraternali, Stefano Paraboschi, and Letizia Tanca 29 Apr. 1993 47 p Sponsored by Commission of the European Communities and CNR

(Rept-92-054; ETN-93-94566) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

An approach to integrity maintenance, consisting of automatically generating production rules for integrity enforcement is presented. Constraints are expressed as particular formulas of Domain Relational Calculus; they are automatically translated into a set of compensating actions, encoded as production rules of an active database system. Prodution rules may be redundant (they enforce the same constraint in different ways) and conflicting (because repairing one constraint may cause the violation of another constraint). Thus, it is necessary to develop techniques for analyzing the properties of the set of active rules and for ensuring that any computation of production rules after any faulty transaction terminates and produces a consistent database state. Among these guidelines, a specific architecture for constraint definition and their enforcement is described. The components of the architecture include a Rule Generator, for producing all possible compensating actions, and a Rule Analyzer and Selector, for producing a collection of production rules such that their execution after a faulty transaction always terminates in a consistent state (possibly by rolling back the transaction); moreover, the needs of applications are modeled, so that integrity enforcing rules reach the final state that better represents the original intentions of the transaction's supplier. Experimental results of a prototype implementation of the proposed architecture are also described. ESA

ORPHEUS: A SYNTHESIS FRAMEWORK FOR REGULAR ARCHITECTURES

Franco Fummi Mar. 1993 29 p

(Rept-93-016; ETN-93-94568) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

A global methodology to extract from the behavioral description of a circuit all information concerning the regularity of the computation is presented; such regular parts of the entire circuit are easily implemented into systolic arrays. Some criteria to evaluate the optimal combination of scheduling and allocation of user's constraints are also presented. All such algorithms are implemented in Orpheus, a synthesis framework that guides the user to analyze different implementations and choose the optimal. The results achieved using Orpheus were checked on some benchmarks and the complete synthesis of a IIR (Infinite Impulse Response) filter is presented. The main innovative contributions may be summarized as follows: the analysis starts from a behavioral description of a circuit that is written using a general purpose language; the circuit description is translated into an internal representation (DFG/CFG (Data Flow Graph/Control FG)) suitable to analyze the main characteristics of different architectures, with focus on systolic arrays based architectures; an innovative methodology to extract the regular parts of the computation and to obtain a description useful to apply the Kung's synthesis strategy is presented; a set of criteria to choose the optimal combination of scheduling and allocation of a systolic array is explained with all parameters that can be constrained by the user to guide the synthesis. TOWARDS DYNAMIC RANDOMIZED ALGORITHMS IN COMPUTATIONAL GEOMETRY Ph.D. Thesis - Paris-Sud Univ., 10 Dec. 1991

Monique Teillaud Jul. 1992 180 p Sponsored by EEC

(INRIA-RR-1727; ETN-93-94432) Avail: CASI HC A09/MF A02

Computational geometry aims to design and analyze algorithms for solving geometric problems. Randomization allows the use of complicated data structures to be avoided, and was proved to be very efficient, from both points of view of theoretical complexity and practical results. Particular interest is shown in designing dynamic algorithms: in practice, the data of a problem are often acquired progressively. It is obviously not reasonable to compute the whole result again each time a new data is inserted, (semi)dynamic schemes are thus necessary. A very general data structure, the Influence Graph, is introduced, that allows the construction of various geometric structures: Voronoi diagrams, arrangements of line segments, etc. Both theoretical complexity and practical efficiency of the algorithms are studied. TDNOVA INTERACTIVE GRAPHICS Interim Report, Jan. 1990 - Dec. 1992

Ronald D. Anderson Jul. 1993 34 p Limited Reproducibility: More than 20% of this document may be affected by poor print and microfiche quality

(DA Proj. 1L1-61102-AH-43)

(AD-A268000; ARL-TR-165) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

As computational resources have expanded, the computer codes have kept pace with increased complexity and have grown in sheer volume of output-so much that the millions of numbers are difficult to comprehend without a visualizing tool. A graphical analysis program has been developed to view the huge amount of data produced by the two-dimensional (2-D) NOVA interior ballistics code (TDNOVA). By using color plots and drawings, the TDNOVA Graphical Analysis Program (TGAP) can display 2-D and 3-D information in four separate, independent windows. Besides the standard interior ballistic (IB) data, such as pressure, temperature, and gas velocity, the TGAP program can also show deformation of the computational grid, movement of propellant increments, and composite gas velocity vectors (radial and axial directions). Three-dimensional drawings of computed IB physical quantities can be rotated, shifted, and sized to produce the desired view for the scientist. Any of the four windows may be chosen for enlargement to full-screen size to make color screen copies or viewgraphs. The windows may show four different types of data from a single TDNOVA calculation, or may be used to display data from up to four completely independent computations. DTIC

A PROTOCOL VALIDATOR FOR THE SCM AND CFSM MODELS M.S. Thesis

Zeki B. Bulbul Jun. 1993 141 p

(AD-A268523) Avail: CASI HC A07/MF A02

This thesis introduces and describes a software tool called Mushroom which automates the analysis of network protocols specified by the Systems of Communicating Machines (SCM) and the Communicating Finite State Machines (CFSM) models. SCM is a formal model for the specification, verification, and testing of communication protocols. This model was originally developed to improve the CFSM model which is a simpler and earlier Formal Description Technique (FDT). The program is developed as two separate programs in the Ada programming language. The first program automates either the system state analysis (Smart Mushroom), or the full global analysis (Big Mushroom) for a protocol specified by the SCM model. The second program called Simple Mushroom, automates the global reachability analysis for the CFSM model. Mushroom greatly facilitates the use of these models for protocol design and analysis. The run time and memory efficiency of a previous program was improved to allow the analysis of larger and more complex protocols. The program was also extended to accept up to eight machines (processes) in the protocol specification. The user interface of the program has also been improved. Mushroom has been used to verify some well known protocols specified by the SCM and CFSM models such as the token bus protocol, Go Back N and Lap-B data link control protocol. DTIC

A SOFTWARE PROCESS FRAMEWORK FOR THE SEI CAPABILITY MATURITY MODEL: REPEATABLE LEVEL Final Report

Timothy G. Olson, L. P. Gates, J. L. Mullaney, J. W. Over, and N. R. Reizer Jun. 1993 305 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract F19628-90-C-0003)

(AD-A268059) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This document describes a Software Process Framework (SPF) based on the Software Engineering Institute's (SEI) Capability Maturity Model (CMM) for the Repeatable Level (Level 2). The purpose of the SPF is to provide guidance for designing, analyzing, and reviewing software processes (consisting of standards, processes, procedures, training, and tools) so that they are consistent with the CMM. As a thesaurus is a companion book to a dictionary (both are useful for different purposes) the SPF is a companion guide to the CMM for defining software processes. For each key process area in the CMM, the SPF defines roles, entry and exit criteria, inputs and outputs, activities, reviews and audits, measurements, etc. This information can also be used to help build process models and process guides that are consistent with the CMM. The primary audiences of the SPF are software engineering process groups (SEPG's), process engineers, process action teams, and software quality assurance groups. Secondary audiences include anyone interested in software process improvement, or anyone using the CMM. DTIC

X RAY COMPUTED TOMOGRAPHY FOR GEOMETRY ACQUISITION Interim Report, May 1991 - Feb. 1992

Alan R. Crews, Richard H. Bossi, and Gary E. Georgeson 1 Mar. 1993 22 p

(Contract F33615-88-C-5404)

(AD-A268085; WL-TR-93-4036) Avail: CASI HC A03/MF A01

X-ray computed tomography (CT) provides quantitative measures of component feature dimensions and density as related to the linear X-ray attenuation of the material under study. The data are available in digital format to be input not only to NDE workstations but also design workstations. By converting the CT data to computer aided design/engineering (CAD/E) workstations, the designer/engineer can access the as-built component geometry. Productivity gains are realized in generating computer drawings for as-built components. In the case of components that do not have adequate drawing documentation, particularly ergonomically, aesthetically or aerodynamically shaped parts, the CT data provide a highly cost effective approach for generating digital format documentation. Multiple slice CT data may be used to completely define the object, or CT data at selected orientations may be used to define specific features. Once data are transferred to a workstation, the designer can manipulate the data to create a part drawing. The process of obtaining digital definition of an existing component is referred to as geometry acquisition. DTIC

RESEARCH IN PRESISTENT SIMULATION: DEVELOPMENT OF THE PERSISTENT ModSim OBJECT-ORIENTED PROGRAMMING LANGUAGE Interim Report

Charles Herring, Biju Kalathil, and Joseph Teo Jul. 1993 52 p

(DA Proj. 4A1-62784-AT-41)

(AD-A268568; CERL-IR-FF-93/07) Avail: CASI HC A04/MF A01

A general trend in object-oriented programming language development is the addition of features for consistent storage of objects. This capability is implemented through persistent programming languages and object-oriented databases. The U.S. Army Construction Engineering Research Laboratories has developed Persistent ModSim, an enhanced version of the ModSim programming language previously developed to provide a general-purpose, object-oriented, process-based simulation language with support for programming large-scale simulations. This report describes the pilot and prototype experiments leading to the development of a robust version of Persistent ModSim. Details of the database class libraries, transient and persistent object allocation, transactions, and compilation management are given. Example programs are provided to show how Persistent Modsim's facilities are used. Directions for future research in this area are outlined. DTIC

THE DEVELOPMENT OF FLEXIBLE SOFTWARE FOR THE ITALIAN/DUTCH SATELLITE SAX: ADVANTAGES AND DISADVANTAGES OF THE USE OF CASE TOOLS

G. J. Dekker and G. J. Hameetman 29 Jul. 1991 13 p Presented at AIAA Computing on Aerospace 8 Conference, Baltimore, MD, 21-24 Oct. 1991 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract FSS-SAX-90/005-NL/TS)

(NLR-TP-91288-U; ETN-93-94780) Avail: CASI HC A03

The application software is described in relation with the overall SAX (Italian acronym for X-ray Astronomy Satellite) Attitude and Orbit Control Subsystem (AOCS). The ACOS onboard application software is being developed using a suite of CASE (Computer Aided Systems Engineering) tools, the CASE software configuration management package, processor emulation hardware and software, and a number of special test and simulation tools. The CASE tools that were used during the development, the advantages and disadvantages of the use of these tools, the measures taken to meet the more or less conflicting requirements of reliability and flexibility, and the lessons learned during development are described. On board software was also developed for other satellites but this was done without the help of commercial CASE tools. Both approaches, with and without CASE tools, are compared. The current status of the software is that it is being coded and module tested. ESA

A wide variety of physical phenomena can be modeled with particles. Such simulations pose interesting challenges for parallel machines since the computations are often difficult to load-balance and can require irregular

communication. We discuss the size of problems that can be simulated today, obstacles to higher performance, and areas where algorithmic improvements are needed. The relevant issues are illustrated with two prototypical simulations: a Monte Carlo model of low-density fluid flow and molecular dynamics. DOE

When a data-parallel language like FORTRAN 90 is compiled for a distributed-memory machine, aggregate data objects (such as arrays) are distributed across the processor memories. The mapping determines the amount of residual communication needed to bring operands of parallel operations into alignment with each other. A common approach is to break the mapping into two stages: first, an alignment that maps all the objects to an abstract template, and then a distribution that maps the template to the processors. We solve two facets of the problem of finding alignments that reduce residual communication: we determine alignments that vary in loops, and objects that should have replicated alignments. We show that loop-dependent mobile alignment is sometimes necessary for optimum performance, and we provide algorithms with which a compiler can determine good mobile alignments for objects within do loops. We also identify situations in which replicated alignment is either required by the program itself (via spread operations) or can be used to improve performance. We propose an algorithm based on network flow that determines which objects to replicate so as to minimize the total amount of broadcast communication in replication. This work on mobile and replicated alignment extends our earlier work on determining static alignment. Author

THE APPLICATION OF COMPILER-ASSISTED MULTIPLE INSTRUCTION RETRY TO VLIW ARCHITECTURES

Shyh-Kwei Chen, W. K. Fuchs, and Wen-Mei W. Hwu 1993 19 p

(Contract N00014-91-J-1128)

(AD-A266930) Avail: CASI HC A03/MF A01

Very Long Instruction Word (VLIW) architectures enhance performance by exploiting fine instruction level parallelism. The development of two compiler assisted multiple instruction word retry schemes for VLIW architectures are described. The first scheme utilizes the compiler techniques previously developed for processors with single functional units. Compiler generated hazard-free code with different degrees of rollback capability for uni-processors is compacted by a modified VLIW trace scheduling algorithm. Nops are then inserted in the scheduled code words to resolve data hazards for VLIW architectures. Performance is compared under three parameters: N, the rollback distance for uni-processors; P, the number of functional units; and n, the rollback distance for VLIW architectures. The second scheme employs a hardware read buffer to resolve frequently occurring data hazards, and utilizes the compiler to resolve the remaining hazards. Performance results are shown for six benchmark programs. DTIC

OVERVIEW OF ENHANCED DATA STREAM ARRAY PROCESSOR (EDSAP)

A. G. Rocco, P. D. Linton, and J. K. Noonan 6 May 1993 54 p

(Contract F19628-90-C-0002)

(AD-A266986; TR-974; TR-92-159) Avail: CASI HC A04/MF A01

The Enhanced Data Stream Array Processor (EDSAP) is a scalable version of the DSAP processing architecture that will allow massively parallel processing. Lincoln Laboratory previously designed two generations of DSAP processors; these programmable signal/data processors provide very high throughput in small, lightweight packages that require low power use. The EDSAP design builds upon the DSAP architecture in a way that provides for processing in the gigaop (billion operations per second) to teraop (trillion operations per second) range. This capability is being accomplished primarily by a significant redesign of high-speed I/O and interprocessor communication. Other architectural improvements, as well as rapid technological advances, contribute to the improved processor. This report provides an overview of the architecture of the EDSAP. The first EDSAP board is expected to be available in late 1993. DTIC

AN ELEMENTARY TUTORIAL ON FORMAL SPECIFICATION AND VERIFICATION USING PVS

Ricky W. Butler Sep. 1993 71 p Sponsored by NASA, Washington

(RTOP 505-64-10-13)

(NASA-TM-108991; NAS 1.15:108991) Avail: CASI HC A04/MF A01

A tutorial on the development of a formal specification and its verification using the Prototype Verification System (PVS) is presented. The tutorial presents the formal specification and verification techniques by way of specific example - an airline reservation system. The airline reservation system is modeled as a simple state machine with two basic operations. These operations are shown to preserve a state invariant using the theorem proving capabilities of PVS. The technique of validating a specification via 'putative theorem proving' is also discussed and illustrated in detail. This paper is intended for the novice and assumes only some of the basic concepts of logic. A complete description of user inputs and the PVS output is provided and thus it can be effectively used while one is sitting at a computer terminal. Author (revised)

PROCESSOR CAPACITY RESERVES FOR MULTIMEDIA OPERATING SYSTEMS

Clifford W. Mercer, Stefan Savage, and Hideyuki Tokuda May 1993 17 p

(Contract N00014-91-J-4061)
(AD-A266639; CMU-CS-93-157) Avail: CASI HC A03/MF A01

Multimedia applications have timing requirements that cannot generally be satisfied using time-sharing scheduling algorithms and system structures. To effectively support these types of programs, operating systems must support processor capacity reservation. A capacity reservation and enforcement mechanism isolates programs from the timing and execution characteristics of other programs in the same way that a memory protection system isolates programs from memory access by other programs. In this paper, we characterize the timing requirements and processor capacity reservation requirements for multimedia applications, we describe a scheduling framework to support reservation and admission control, and we introduce a novel reserve abstraction, specifically designed for the microkernel architecture, for controlling processor usage. DECOMPOSITION OF LARGE SPARSE SYMMETRIC SYSTEMS FOR PARALLEL COMPUTATION. PART 1: THEORETICAL FOUNDATIONS Final Report
A. K. Kevorkian Mar. 1993 62 p
(AD-A267144; NRAD-TR-1572-Pt-1) Avail: CASI HC A04/MF A01

Given a sparse symmetric matrix M, we develop a linear-time algorithm to construct in the undirected graph G = (V, E) of M a vertex partition Π* = (V1, V2, ..., Vr, S*) satisfying the following three properties. First, for any two distinct elements Vi and Vj of the partition, no vertex in Vi is adjacent to a vertex in Vj. Second, every element Vi of the partition induces a clique in G. Third, if A is a full principal submatrix of M such that the symbolic factorization of A does not produce fill-in, then the set of vertices in G corresponding to the rows of A is a subset of an element Vi of the partition. By the first two properties of the vertex partition Π*, the solution of a sparse symmetric problem is reduced to the solution of smaller dense symmetric subproblems. In the case where M is a positive definite matrix, the first property allows us to factorize r dense symmetric blocks in parallel as well as solve in parallel r triangular systems with multiple right-hand sides. The third property is a means for computing an ordering that produces acceptably small fill-in. DTIC

GENERATING LOCAL ADDRESSES AND COMMUNICATION SETS FOR DATA-PARALLEL PROGRAMS
Siddhartha Chatterjee, John R. Gilbert, Fred J. E. Long, Robert Schreiber, and Shang-Hua Teng Apr. 1993 11 p Presented at the Fourth ACM SIGPLAN Symposium on Principles and Practice of Parallel Programming, San Diego, CA, May 1993 See also A93-51951
(Contract NCC2-387)
(NASA-CR-194605; RIACS-TR-93.03; NAS 1.26:194605) Avail: CASI HC A03/MF A01

Generating local addresses and communication sets is an important issue in distributed-memory implementations of data-parallel languages such as High Performance Fortran. We show that for an array A affinely aligned to a template that is distributed across p processors with a cyclic(k) distribution, and a computation involving the regular section A, the local memory access sequence for any processor is characterized by a finite state machine of at most k states. We present fast algorithms for computing the essential information about these state machines, and extend the framework to handle multidimensional arrays. We also show how to generate communication sets using the state machine approach. Performance results show that this solution requires very little runtime overhead and acceptable preprocessing time. Even though today supercomputers are routinely used by large industrial corporations, parallel processors are thought of as exotic machines. Currently, only a fraction of the engineering community is engaged in applying the concurrent computation technology. Incorporation of these new machines in the mainstream of large scale computations is more challenging than that of supercomputers, and will have a greater impact on computational engineering power. Moving engineering applications to concurrent processors faces significant obstacles that will have to be resolved as such machines are becoming available on a commercial scale. These obstacles center on: (1) methods, (2) algorithms, and (3) software. The present proposal addresses all of these issues. 3ore specifically, the objectives of this research are: (1) to investigate, (2) implement, and (3) evaluate tools for concurrent processing of very large structural engineering problems. A TRACE-BASED COMPARISON OF SHARED MEMORY MULTIPROCESSOR ARCHITECTURES
William J. Bolosky and Michael L. Scott Jul. 1992 29 p
(Grant NSF CDA-88-22724)
(TR-432) Avail: CASI HC A03/MF A01

There are three major classes of MIMD multiprocessors: cache-coherent machines, NUMA (non-uniform memory reference) machines without cache coherence, and distributed memory multicomputers. All three classes can be used to run shared-memory applications, though the third requires software support in order to do so, and the second requires software support in order to do so well. We use trace-driven simulation to compare the performance of these classes, in an attempt to determine the effact of various architectural features and parameters on overall program performance. For those systems whose hardware or software supports both coherent caching (migration, replication) and remote reference, we use optimal off-line analysis to make the correct decision in all cases. This technique allows us to evaluate architectural alternatives without worrying that the results may be biased by a poor data placement policy. We find that the size of the unit of coherence (page or cache line) is the dominant factor in performance; that NUMA systems can have performance comparable to that of cache coherent machines; and that even relatively expensive, software-implemented remote reference is beneficial in distributed shared memory machines. SHARED-MEMORY MULTIPROCESSOR TRENDS AND THE IMPLICATIONS FOR PARALLEL PROGRAM PERFORMANCE
Evangelos P. Markatos and Thomas J. LeBlanc May 1992 30 p
(Grants NSF CDA-88-22724; NSF CCR-90-05633)
(TR-420) Avail: CASI HC A03/MF A01

The last decade has produced enormous improvements in processor speeds without a corresponding improvement in bus or interconnection network speeds. As a result, the relative costs of communication and computation in shared-memory multiprocessors have changed dramatically. An important consequence of this trend is that many parallel applications, which depend on a delicate balance between the cost of communication and computation, do not execute efficiently on today's shared-memory multiprocessors. We quantify the effect of this trend in multiprocessor architecture on parallel program performance. Our experiments on bus-based, cache-coherent machines like the Sequent Symmetry, and large-scale distributed-memory machines like the BBN Butterfly, demonstrate that applications scale much better on previous-generation machines than on current machines. In addition, we show that some scalable machines support fine-grain, shared-memory programs better than some bus-based, cache-coherent machines, without significantly greater programming effort. From our experiments we conclude that communication has become a dominant source of inefficiency in shared-memory multiprocessors, with

serious consequences for system software involved in scheduling and decomposition decisions. In particular, we argue that shared-memory programming models that could be implemented efficiently on the machines of yesterday do not readily port to state-of-the-art machines, and that current software trends in support of fine-grain parallel programming are at odds with hardware trends. EFFICIENT COMPILATION OF ARRAY STATEMENTS FOR PRIVATE MEMORY MULTICOMPUTERS

James M. Stichnoth Feb. 1993 54 p

(Contract MDA972-90-C-0035; ARPA Order 7330)

(AD-A266595; CMU-CS-93-109) Avail: CASI HC A04/MF A01

One of the core constructs of High Performance Fortran (HPF) is the array-slice assignment statement combined with the rich choice of data distribution options available to the programmer. On a private memory multicomputer, the HPF compiler writer faces the difficult task of automatically generating the necessary communication for assignment statements involving arrays with arbitrary block-cyclic data distributions. In this paper we present a framework for representing array slices and block-cyclic distributions, and we derive efficient algorithms for sending and receiving the necessary data for array-slice assignment statements. The algorithms include a memory-efficient method of managing the layout of the distributed arrays in each processor's local memory. We also provide a means of converting the user's TEMPLATE, ALIGN, and DISTRIBUTE statements into a convenient array ownership descriptor. In addition, we present several optimizations for common distributions and easily-recognized communication patterns. The work presented makes minimal assumptions regarding the processor architecture, the communication architecture, or the underlying language being compiled. DTIC

ASYNCHRONOUS DESIGN FOR PARALLEL PROCESSING ARCHITECTURES Final Report

Teresa H.-Y. Meng Jun. 1993 5 p

(Contract N00014-89-J-3036)

(AD-A266523) Avail: CASI HC A01/MF A01

As the integration of VLSI systems becomes larger and denser, implementing a high-performance parallel architecture using a global clock is becoming more inefficient and difficult to design, primarily due to concerns related to clock skew and data synchronization. To solve this problem, a large system may be broken up into asynchronously communicating processors. Each processor can be either asynchronous or synchronous and therefore execute at a rate best suited for individual tasks. Using such asynchronous communication provides a modular design environment in which processors can be individually optimized to yield prominent performance improvement. However the advantages of asynchronous design do not come without a cost, due to two-way communication and design restrictions necessary to avoid hazards and races. In addition, adopting an asynchronous design style requires new methods for synthesis and verification. This research work addressed these methods to simplify the design methodology for asynchronous processors and improve their performance. To provide similar easy-to-use synthesis tools for the design of asynchronous systems, as are available and widely used in the design of synchronous systems, we have developed CAD tools that allow automated design of synchronous, asynchronous, and mixed synchronous/asynchronous circuits. Our work can be summarized in three major topics: automated gate-level synthesis of asynchronous circuits, a uniform approach to both synchronous and asynchronous circuit synthesis, and efficient verification. A COMPARISON OF QUEUEING, CLUSTER AND DISTRIBUTED COMPUTING SYSTEMS

Joseph A. Kaplan and Michael L. Nelson Oct. 1993 49 p

(RTOP 505-90-53-02)

(NASA-TM-109025; NAS 1.15:109025) Avail: CASI HC A03/MF A01

Using workstation clusters for distributed computing has become popular with the proliferation of inexpensive, powerful workstations. Workstation clusters offer both a cost effective alternative to batch processing and an easy entry into parallel computing. However, a number of workstations on a network does not constitute a cluster. Cluster management software is necessary to harness the collective computing power. A variety of cluster management and queuing systems are compared: Distributed Queueing Systems (DQS), Condor, Load Leveler, Load Balancer, Load Sharing Facility (LSF - formerly Utopia), Distributed Job Manager (DJM), Computing in Distributed Networked Environments (CODINE), and NQS/Exec. The systems differ in their design philosophy and implementation. Based on published reports on the different systems and conversations with the system's developers and vendors, a comparison of the systems are made on the integral issues of clustered computing. EMBEDDED COMPUTER SYSTEMS: STATUS OF C-17 SOFTWARE

18 Mar. 1993 6 p

(AD-A267307; GAO/T-IMTEC-93-2) Avail: CASI HC A02/MF A01

The C-17 will be the most computerized, software-intensive, transport aircraft ever built. Embedded computers are essential for the C-17 to accomplish its mission; the aircraft depends on these computers to control basic avionics functions such as flight control, communication, and instrument displays. The C-17 relies on 19 different types of embedded computers incorporating over 80 microprocessors and about 1.3 million lines of code. This statement provides information on the current status of embedded computer and software development for the C-17. In summary, we have observed a pattern of the Air Force continuing to permit its prime contractor, McDonnell Douglas Corporation, to defer software development to future aircraft. Originally, the first aircraft (T-1), delivered in September 1991, was supposed to include all the software. But, McDonnell was unable to develop and deliver the software on time. Rather than slowing aircraft production until the software could be completed, McDonnell deferred software development, initially to the P-2 aircraft, then to the P-5 aircraft, and now to the P-6 and future aircraft. Each software development deferral further delays the Air Force's ability to fully test the software and demonstrate that the C-17 can meet all of its requirements. DTIC

NETWORKED WORKSTATIONS AND PARALLEL PROCESSING UTILIZING FUNCTIONAL LANGUAGES M.S. Thesis

Stanley L. Fox, II Mar. 1993 124 p

(AD-A267464) Avail: CASI HC A06/MF A02

Alternative computer architectures are necessary to replace the traditional 'von Neumann' computer organization in order to obtain large increases in performance. The traditional 'von Neumann' architecture uses a timer based (e.g., the program counter), sequentially programmed, single processor approach to problem solving. Today's new hardware technology allows for the utilization of multiple processors. By programming and operating these processors in parallel, this alternative architecture will provide for greater computing speed, improved system reliability, enhanced software manageability, and a more cost-effective approach than our present computing practices. CALS TEST NETWORK HANDBOOK

Mar. 1993 77 p

(AD-A267587) Avail: CASI HC A05/MF A01

This Computer-aided Acquisition and Logistic Support (CALS) Test Network (CTN) Handbook will have periodic updates. These will occur as

the technology of CALS standards and testing grows and matures. CALS Standards and Specifications require three levels of testing. The testing includes the following: (1) Standards Validation Testing; (2) Conformance Testing; and (3) User Application Testing. The management of CALS Standards Validation Testing and user Application Testing has been assigned to the CALS Test Network. Conformance Testing wil be assigned to other agencies. The purpose of this handbook is twofold. First, it provides an introduction to the CTN and identifies the managers and testing analysts. Second, it lists CTN reference material such as testing platforms used by CTN, testing tools, CTN reference test packet descriptions, and how to receive some of these materials. The writing style and format of the document is concise. DTIC

ISIS is a toolkit for building applications consisting of cooperating processes in a distributed system. Group management and group communication are two basic building blocks provided by ISIS. This approach has proven successful, and ISIS' large user community is putting substantial demands on these mechanisms. To accommodate these demands a complete redesign of the system, called HORUS, is being done to build a simpler and faster system that scales well. Of particular concern is the support and management of hundreds of thousands or more process groups. This paper describes a component of HORUS known as light-weight process groups that addresses this scaling issue. DTIC

NON-BLOCKING CROSSBAR PERMUTATION ENGINE WITH CONSTANT ROUTING LATENCY Patent Application
Steve P. Monacos, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) 18 Aug. 1993 60 p
(Contract NAS7-918)
(NASA-Case-NPO-18864-1-CU; NAS 1.71:NPO-18864-1-CU; US-Patent-Appl-SN-111318) Avail: CASI HC A04/MF A01

The invention is embodied in an N x N crossbar for routing packets from a set of N input ports to a set of N output ports, each packet having a header identifying one of the output ports as its destination, including a plurality of individual links which carry individual packets. Each link has a link input end and a link output end, a plurality of switches. Each of the switches has at least top and bottom switch inputs connected to a corresponding pair of the link output ends and top and bottom switch outputs connected to a corresponding pair of link input ends, whereby each switch is connected to four different links. Each of the switches has an exchange state which routes packets from the top and bottom switch inputs to the bottom and top switch outputs, respectively, and a bypass state which routes packets from the top and bottom switch inputs to the top and bottom switch outputs, respectively. A plurality of individual controller devices governing respective switches for sensing from a header of a packet at each switch input for the identity of the destination output port of the packet and selecting one of the exchange and bypass states in accordance with the identity of the destination output port and with the location of the corresponding switch relative to the destination output port. ESTIMATING TASK EXECUTION DELAY IN A REAL-TIME SYSTEM VIA STATIC SOURCE CODE ANALYSIS M.S. Thesis
Steve B. Treadwell Jun. 1993 125 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A267496; AFIT/CI/CIA-93-072) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

In a hard-real-time system, it is critical that application tasks complete their iterative execution cycles within their allotted time frames. For a highly configurable parallel processing system, there exists an overwhelming set of hardware and software configurations, and it is useful to know a priori if a particular configuration satisfies hard-real-time constraints. This thesis presents an automated timing analysis tool which attempts to accurately characterize the timing behavior of the C3 Fault-Tolerant Parallel Processor (FTPP) developed at the Charles Stark Draper Laboratory. For each application task hosted by the FTPP, this automated tool performs a static source code analysis in an effort to estimate a lower bound on worst case execution delay. Then, using the specified mapping between software tasks and hardware processing sites, the analysis tool integrates the results of the individual task analyses in an effort to account for delays due to operating system overhead. The final portion of the analysis involves a prediction of possible performance failures based upon the given system configuration and the timing deadlines imposed by the FTPP's rate group scheduling paradigm. It is intended that the results of this timing analysis will help the user to develop a system configuration that optimizes throughput while minimizing the risk, of performance failures. DTIC

ISOCHRONETS: A HIGH-SPEED NETWORK SWITCHING ARCHITECTURE
Yechiam Yemini and Danilo Florissi 1992 8 p
(Grant NSF NCR-91-01627)
(AD-A267811; CUCS-050-92) Avail: CASI HC A02/MF A01

This paper overviews a novel switching architecture for high-speed networks: Isochronets. Isochronets time-divide network bandwidth among routing trees. Traffic moves down a routing tree to the root during its time band. Network functions such as routing and flow control are entirely governed by band timers and require no processing of frame headers bits. Frame motions need not be delayed for switch processing allowing Isochronets to scale over a large spectrum of transmission speeds and support all-optical implementations. The network functions as a media-access layer that can support multiple framing protocols simultaneously, handled by higher layers at the periphery. Internetworking is reduced to a simple media-layer bridging. Isochronets provide flexible quality of service control and multicasting through allocation of bands to routing trees. They can be tuned to span a spectrum of performance behaviors outperforming both circuit or packet switching. DTIC

VERIFICATION OF FAULT-TOLERANT CLOCK SYNCHRONIZATION SYSTEMS M.S. Thesis - College of William and Mary, 1992
Paul S. Miner Nov. 1993 143 p
(RTOP 505-64-50-03)
(NASA-TP-3349; L-17209; NAS 1.60:3349) Avail: CASI HC A07/MF A02

A critical function in a fault-tolerant computer architecture is the synchronization of the redundant computing elements. The synchronization algorithm must include safeguards to ensure that failed components do not corrupt the behavior of good clocks. Reasoning about fault-tolerant clock synchronization is difficult because of the possibility of subtle interactions involving failed components. Therefore, mechanical proof systems are used to ensure that the verification of the synchronization system is correct. In 1987, Schneider presented a general proof of correctness for several fault-tolerant clock synchronization algorithms.

Subsequently, Shankar verified Schneider's proof by using the mechanical proof system EHDM. This proof ensures that any system satisfying its underlying assumptions will provide Byzantine fault-tolerant clock synchronization. The utility of Shankar's mechanization of Schneider's theory for the verification of clock synchronization systems is explored. Some limitations of Shankar's mechanically verified theory were encountered. With minor modifications to the theory, a mechanically checked proof is provided that removes these limitations. The revised theory also allows for proven recovery from transient faults. Use of the revised theory is illustrated with the verification of an abstract design of a clock synchronization system.

STOCHASTIC SCHEDULING IN A MULTICLASS G/G/1 QUEUE
Philippe Nain and Don Towsley (Massachusetts Univ., Amherst.) Sep. 1992 14 p
(Grants NSF ASC-88-02764; NSF NCR-91-16183)
(INRIA-RR-1746; ETN-93-94437) Avail: CASI HC A03/MF A01

The problem of scheduling customers in a multiclass G/G/1 queue so as to minimize a weighted sum of the workloads of the different classes is addressed. The nonidling, preemptive, fixed priority policy that schedules customers belonging to the class having the maximum weight is established as minimizing the cost function pathwise at any point in time. This result is based on the application of elementary forward induction arguments and is shown to hold for a very general class of policies. A proof for the optimality of the mu-c rule in the multiclass G/M/1 queue is then obtained as an easy corollary of the first result.

ACCURATE ANALYSIS OF ARRAY REFERENCES M.S. Thesis
Dror E. Maydan 22 Sep. 1992 144 p
(Contract N00039-91-C-0138)
(AD-A268069; STAN-CS-92-1449; CSL-TR-92-547) Avail: CASI HC A07/MF A02

This thesis addresses the problem of data dependence analysis, the base step in detecting loop level parallelism in scientific programs. Traditional data dependence analysis research has concentrated on the simpler problem of affine memory disambiguation. Many algorithms have been developed that conservatively approximate even this simpler problem. Using a series of algorithms, each one guaranteed to be exact for a certain class of input, we are able to devise a new method that in practice solves exactly and efficiently the affine memory disambiguation problem. Because our system is exact, we can devise an experiment to test the effectiveness of affine memory disambiguation at approximating the full dependence problem. We discover that the lack of dataflow information on array elements is the key limitation of affine memory disambiguators. We develop a new representation and algorithm to efficiently calculate these data-flow dependences. Finally, we address the problem of interprocedural data dependence analysis. By using an array summary representation that is guaranteed to be exact when applicable, we can combine summaries with inlining to exactly and efficiently analyze affine array references across procedure boundaries. Taken together, our algorithms generate the more accurate information that will be needed to exploit parallelism in the future.

SYSTEM PERFORMANCE MODELING AND ANALYSIS OF A FAULT-TOLERANT, REAL TIME PARALLEL PROCESSOR M.S. Thesis
Robert J. Clasen 27 May 1993 142 p
(AD-A268070; AFIT/CI/CIA-93-112) Avail: CASI HC A07/MF A02

The use of fault-tolerant, real-time systems for the control of life-critical processes is becoming increasingly common, with examples including flight and nuclear reactor control systems. In such systems, the overhead associated with managing redundancy, communication, and task scheduling is critical due to real-time constraints imposed by the application; missed time deadlines can be viewed as system failures, with results as consequential as hardware failures. The Fault-Tolerant Parallel Processor (FTPP) was developed by Draper Laboratory as a fault-tolerant, real-time computing platform. This thesis analyzes the FTPP prototype operating system overhead through the use of empirical performance measurement and two performance models based on these measurements. One model is developed to predict the operating system overhead under various configurations and workloads; accurate prediction of overhead provides confidence that real-time constraints can be satisfied. Because the system communication overhead may vary depending upon the amount of contention by Processing Elements for service by the Network Element, a second model is developed to account for performance delays that may result from this contention. When such performance analysis and modeling are an integral part of a concurrent build-analyze-improve methodology, performance bottlenecks can be cost effectively removed at an early stage in development.

AN INTERNETWORK AUTHENTICATION ARCHITECTURE
Randall J. Atkinson 5 Aug. 1993 15 p
(AD-A268579; NRL/FR/5544-93-9561) Avail: CASI HC A03/MF A01

Current internetworks do not have effective host-to-host authentication mechanisms. The lack of these mechanisms contributes substantially to currently widespread network security problems. Public key authentication is a good approach to providing optional authentication in internetworks. An internetwork authentication architecture using public key authentication technology is proposed as a possible mechanism to substantially improve the security of large internetworks. Limitations of the proposed authentication architecture are also described.

The purpose of this paper is to summarize some initial experiences related to measuring the performance of massively parallel processors (MPP's) at Los Alamos National Laboratory (LANL). Actually, the range of MPP architectures the authors have used is rather limited, being confined mostly to the Thinking Machines Corporation (TMC) Connection Machine CM-2 and CM-5. Some very preliminary work has been carried out on the Kendall Square KSR-1, and efforts related to other machines, such as the Intel Paragon and the soon-to-be-released CRAY T3D are planned. This paper will concentrate more on methodology rather than discuss specific architectural strengths and weaknesses; the latter is expected to be the subject of future reports. MPP benchmarking is a field in critical need of structure and definition. As the authors have stated previously, such machines have enormous potential, and there is certainly a dire need for orders of magnitude computational power over current supercomputers. However, performance reports for MPP's must emphasize actual sustainable performance from real applications in a careful, responsible manner. Such has not always been the case. A recent paper has described in some detail, the problem of potentially misleading performance reporting in the parallel scientific computing field. Thus, in this paper, the authors briefly offer a few general ideas on MPP performance analysis.

YARF: AN OPEN-ENDED FRAMEWORK FOR ROBOT ROAD FOLLOWING Ph.D. Thesis
Karl Kluge 24 Feb. 1993 98 p
(AD-A266788; CMU-CS-93-104) Avail: CASI HC A05/MF A02

This thesis describes YARF (Yet Another Road Follower), a vision-based system for autonomous road following. Video data from a camera mounted *on a robot vehicle is fed into a computer, which analyzes the image data* to locate the position of the vehicle relative to the road. The computer then issues command to actuators attached to the throttle, brakes, and steering in order to drive the vehicle along the road. YARF has been extensively tested using a combination of open- and closed-loop runs on testbed vehicles, simulation, and data from videotapes. YARF provides a set of perception capabilities to locate the position of the vehicle relative to the road, to detect changes in the lane structure of the road, to navigate through intersections given a model of the intersection geometry, and to extract the lane structure of the road without a prior model. The central theme of YARF is that using richer models improves road following performance. Models of geometric structure, of road appearance, and of segmentation performance all simplify processing and contribute to improve reliability. YARF uses road models in several ways: Model drive segmentation; Exploitation of model coherence to avoid the influence of contaminating data; and Data driven recognition of model changes. While YARF assumes that the models of road structure used are generated off line, the thesis presents an algorithm designed to automatically extract much of the needed model information. The algorithm uses a weak domain model to filter a noisy image segmentation, extracting both feature geometry and type.

Over the last several years, a number of sophisticated robot hands have been developed for laboratory use. However, while such hands approximate the mechanical complexity of human hands, their application in manipulation tasks remains in a primitive stage. Unlike human hands, they rely on minutely programmed task descriptions that are time-consuming to generate and susceptible to unanticipated changes in the task or the immediate environment. This is largely because they cannot use tactile information to detect and respond to changes in an event-driven fashion as humans do. Similarly, teleoperated manipulation systems are slow and difficult to use because the operator does not receive appropriate tactile feedback from the manipulator.

FUZZY CONTROL AND FUZZY KINEMATIC MAPPING FOR A REDUNDANT SPACE ROBOT
Alois Schacherbauer and Yangsheng Xu Aug. 1992 72 p
(AD-A266866; CMU-RI-TR-92-12) Avail: CASI HC A04/MF A01

Parts of the research in the Self Mobile Space Manipulator (SM2) project at Carnegie Mellon University are documented. Fuzzy Logic Friction Compensation schemes that improve motion performance of SM2 were developed. Both static and dynamic errors are reduced. Also, Fuzzy Inverse Kinematic Mapping is proposed to resolve the redundancy problem in SM2. The proposed scheme works identically for redundant and non-redundant robots, does not require any constraints to be imposed on the robot configuration, and provides a closed-form solution. This scheme in simulation is investigated and then implemented for real-time teleoperation of SM2.

FUZZY INVERSE KINEMATIC MAPPING: RULE GENERATION, EFFICIENCY, AND IMPLEMENTATION
Yangsheng Xu and Michael C. Nechyba Jan. 1993 34 p
(AD-A266967; CMU-RI-TR-93-02) Avail: CASI HC A03/MF A01

Inverse kinematics is computationally expensive and can result in significant control delays in real time. For a redundant robot, additional computations are required for the inverse kinematic solution through optimization schemes. Based on the fact that humans do not compute exact inverse kinematics, but can do precise positioning from heuristics, we developed an inverse kinematic mapping through fuzzy logic. The implementation of the proposed scheme has demonstrated that it is feasible for both redundant and nonredundant cases, and that it is very computationally efficient. The result provides sufficient precision, and transient tracking error can be controlled based on a fuzzy adaptive scheme proposed in this paper. This paper discusses the automatic generation of the Fuzzy Inverse Kinematic Mapping (FIKM) from specification of the Denavit-Hartenberg (DH) parameters, the efficiency of the scheme in comparison to conventional approaches, and the implementation results for both redundant and nonredundant robots.

SEGMENTING TEXTURED 3D SURFACES USING THE SPACE/FREQUENCY REPRESENTATION
John Krumm and Steven A. Shafer Apr. 1993 32 p
(AD-A266960; CMU-RI-TR-93-14) Avail: CASI HC A03/MF A01

Segmenting 3D textured surfaces is critical for general image understanding. Unfortunately, current efforts at automatically understanding image texture are based on assumptions that make this goal impossible. Texture segmentation research assumes that the textures are flat and viewed from the front, while shape-from-texture work assumes that the textures have already been segmented. This deadlock means that none of these algorithms can be successfully applied to images of 3D textured surfaces. We have developed an algorithm that can segment an image containing nonfrontally viewed, planar, periodic textures. We use the spectrogram to compute local surface normals from many different regions of the image. This algorithm does not require unreliable image feature detection. Based on these surface normals, we compute a 'frontalized' version of the local power spectrum which shows what the region's power spectrum would look like if viewed from the front. If neighboring regions have similar frontalized power spectra, they are merged. To our knowledge, this is the first program that can segment 3D textured surfaces by explicitly accounting for shape effects.

HIDDEN MARKOV MODEL APPROACH TO SKILL LEARNING AND ITS APPLICATION TO TELEROBOTICS
Jie Yang, Yangsheng Xu, and C. S. Chen Jan. 1993 32 p
(AD-A266989; CMU/RI-TR-93-01) Avail: CASI HC A03/MF A01

In this paper, we discuss the problem of how human skill can be represented as a parametric model using a hidden Markov model (HMM), and how a HMM-based skill model can be used to learn human skill. HMM is feasible to characterize two stochastic processes--measurable action and immeasurable mental states--which are involved in the skill learning. We formulated the learning problem as a multi-dimensional HMM and developed a programming system which serves as a skill learning testbed for a variety of applications. Based on 'the most likely performance' criterion, we can select the best action sequence from all previously measured action data by modeling the skill as HMM. This selection process can be updated in real-time by feeding new action data and modifying HMM parameters. We address the implementation of the proposed method in a teleoperation-controlled space robot. An operator specifies the control command by a hand controller for the task of exchanging Orbit Replaceable Unit, and the robot learns the operation skill by selecting the sequence which represents the most likely performance of the operator. The skill is learned in Cartesian space, joint space, and velocity domain. The experimental results demonstrate the feasibility of the proposed method in learning human skill and teleoperation control. The learning is significant in eliminating sluggish motion and correcting the motion command which the operator mistakenly generates. DTIC

STOCHASTIC SCHEDULING IN IN-FOREST NETWORKS
Zhen Liu and Don Towsley (Massachusetts Univ., Amherst.) Jul. 1992 36 p
(Grant NSF ASC-88-02764)
(INRIA-RR-1719; ETN-93-94430) Avail: CASI HC A03/MF A01

The extremal properties of several scheduling policies in a queueing network consisting of multiserver queues where the topology is that of an in-forest are studied. Associated with each customer is a due date. It is assumed that service times at the different queues form mutually independent sequences of independent and identically distributed random variables independent of the arrival times and due dates. Furthermore, the network is assumed to consist of a mixture of nodes, some of which only permit non-preemptive service policies whereas the others permit preemptive resume policies. In the case of nonpreemptive queues, service times may be generally distributed provided there is only one server; otherwise the service times are required to be increased in likelihood ratio. In the case of preemptive queues, service times are restricted to be exponentially distributed random variables. Using stochastic majorization and a partial order on permutations, it is established that, the class of work conserving service policies, the Smallest Due Date (SDD) and Largest Due Date (LDD) policies minimize and maximize, respectively, the vector of the customer latenesses of the first 'n' customers in the sense of the Schur-convex order. From this, it is concluded that the First Come First Serve (FCFS) and Last Come First Serve (LCFS) policies minimize and maximize, respectively, the vector of the response times of the first n customers in the sense of the Schur-convex order. If due dates are only known stochastically, then it is established that the stochastic SDD and the stochastic LDD policies minimize and maximize the vector of latenesses according to a weaker ordering. It is shown that the FCFS and LCFS policies minimize and maximize, respectively, the vector of customer end-to-end delays in the sense of the strong stochastic order. When idling policies are under consideration, the FCFS policy is shown to be optimal for various performance metrics in the case that all queues permit preemptive resume policies and all service times are exponentially distributed. Extensions of these results to the stationary regime are also given. ESA

STEERING CAPACIFLECTOR SENSOR Patent Application
Del T. Jenstrom, inventor (to NASA) and Robert L. McConnell, inventor (to NASA) (West Virginia Univ., Morgantown.) 23 Nov. 1992 15 p
(NASA-Case-GSC-13489-1; NAS 1.71:GSC-13489-1;
US-Patent-Appl-SN-979987) Avail: CASI HC A03/MF A01

A capacitive type proximity sensor having substantial range and sensitivity between a machine and an intruding object in the immediate vicinity of the machine and having a steerable sensing field has an outer electrical conductor on the machine forming one electrode of a sensor capacitor, the other electrode is the object. The outer conductor is a thin sheet of conductive material with a pair (or more) of intermediate electrical conductors located between the outer conductor and the machine. The pair of intermediate electrical conductors are in close proximity to each other and together form a surface having a size substantially larger than the outer conductor to act as a shield for reducing the parasitic capacitance between the outer conductor and the machine and to steer the sensor field. The pair of intermediate conductors are thin sheets of conductive material substantially wider than the first conductor. The outer and pair of intermediate conductors are attached to a surface on the machine in electrical isolation and with no gaps between the conductors and no gap between the surface and the pair of intermediate conductors. The outer and pair of intermediate conductors are also in conformance with each other and the surface of the machine, and the surface of the machine acts as a ground plane. Variable gain voltage follower circuits are used for coupling, in phase, the instantaneous voltage at the outer electrical conductor to the pair of intermediate electrical conductors and a signal generator is coupled to the outer conductor and is responsive to the capacitance of the sensor capacitor for generating a control signal to the machine. PIXEL-LEVEL FUSION USING INTEREST IMAGES
Richard L. Delanoy, Jacques G. Verly, and Dan E. Dudgeon 26 Apr. 1993 22 p
(Contract F19628-90-C-0002)
(AD-A266640; TR-979; ESC-TR-92-206) Avail: CASI HC A03/MF A01

A simple general-purpose means of representing image sensory data at the pixel level is presented in the context of target detection. One or more interest operators (i.e., feature detectors) are applied to one or more sensory images. The output of each operator is an interest image in which high pixel values are assigned to locations where features are found that are indicative of the object (or target) being sought. Any relevant sensory data that are transformed into interest images can then be fused in a pixel-wise manner by means as simple as computing averages, maxima or minima. The approach has been implemented in the detection module of an automatic target recognition system built at Lincoln Laboratory. DTIC

IMPENDING MOTION DIRECTION OF CONTACTING RIGID BODIES
David Baraff and Raju Mattikali Jun. 1993 19 p Limited Reproducibility: More than 20% of this document may be affected by poor print and microfiche quality
(AD-A266814; CMU-RI-TR-93-15) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Three different formulations are presented for expressing the initial motion direction of a system of contacting frictionless rigid bodies under gravity. The bodies are assumed to have no initial velocity. The first formulation expresses the accelerations of the bodies in terms of the contact forces between the bodies. The contact forces are themselves expressed as the solution to a quadratic programming problem. The second formulation expresses the accelerations of the bodies according to Gauss' principle of least constraint. This principle is well-known to apply to systems with holonomic motion constraints (such as joints or hinges); in this paper, we show that the principle extends to the nonholonomic constraints that arise due to contact between bodies. The third formulation is conceptually the simplest; it says simply that the initial acceleration of the system is in

the direction that most quickly decreases the gravitational potential energy of the system without violating the contact constraints between the bodies. DTIC

LOGARITHMIC ASYMPTOTICS FOR STEADY-STATE TAIL PROBABILITIES IN A SINGLE-SERVER QUEUE
Peter W. Glynn and Ward Whitt Jan. 1993 40 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DAAL03-91-G-0101)
(AD-A266746; ARO-28809.13-MA-SDI) Avail: CASI HC A03

We consider the standard single-server queue with unlimited waiting space and the first-out service discipline. We find conditions for the steady-state waiting-time distribution to have small-tail asymptotics of a certain form. We require only stationarity of the basic sequence of service times minus interarrival times and a Gaertner-Ellis condition for the cumulant generating function of the associated partial sums. DTIC

THE DESIGN AND ANALYSIS OF ROBUST FEEDBACK SYSTEMS Final Report, 1 Nov. 1989 - 31 Oct. 1992
Pramod P. Khargonekar 31 Oct. 1992 14 p
(Grant AF-AFOSR-0053-90)
(AD-A267152; AFOSR-93-0475TR) Avail: CASI HC A03/MF A01

In this report, we give a brief summary of the work done by the principal investigator and his students on the design and analysis of robust feedback systems. Under this contract, we have conducted research on a number of problems in robust control and identification theory. In particular, we have obtained significant new results on H2, H-infinity, and H2/H-infinity control theory, robust digital control in the framework of sampled-data systems, identification in H-infinity, etc. In this report, we will present a brief summary of the main results obtained under the AFOSR contract. AN EXPERIMENTAL COMPARISON OF CLOS AND C(++) IMPLEMENTATIONS OF AN OBJECT-ORIENTED GRAPHICAL SIMULATION OF WALKING ROBOT KINEMATICS M.S. Thesis
Sandra L. Davidson 25 Mar. 1993 146 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A267168) Avail: CASI HC A07

The ability to conduct research in the robotic field in new areas can be accomplished safely and efficiently using computer graphic simulation. Object-oriented languages provide a powerful and flexible capability in defining rigid body manipulators that can be adapted in the use and design of many types of systems. The very nature of object-oriented programming permits modification and improvement of the code with ease. The major capabilities of object-oriented programming in conjunction with kinematic equations that simulate a six-legged walking robot are examined. A comparison is conducted between programs using CLOS (LISP) and C++ to graphically simulate the Aquarobot - an existing underwater walking robot. It is found that both languages are effective, but CLOS programming is easier while C++ code executes more than twice as fast as compiled CLOS. DTIC

DOUBLE-DRIVEN SHIELD CAPACITIVE TYPE PROXIMITY SENSOR Patent Application
John M. Vranish, inventor (to NASA) 25 Jan. 1993 24 p
(NASA-Case-GSC-13541-1; NAS 1.71:GSC-13541-1;
US-Patent-Appl-SN-008426) Avail: CASI HC A03/MF A01

A capacity type proximity sensor comprised of a capacitance type sensor, a capacitance type reference, and two independent and mutually opposing driven shields respectively adjacent to the sensor and reference and which are coupled in an electrical bridge circuit configuration and driven by a single frequency crystal controlled oscillator is presented. The bridge circuit additionally includes a pair of fixed electrical impedance elements which form adjacent arms of the bridge and which comprise either a pair of precision resistances or capacitors. Detection of bridge unbalance provides an indication of the mutual proximity between an object and the sensor. Drift compensation is also utilized to improve performance and thus increase sensor range and sensitivity. NASA

UNIPOLAR TERMINAL-ATTRACTOR BASED NEURAL ASSOCIATIVE MEMORY WITH ADAPTIVE THRESHOLD Patent Application
Hua-Kuang Liu, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), Jacob Barhen, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), Nabil H. Farhat, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), and Chwan-Hwa Wu, inventor (to NASA) 7 Jun. 1993 66 p
(Contract NAS7-918)
(NASA-Case-NPO-18790-1-CU; NAS 1.71:NPO-18790-1-CU;
US-Patent-Appl-SN-073018) Avail: CASI HC A04/MF A01

A unipolar terminal-attractor based neural associative memory (TABAM) system with adaptive threshold for perfect convergence is presented. By adaptively setting the threshold values for the dynamic iteration for the unipolar binary neuron states with terminal-attractors for the purpose of reducing the spurious states in a Hopfield neural network for associative memory and using the inner product approach, perfect convergence and correct retrieval is achieved. Simulation is completed with a small number of stored states (M) and a small number of neurons (N) but a large M/N ratio. An experiment with optical exclusive-OR logic operation using LCTV SLMs shows the feasibility of optoelectronic implementation of the models. A complete inner-product TABAM is implemented using a PC for calculation of adaptive threshold values to achieve a unipolar TABAM (UIT) in the case where there is no crosstalk, and a crosstalk model (CRIT) in the case where crosstalk corrupts the desired state. CONTEXTUALLY DEPENDENT CONTROL STRATEGIES FOR MANIPULATION
Polly K. Pook and Dana H. Ballard Apr. 1992 27 p
(Grants NSF IRI-89-03582; NSF IRI-90-10692)
(TR-416) Avail: CASI HC A03/MF A01

Traditional analytic robotics defines grasping by knowing the task geometry and the forces acting on the manipulator precisely. This method is particularly important for non-compliant manipulators with few degrees of freedom, such as a parallel jaw gripper, that overconstrain the solution space. In contrast, the advent of anthropomorphic, high degree-of-freedom grippers allows us to use closed-loop strategies that depend heavily on the task context but do not require precise positioning knowledge. To demonstrate, a robotic hand flips a plastic egg, using the finger joint tendon tensions as the the sole control signal. The manipulator is a compliant, sixteen degree-of-freedom, Utah/MIT hand mounted on a Puma 760 arm. The completion of each subtask, such as picking up the spatula, finding the pan, and sliding the spatula under the egg, is detected by sensing when the tensions of the hand tendons pass a threshold. Beyond this use of tendon tensions and the approximate starting position of the spatula and pan, no model of the task is constructed. The routine is found to be robust to different spatulas and to changes in the location and

orientation of the spatula, egg, and table, with some exceptions. The egg-flipping example relies on interpreting fluctuating tension values within a known temporal sequence of actions. For instance, knowing when the manipulator is trying to touch the pan with the spatula provides the context to interpret changes in tendon tensions. Given the success of this task, we go on to propose a method for analyzing the temporal sensory output for tasks that have not been previously segmented. This method suggests a means for automatically generating robust force control programs to perform previously teleoperated manipulation tasks. Author (revised)

VISUALLY GUIDED TOUCHING AND MANUAL TRACKING
Peter A. Sandon Mar. 1992 35 p
(Grant NSF IRI-90-108999)
(TR-412) Avail: CASI HC A03/MF A01

Animate vision depends on an ability to choose a region of the visual environment for task-specific processing. This processing may involve extraction of image features for object classification or identification, or it may involve extraction of viewpoint parameters, such as position, scale and orientation, for guiding movement. It is the role of selective attention to choose the region to be processed in a task-dependent way. This paper describes a real-time implementation of a vision-robotics system that uses the location information provided by the attention mechanism to guide eye movements and arm movements in touching and manual tracking behaviors. TEMPORAL SEGMENTATION OF TASKS FROM HUMAN HAND MOTION Report, 1989 - 1993
Sing B. Kang and Katsushi Ikeuchi Apr. 1993 47 p
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A266596; CMU-CS-93-150) Avail: CASI HC A03/MF A01

This report describes work on the temporal segmentation of grasping task sequences based on human hand motion. The segmentation process results in the identification of motion breakpoints separating the different constituent phases of the grasping task. A grasping task is composed of three basic phases: pregrasp phase, static grasp phase, and manipulation phase. The pregrasp phase is the initial stage of the grasping task prior to the establishment of a stable grasp (static grasp phase) involved in the task. The manipulation phase refers to the purposeful hand-object interaction performed to achieve a goal in the task. In the pregrasp phase, the trajectory of the hand and the movement of the fingers follow an established pattern. Specifically, it comprises two parallel and simultaneous components: the hand transportation, and the hand preshape. We show that by analyzing the fingertip polygon area (which is an indication of the hand preshape) and the speed of hand movement (which is an indication of the hand transportation), we can divide a task into meaningful action segments such as approach object (which corresponds to the pregrasp phase), grasp object, manipulate object, place object, and depart (a special case of the pregrasp phase which signals the termination of the task). We introduce a measure called the volume sweep rate, which is the product of the fingertip polygon area and the hand speed. The profile of this measure is also used in the determination of the task breakpoints. DTIC

A MODULAR CONTROL ARCHITECTURE FOR REAL-TIME SYNCHRONOUS AND ASYNCHRONOUS SYSTEMS
P. L. Butler and J. P. Jones 1993 12 p Presented at the Society of Photo-Optical Instrumentation Engineers (SPIE) OE/Aerospace Science and Sensing Meeting, Orlando, FL, 11-16 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015439; CONF-930445-15) Avail: CASI HC A03/MF A01

This paper describes a control architecture for real-time control of complex robotic systems. The Modular Integrated Control Architecture (MICA), which is actually two complementary control systems, recognizes and exploits the differences between asynchronous and synchronous control. The asynchronous control system simulates shared memory on a heterogeneous network. For control information, a portable event-scheme is used. This scheme provides consistent interprocess coordination among multiple tasks on a number of distributed systems. The machines in the network can vary with respect to their native operating systems and the internal representation of numbers they use. The synchronous control system is needed for tight real-time control of complex electromechanical systems such as robot manipulators, and the system uses multiple processors at a specified rate. Both the synchronous and asynchronous portions of MICA have been developed to be extremely modular. MICA presents a simple programming model to code developers and also considers the needs of system integrators and maintainers. MICA has been used successfully in a complex robotics project involving a mobile 7-degree-of-freedom manipulator in a heterogeneous network with a body of software totaling over 100,000 lines of code. MICA has also been used in another robotics system, controlling a commercial long-reach manipulator. DOE

AN OBJECT-ORIENTED PROGRAM SPECIFICATION FOR A MOBILE ROBOT MOTION CONTROL LANGUAGE M.S. Thesis
Carl J. Grim 25 Mar. 1993 119 p
(AD-A267213) Avail: CASI HC A06/MF A02

The Yamabico Research Group at the Naval Postgraduate School is actively pursuing improvements in design and implementation of applications for it's family of autonomous mobile robots. This paper describes a new high level language for controlling the Yamabico-11, surnamed OOPS-MML (Object-Oriented Program Specification for a Mobile robot Motion control Language). Conceptual goals included a user friendly, high level interface coupled with a very abstract, efficient and compartmentalized architecture to employ a path planning and tracking application developed at NPS. The result is a robust and flexible robot control system that is intended to be implemented and employed onboard the Yamabico-11. DTIC

INTEGRATING REACTIVE AND DELIBERATIVE PLANNING FOR AGENTS
Jim Blythe and W. S. Reilly May 1993 28 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-90-C-1465; ARPA Order 7597)

(AD-A267631; CMU-CS-93-155) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Autonomous agents that respond intelligently in dynamic, complex environments need to be both reactive and deliberative. Reactive systems have traditionally fared better than deliberative planners in such environments, but are often hard to code and inflexible. To fill in some of these gaps, we propose a hybrid system that exploits the strengths of both reactive and deliberative systems. We demonstrate how out system controls a simulated household robot and compare our system to a purely reactive one in this domain. We also look at a number of relevant issues in anytime planning. ARPA UNMANNED GROUND VEHICLE STEREO VISION PROGRAM AT TELEOS RESEARCH Annual Report, Dec. 1991 - 1992
H. K. Nishihara Apr. 1993 36 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DACA76-92-C-0005)
(AD-A267632; TEC-0034) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This report reviews the work done during 1992 at Teleos Research in support of ARPA's UGV program. It first gives a broad overview of Teleos' approach to studying visual perception. In particular, the concept of minimal-meaningful-measurement tools is developed as a natural methodology for allowing a higher level application process to easily influence and exploit basic measurement modalities. The sign correlation algorithm under development at Teleos is then described in this context and the current performance benchmarks of our accelerator technology are presented. Several important results in stereo theory were obtained this year including: the development of techniques for automatically setting stereo matcher operating parameters, an analysis identifying the principal parameters affecting the magnitude of the disparity gradient effects, and a technique for improving area correlator performance in the presence of large stereo disparity gradients. Contributions were also made to the development and implementation of methods for evaluating stereo matching algorithms. UGV application specific studies were carried out in the areas of narrow-field-of-view stereo; wide field-of-view, high-resolution stereo mosaic building; stereo landmark navigation; 3-D tracking of moving objects; evaluation of hardware accelerators; and development of a low-cost mobile test facility. (Contract DE-AC05-84OR-21400)
(DE93-014888; ORNL/TM-12218) Avail: CASI HC A03

Multi-Sensor Integration (MSI) is the combining of data and information from more than one source in order to generate a more reliable and consistent representation of the environment. The need for MSI derives largely from basic ambiguities inherent in our current sensor imaging technologies. These ambiguities exist as long as the mapping from reality to image is not 1-to-1. That is, if different 'realities' lead to identical images, a single image cannot reveal the particular reality which was the truth. MSI techniques can be divided into three categories based on the relative information content of the original images with that of the desired representation: (1) 'detail enhancement,' wherein the relative information content of the original images is less rich than the desired representation; (2) 'data enhancement,' wherein the MSI techniques are concerned with improving the accuracy of the data rather than either increasing or decreasing the level of detail; and (3) 'conceptual enhancement,' wherein the image contains more detail than is desired, making it difficult to easily recognize objects of interest. In conceptual enhancement one must group pixels corresponding to the same conceptual object and thereby reduce the level of extraneous detail. This research focuses on data and conceptual enhancement algorithms. To be useful in many real-world applications, e.g., autonomous or teleoperated robotics, real-time feedback is critical. But, many MSI/image processing algorithms require significant processing time. This is especially true of feature extraction, object isolation, and object recognition algorithms due to their typical reliance on global or large neighborhood information. This research attempts to exploit the speed currently available in state-of-the-art digitizers and highly parallel processing systems by developing MSI algorithms based on pixel rather than global-level features. DISCRETE SLIDING MODE CONTROL FOR NONLINEAR SAMPLED DATA SYSTEMS Ph.D. Thesis
Jean M. Fernand 1993 190 p
(AD-A267500; AFIT/CI/CIA-93-008D) Avail: CASI HC A09/MF A02

Nonlinear control theory has been successfully applied to continuous, nonlinear, autonomous plant models. Implementation of these continuous control laws, using digital computers, has relied upon high sample frequencies to approximate the performance of continuous control. This thesis extends the design of continuous sliding mode control to discrete and to sampled data systems. Continuous, nonlinear, autonomous, second order dynamic plant models are discretized using an approximation to a Taylor series expansion. The discretization process accounts for the Zero Order Hold circuit, used to convert the discrete control output of the digital computer, into a piecewise continuous control input to the plant. A Discrete Sliding Mode Control is developed using Feedback Linearization to account for plant model nonlinearities, and Lyapunov Stability analysis to guarantee convergence to the sliding manifold. A five step design process systematizes the design technique. The design technique was applied to two unstable nonlinear second order plant models. Stability was confirmed by simulation studies. Comparison with the Continuous Sliding Mode Control implemented digitally, at a sample rate five times the plant model fundamental frequency, showed that the Discrete Sliding Mode Control retained asymptotic stability while the Continuous Sliding Mode Control did not. OPTIMAL TUNING OF HEAVY EQUIPMENT MOTION CONTROLLERS Final Report
William V. Miller and William N. Varnava Feb. 1993 102 p
(AD-A267873; NCEL-TR-940) Avail: CASI HC A06/MF A02

The objective of this work is the demonstration of feasibility of computerized optimal tuning of electronic motion controllers for mobile heavy equipment end-effectors. A backhoe yaw mode position control system was selected as the application for the purpose of proof of concept. The control algorithm selected for use in the servocontroller is Pseudo-Derivative Feedback (PDF). A computer model and an operational laboratory model of a translational electrohydraulic position control system dynamically analogous to the structural, mechanical, and hydraulic components of the selected backhoe position control system were constructed. These models were exercised in simulation of the backhoe system equipped with an electronic servocontroller incorporating the PDF algorithm. The computer model was first validated in its baseline configuration by way of comparison with baseline laboratory model test results. 'Baseline' refers to the complete system, but with proportional position feedback control in place of the PDF algorithm. An interesting aspect of this project is the two degree-of-freedom system constituted by the relatively compliant boom coupling the hydraulic actuator with a fully loaded bucket. This is of particular interest since the bucket does not lend itself to position instrumentation, thereby precluding load position feedback. Data supporting the successful demonstration of computerized automation of optimal tuning is presented. DTIC

(AD-A268104; AFIT/CI/CIA-93-004D) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

As robotic technology is considered for use in extreme environments, such as on-orbit and planetary exploration missions, the availability of the robotic systems become of paramount concern. Availability has two components: Reliability and Maintainability (R and M). Modular robotic systems address the maintainability portion of availability by minimizing repair time and allowing for the optimal reconfiguration of the robotic system for different tasks. The remaining portion of availability is the reliability of the modular robotic system. This dissertation presents a review of robotic system reliability technology and develops a technology roadmap outlining future directions for research and technology application that will improve the reliability of modular robotic systems. Also developed and tested is a design index based upon a modular robotic system's hardware and software reliability and the precision of the system. DTIC

Implementing a data-parallel language such as Fortran 90 on a distributed-memory parallel computer requires distributing aggregate data objects (such as arrays) among the memory modules attached to the processors. The mapping of objects to the machine determines the amount of residual communication needed to bring operands of parallel operations into alignment with each other. We present a program representation called the alignment distribution graph that makes these communication requirements explicit. We describe the details of the representation, show how to model communication cost in this framework, and outline several algorithms for determining object mappings that approximately minimize residual communication. Over recent years, Adaptive Mesh Refinement (AMR) algorithms which dynamically match the local resolution of the computational grid to the numerical solution being sought have emerged as powerful tools for solving problems that contain disparate length and time scales. In particular, several workers have demonstrated the effectiveness of employing an adaptive, block-structured hierarchical grid system for simulations of complex shock wave phenomena. Unfortunately, from the parallel algorithm developer's viewpoint, this class of scheme is quite involved; these schemes cannot be distilled down to a small kernel upon which various parallelizing strategies may be tested. However, because of their block-structured nature such schemes are inherently parallel, so all is not lost. In this paper we describe the method by which Quirk's AMR algorithm has been parallelized. This method is built upon just a few simple message passing routines and so it may be implemented across a broad class of MIMD machines. Moreover, the method of parallelization is such that the original serial code is left virtually intact, and so we are left with just a single product to support. The importance of this fact should not be underestimated given the size and complexity of the original algorithm. Author

MONOTONE APPROXIMATE QUERY PROCESSING Final Report, 1 Apr. 1990 - 30 Sep. 1992
Jane Liu 30 Sep. 1992 19 p
(Grant AF-AFOSR-0193-90)
(AD-A267153; AFOSR-93-0478TR) Avail: CASI HC A03/MF A01

This project was concerned with means to provide approximate answers to queries. The researchers developed a monotone query processing scheme. This scheme allows a data base system to provide for each a series of intermediate answers that are approximations of the exact answer. The approximate answers improve monotonically in accuracy as more data are retrieved and processed to answer the query. If for any reason query processing must be terminated prematurely before the exact answer is produced, the latest intermediate answer, that is, the best approximate answer produced so far, is made available to the application. For many time-critical applications, a timely approximate answer that is sufficiently good is better than no answer at all or the late exact answer. DTIC

VOLUME INTEGRAL EQUATIONS APPLIED TO CIRCULAR AND SQUARE CYLINDERS Final Report
Rose W. Wang Dec. 1992 100 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract F30602-91-D-0001)
(AD-A266635; RL-TR-92-300) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Three numerical integration methods are developed and used for evaluating the highly singular dyadic Green's function in the volume integral equations for scattering from dielectric cylinders. Numerical results indicate that for small permittivities or relatively small dielectric cylinders, the methods are quite efficient and give comparable accuracy. However, when both the relative permittivity and the size of the cylinder are increased, we experienced problems similar to those encountered by a number of previous researchers, namely, the results converge slowly for the TE polarization. MODAL ELEMENT METHOD FOR POTENTIAL FLOW IN NON-UNIFORM DUCTS: COMBINING CLOSED FORM ANALYSIS WITH CFD
Kenneth J. Baumeister and Joseph F. Baumeister Jan. 1994 18 p Prepared for presentation at the 32nd Aerospace Sciences Meeting and Exhibit, Reno, NV, 10-13 Jan. 1994; sponsored by AIAA
(RTOP 505-62-52)
(NASA-TM-106347; AIAA Paper 93-0813; E-8118; NAS 1.15:106347)
Avail: CASI HC A03/MF A01

An analytical procedure is presented, called the modal element method, that combines numerical grid based algorithms with eigenfunction expansions developed by separation of variables. A modal element method is presented for solving potential flow in a channel with two-dimensional cylindrical like obstacles. The infinite computational region is divided into three subdomains; the bounded finite element domain, which is characterized by the cylindrical obstacle and the surrounding unbounded uniform channel entrance and exit domains. The velocity potential is represented approximately in the grid based domain by a finite element solution and is represented analytically by an eigenfunction expansion in the uniform semi-infinite entrance and exit domains. The calculated flow fields are in excellent agreement with exact analytical solutions. By eliminating the grid surrounding the obstacle, the modal element method reduces the numerical grid size, employs a more precise far field boundary condition, as well as giving theoretical insight to the interaction of the obstacle with the mean flow. Although the analysis focuses on a specific geometry, the formulation is general and can be applied to a variety of problems as seen by a comparison to companion theories in aeroacoustics and electromagnetics. ON THE STABILITY ANALYSIS OF APPROXIMATE FACTORIZATION METHODS FOR 3D EULER AND NAVIER-STOKES EQUATIONS
A. O. Demuren (Old Dominion Univ., Norfolk, VA.) and S. O. Ibraheem (Old Dominion Univ., Norfolk, VA.) Oct. 1993 39 p
(Contract NCC3-233; RTOP 505-90-5K)
(NASA-TM-106314; ICOMP-93-29; E-8054; NAS 1.15:106314) Avail: CASI HC A03/MF A01

The convergence characteristics of various approximate factorizations for the 3D Euler and Navier-Stokes equations are examined using the von-Neumann stability analysis method. Three upwind-difference based factorizations and several central-difference based factorizations are considered for the Euler equations. In the upwind factorizations both the flux-vector splitting methods of Steger and Warming and van Leer are considered. Analysis of the Navier-Stokes equations is performed only on the Beam and Warming central-difference scheme. The range of CFL numbers over which each factorization is stable is presented for one-, two-, and three-dimensional flow. Also presented for each factorization is the CFL number at which the maximum eigenvalue is minimized, for all Fourier components, as well as for the high frequency range only. The latter is useful for predicting the effectiveness of multigrid procedures with these schemes as smoothers. Further, local mode analysis is performed to test the suitability of using a uniform flow field in the stability analysis. Some inconsistencies in the results from previous analyses are resolved. ADAPTIVE WAVELET COLLOCATION METHODS FOR INITIAL VALUE BOUNDARY PROBLEMS OF NONLINEAR PDE'S Final Report
Wei Cai and Jian-Zhong Wang Jul. 1993 53 p Submitted for publication
(Contract NAS1-19480; NSF ASC-91-13895; RTOP 505-90-52-01)
(NASA-CR-191507; NAS 1.26:191507; ICASE-93-48) Avail: CASI HC A04/MF A01

We have designed a cubic spline wavelet decomposition for the Sobolev space H(sup 2)(sub 0)(I) where I is a bounded interval. Based on a special 'point-wise orthogonality' of the wavelet basis functions, a fast Discrete Wavelet Transform (DWT) is constructed. This DWT transform will map discrete samples of a function to its wavelet expansion coefficients in O(N log N) operations. Using this transform, we propose a collocation method for the initial value boundary problem of nonlinear PDE's. Then, we test the efficiency of the DWT transform and apply the collocation method to solve linear and nonlinear PDE's. Author

When a designed experiment is conducted, the exact levels of controlled experimental variables specified by the design may not be attainable. Two different types of situations can occur in which the actual settings of the design variables deviate from the target design settings. In one case, the actual settings obtained are unknown. In the other case, the actual settings are known; however, desirable design properties such as orthogonality may have been lost. This paper examines the impact of known and unknown errors in experimental variables for designed experiments in which the response is assumed to be approximately linear in the region of interest. For comparison, the well known situation where the target values of the experimental variables can actually be obtained will also be considered. DOE

GENERAL ORDER CHARACTERISTIC METHODS FOR SOLVING NEUTRON TRANSPORT PROBLEMS
Y. Y. Azmy 1992 27 p Presented at the International Symposium on Transport Theory, Moscow, Russia, 23-31 May 1992
(Contract DE-AC05-84OR-21400)
(DE93-015824; CONF-9205173-1-Vugraphs) Avail: CASI HC A03/MF A01

The neutron transport equation in Cartesian geometry possesses straight line characteristics along which the streaming operator can be written as a full differential in terms of the characteristic length. This idea was used by Lathrop to develop the step characteristic method, which he showed to be positive definite but less accurate than conventional Diamond-Difference schemes. Several authors since then have developed new methods utilizing the characteristic curves (including non-Cartesian geometry). A Linear Characteristic Method, based on a more consistent linear representation of the incoming-surface and within-cell angular flux, has been developed and tested in two-dimensional geometry producing highly accurate and computationally efficient results. A similar linear method, with several modifications, was developed for three-dimensional Cartesian geometry, and implemented in ORNL's production code TORT. In this paper is presented a fully consistent, two-dimensional Cartesian geometry, general order characteristic method, in the same spirit as the previously developed, general order nodal method. Preliminary tests and numerical error analysis of the new method for orders up to five are also presented. DOE

SET-BASED BAYESIANISM
Henry E. Kyburg, Jr. and Michael Pittarelli Mar. 1992 42 p Sponsored in part by NSF, Army Signals Warfare Center and State Univ. of New York (TR-407) Avail: CASI HC A03/MF A01

Problems for strict and convex Bayesianism are discussed. A set-based Bayesianism generalizing convex Bayesianism and intervalism is proposed. This approach abandons not only the strict Bayesian requirement of a unique real-valued probability function in any decision-making context but also the requirement of convexity for a set-based representation of uncertainty. Levi's E-admissibility decision criterion is retained and is shown to be applicable in the non-convex case. Author (revised)

OPERATOR OVERLOADING AS AN ENABLING TECHNOLOGY FOR AUTOMATIC DIFFERENTIATION
G. F. Corliss (Marquette Univ., Milwaukee, WI.) and A. Griewank 1993 12 p Presented at the Object-Oriented Numerics Conference, Sunriver, OR, 25-27 Apr. 1993
(Contract W-31-109-eng-38)
(DE93-012899; ANL/MCS/CP-79481; CONF-9304114-5) Avail: CASI HC A03/MF A01

We present an example of the science that is enabled by object-oriented programming techniques. Scientific computation often needs derivatives for solving nonlinear systems such as those arising in many PDE algorithms, optimization, parameter identification, stiff ordinary differential equations, or sensitivity analysis. Automatic differentiation computes derivatives accurately and efficiently by applying the chain rule to each arithmetic operation or elementary function. Operator overloading enables the techniques of either the forward or the reverse mode of automatic differentiation to be applied to real-world scientific problems. We illustrate automatic differentiation with an example drawn from a model of unsaturated flow in a porous medium. The problem arises from planning for the long-term storage of radioactive waste. ACCURATE UPWIND METHODS FOR THE EULER EQUATIONS
Hung T. Huynh Nov. 1993 76 p
(RTOP 505-62-52)
(NASA-TM-106388; E-8210; NAS 1.15:106388) Avail: CASI HC A05/MF A01

A new class of piecewise linear methods for the numerical solution of the one-dimensional Euler equations of gas dynamics is presented. These methods are uniformly second-order accurate, and can be considered as extensions of Godunov's scheme. With an appropriate definition of monotonicity preservation for the case of linear convection, it can be shown that they preserve monotonicity. Similar to Van Leer's MUSCL scheme, they consist of two key steps: a reconstruction step followed by an upwind step. For the reconstruction step, a monotonicity constraint that preserves uniform second-order accuracy is introduced. Computational efficiency is enhanced by devising a criterion that detects the 'smooth' part of the data where the constraint is redundant. The concept and coding of the constraint are simplified by the use of the median function. A slope steepening technique, which has no effect at smooth regions and can resolve a contact discontinuity in four cells, is described. As for the upwind step, existing and new methods are applied in a manner slightly different from those in the literature. These methods are derived by approximating the Euler equations via linearization and diagonalization. At a 'smooth' interface, Harten, Lax, and Van Leer's one intermediate state model is employed. A modification for this model that can resolve contact discontinuities is presented. Near a discontinuity, either this modified model or a more accurate one, namely, Roe's flux-difference splitting. is used. The current presentation of Roe's method, via the conceptually simple flux-vector splitting, not only establishes a connection between the two splittings, but also leads to an admissibility correction with no conditional statement, and an efficient approximation to Osher's approximate Riemann solver. These reconstruction and upwind steps result in schemes that are uniformly second-order accurate and economical at smooth regions, and yield high resolution at discontinuities. Author

Research on this project has centered on the Phi-transform and wavelets and their application to various problems in image/signal processing, differential equations, and computer aided design. While the Phi-transform and wavelets have been developed in a quite general setting, several applications, most notably in image processing and numerical methods for differential equations, have pointed to several deficiencies in the traditional wavelet constructions. This has led researchers to consider alternate constructions of wavelets and related questions. Partial Differential Equations Concentration has been on two of the most prominent problems in partial differential equations: nonlinear equations such as conservation laws which arise in the study of wave propagation; and elliptic problems on nonsmooth domains which arise in scattering theory and many aspects of computer aided design. Researchers have investigated algorithms for image and surface compression based on wavelet decompositions. The algorithms developed have been shown by researchers to be optimal methods for compression in the sense of width or optimal recovery. They have continued their development of the second generation of the CAD system SLIP. They now have a prototype running which allows them to reconstruct a 3D CAD description from photographic images of a manufactured part. They continue their collaboration with various industries, government laboratories, and university centers. DTIC

ENERGY POTENTIAL ANALYSIS OF ZERO VELOCITY CURVES IN THE RESTRICTED THREE-BODY PROBLEM M.S. Thesis
Christopher M. Tuason May 1993 63 p
(AD-A267512; AFIT/CI/CIA-93-096) Avail: CASI HC A04/MF A01

The restricted problem of three bodies is a more tractable case than

the general three-body problem. Two primary celestial bodies are restricted to a circular orbit while a third body of negligible mass orbits in the plane of motion established by the primaries. Among many other practical applications, these restrictions form a rough approximation to the Earth, Moon, and spacecraft problem. This study analyzes the restricted problem by superposition of the energy potential wells that arise from the gravitational and inertial forces of the primaries in their circular motion. Three dimensional computer graphics are used to illustrate the surfaces that are created by the potential of the primaries. Zero velocity curves, also known as Hill's curves, describe the boundary between regions of possible motion and forbidden regions for the third body. These curves are the principle qualitative aspect of the restricted problem. A curve of zero velocity is found by taking a cross-section of the potential surface at a specific energy level corresponding to the Jacobian constant of the third body. The topology of a zero velocity curve may change depending on the energy of the third body. The Lagrange equilibrium points are clearly shown to be located at the critical energy levels where the topology of the zero velocity curves change. The superposition analysis in a three dimensional representation clearly reveals the component forces involved in the restricted problem and provide a visual model for understanding the stability of motion near the equilibrium points. MULTIPOLAR-LIKE FORM OF NONABELIAN GAUGE THEORIES
M. I. Shirokov 1992 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-626690; JINR-E-2-92-269) Avail: CASI HC A03 (US Sales Only)

A notion of the multipolar form of QED is exemplified by using its version valid for neutral systems such as two unlike charges. A new potential-like term P(sub perpendicular) arises in the multipolar Hamiltonian. It is shown to be a confining potential in a regularized variant of the multipolar form. This attracts interest to the discussion of multipolar-like form of nonabelian theories. The form is constructed for the case of nonquantized quarks interacting with gluons. A confining potential is shown to arise which is similar to P(sub perpendicular). But its relevance to the quark confinement problem requires further investigations. DOE

CLOSED FORM CHARACTERISTIC FUNCTION FOR GENERAL COMPLEX SECOND-ORDER FORM IN CORRELATED COMPLEX GAUSSIAN RANDOM VARIABLES Progress Report
Albert H. Nuttall 12 Jul. 1993 64 p
(AD-A267883; NUWC-NPT-TR-10403) Avail: CASI HC A04/MF A01

The properties of the left and right eigenvectors of generalized characteristic value problems with non-Hermitian complex matrices are reviewed, and diagonal expansions of various matrix combinations and inverses are derived. The interrelationships of the solutions of two related non-Hermitian characteristic value problems are determined and found to be simply related to the earlier eigenvectors and their properties. These results are then applied to the evaluation of the characteristic function of a general complex second-order form in correlated Gaussian random variables. The end result is a compact closed form result involving a finite product and a finite sum, along with one square root and exponential. This expression allows for rapid evaluation of the characteristic function for numerous values of its complex argument. DTIC

NUMERICAL SOLUTION OF A SECOND ORDER BOUNDARY PROBLEM FOR TWO DIMENSIONS USING GALERKIN APPROXIMATIONS M.S. Thesis
Craig L. Arnold Apr. 1993 148 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268126; AFIT/CI/CIA-93-058) Avail: CASI HC A07

This report outlines the development and use of the program LAPLACE. LAPLACE is capable of solving a second order two dimensional boundary value problem, employing graphics to assist in mesh generation and solution presentation. Galerkin approximation methods, along with the development of a finite element mesh, permit the program to calculate nodal results over the domain of the problem. The use of these nodal solutions with additional subroutines allows for the computation of equipotential lines and lines perpendicular to the equipotential lines. The current format of this program solves Laplace's Equation. Nodal solutions to Laplace's Equation are calculated over the domain of the problem and used as the basis for the generation of equipotential lines and their perpendiculars. Equipotential lines are interpreted as contours and their perpendiculars represent flow lines for the solution to Laplace's Equation. These lines are used in combination to develop a flow net over the domain of the problem and this flow net is graphically displayed. This program was written with the capability of solving several types of second order two dimensional boundary value problems. The calculation of solutions to other second order two dimensional boundary value problems is accomplished by entering the appropriate functional coefficients of the differential equation into one subroutine. A NEW METHOD FOR GENERATING BAYES CLASSIFIERS ASSUMING MIXTURES OF GAUSSIAN DENSITIES
Hans Christian Palm 22 Dec. 1992 33 p
(FFI-91/4029; ETN-93-94449) Avail: CASI HC A03/MF A01

A method for generating a Bayes classifier assuming linear mixtures of Gaussian probability densities is presented. The aim was to create reliable and computationally efficient classifiers for real time applications. The concept consists of first designing a Bayes classifier assuming Gaussian densities. If the error rate is unacceptable, the number of Gaussian components in one of the classes is increased by one, new classifier parameters are estimated and the error rate is computed. This process of classifier generation and evaluation continues until a set of criteria is fulfilled. The classifier is compared with other relevant classifiers such as Bayes classifier with Gaussian assumptions, Bayes classifier assuming a linear mixture of two Gaussian densities, various piecewise linear classifiers and the nearest neighbor rule. Both synthetic and real data sets were used. Tests indicate that the algorithm produces fast and reliable classifiers with equal or better performance than the 'real time' classifiers used in the comparison. ESA

STATISTICAL COMPUTATION OF TOLERANCE LIMITS
J. T. Wheeler Oct. 1993 45 p Sponsored by NASA, Washington
(NASA-TM-108424; NAS 1.15:108424) Avail: CASI HC A03/MF A01

Based on a new theory, two computer codes were developed specifically to calculate the exact statistical tolerance limits for normal distributions within unknown means and variances for the one-sided and two-sided cases for the tolerance factor, k. The quantity k is defined equivalently in terms of the noncentral t-distribution by the probability equation. Two of the four mathematical methods employ the theory developed for the numerical simulation. Several algorithms for numerically integrating and iteratively root-solving the working equations are written to augment the program simulation. The program codes generate some tables of k's associated with the varying values of the proportion and sample size for each given probability to show accuracy obtained for small sample sizes. (Grant NAGw-2945)
(NASA-CR-194558; NAS 1.26:194558) Avail: CASI HC A01/MF A01

The present project was initiated with two specific medium-term goals: first, to develop a novel approach, based on global modeling and maximum likelihood, to the study of databases of stellar data, with specific attention to the results to be obtained by the Hipparcos mission; and second, to apply and test the methodology developed to existing ground-based data. The long-term goal was of course to integrate the methodology and the ground-based data into a global study of the results of the Hipparcos mission, which were expected to be made available in 1995 or 1996. The closing of the project is due to the recent change of home institution of the PI, who has moved from the University of Illinois to Johns Hopkins University. As a consequence of this move, the three scientists involved in this project will be in close proximity, thereby hopefully improving their ability to collaborate and increasing the productivity of the project. Continued funding for the project has been requested from Johns Hopkins University. This report describes briefly the results obtained so far both on the technical aspect of software development and on the scientific side of applications to existing ground-based data. Significant progress has been made on both counts, with several papers published in (or submitted to) refereed journals and in conference proceedings. Because it is hoped that the project can be successfully continued with NASA support, the report of the progress in each area includes also an assessment of how the current results fit in the expected continuation of the project. Our results to date include: code development (essentially completed); a detailed study of the kinematics and dynamics of stars escaping from the Hyades cluster, relevant to the question of membership in the Hyades; a study of the kinematics and luminosity calibration of nearby dwarfs; an assessment of the quality of the photometry included in the Hipparcos Input Catalog; and two studies of properties of nearby clusters, including a moving-cluster determination of the distance to Praesepe. The bibliography includes three papers submitted to refereed journals, two of which have already been published, and four contributions to conference proceedings. Finally, the work so far has also provided a very good introduction to stellar dynamics and astrometry for an undergraduate student, with educational benefits that had not been foreseen in the original proposal. BOUNDS ON INCONSISTENT INFERENCES FOR SEQUENCES OF TRIALS WITH VARYING PROBABILITIES
Herman Chernoff and Ying-Nian Wu 21 Jun. 1993 20 p Sponsored by ONR
(AD-A267146; ONR-C-13) Avail: CASI HC A03/MF A01

Consider independent pairs of Bernoulli trials on two unknown sequences of probabilities p(1) = (p(sub i)(1) : 1 less than or equal to i less than or equal to n) and p(2) = (p(sub i)(2) : less than or equal to i less than or equal to n). The data are the numbers of pairs which consist of (0,0), (0,1), (1,0), and (1,1) and can be summarized in a two-way table with entries n(sub 00), n(sub 01), n(sub 10) and n(sub 11) adding up to n. The two problems of estimating the mean and variance of the number of discordant pairs n(sub 01) + n(sub 10) when H(sub 0) : p(l) = p(2) is true, and of testing H(sub 0) using the number of discordant pairs as a test statistic are considered. Two novel issues arise. While relevant parameters can not be estimated consistently from the available data, useful bounds on these can be derived. While the test is poor for alternatives typically considered in the literature, it may be effective for detecting the presence of unknown explanatory factors which discriminate between supposedly matched pairs. NONLINEAR ANALYSIS OF MECHANICAL SYSTEMS UNDER COMBINED HARMONIC AND STOCHASTIC EXCITATION Annual Report, 15 Nov. 1991 - 14 Nov. 1992
N. S. Namachchivaya 27 May 1993 73 p
(Grant AF-AFOSR-0041-91)
(AD-A266217; AFOSR-93-0444TR) Avail: CASI HC A04/MF A01

In the AFOSR grant, the complex interaction between noise, stability and nonlinear dynamics inherent in mechanical systems was examined and a consistent method for analyzing stochastic nonlinear systems was developed. The specific objective of the current work, is to examine, both theoretically and experimentally, the nonlinear response of gyroscopic systems under stochastic and harmonic excitation. This study will include the following: examination of the combined effects of mass imbalance, asymmetry, and realistic boundary conditions on the nonlinear response of rotating systems; development of a general nonlinear control technique designed to suppress unwanted vibrations and chaotic motions in gyroscopic systems; and experimental verification of the theories developed. STATISTICS OF THE HALF-INTEGER STOPBAND
S. Dutt, F. Chautard, R. Gerig, and S. Kauffmann May 1993 5 p
Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contract DE-AC35-89ER-40486)
(DE93-016101; SSCL-Preprint-442; CONF-930511-185) Avail: CASI HC A01/MF A01

We consider the statistical nature of the stopband set up in the vicinity of a half-integer tune when a linear lattice is subjected to quadrupole errors distributed according to Gaussians. The probability density function of the stopband, treated as a complex number, is found to be a correlated bivariate Gaussian in the real and imaginary parts. The mean magnitude of the stopband is calculated in terms of the complete elliptic integral of the first kind, and the conditional probability density of its magnitude is obtained in closed form. A number of limiting conditions are studied. Finally, we estimate the requirements on a correction system for neutralizing the stopband with a given probability of success. DOE

EXPANSIONS OF CUMULATIVE DISTRIBUTION FUNCTIONS DIRECTLY FROM CHARACTERISTIC FUNCTIONS Technical Progress Report
Albert H. Nuttall 8 Jun. 1993 69 p
(AD-A267727; NUWC-NPT-TR-10371) Avail: CASI HC A04/MF A01

Expansions of probability density functions and their corresponding cumulative distribution functions, directly from given characteristic functions, have been achieved in a series form, with four parameters which are under the control of the user, thereby enabling realization of more rapidly convergent terms. Typical examples of characteristic functions encountered in detection of multiple matched filter outputs are presented, along with an application to a noisy channel with partially correlated fading. The series presented here enable immediate evaluation of performance of a related normalizer once the expansion coefficients have been determined. An extension to allow for additive Gaussian noise is realized through a set of simple but efficient recursions. DTIC

ENERGY DEPOSITION FLUCTUATIONS INDUCED BY IONS IN MICROVOLUMES AND NANOVOLUMES: AN ANALYTIC APPROACH. 1: THEORY Final Report
Michael A. Xapsos, Edward A. Burke, and Geoffrey P. Summers (Maryland Univ., Baltimore.) 22 Jul. 1993 66 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A267959; NRL/MR/6615-93-6948) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

A new analytic method is developed for calculating fluctuations in energy deposition induced by ions in sites having dimensions as small as one nanometer. The method considers two contributions to the fluctuation phenomena. The first is due to direct ion interactions with the site. The second is due to secondary electrons that strike the site but which are produced by ion interactions in the surrounding medium. Particular attention is given to the way the two contributions are combined to describe the complete stochastic process. This analytic combination of the two contributions has not previously been developed in the context of microdosimetry where Monte Carlo simulations are often used to describe the combined processes. The new analytic approach is much more versatile than Monte Carlo methods and can easily be applied to different incident radiations, target materials and target geometries. In addition to its versatility and convenience, the physical factors which contribute to the fluctuations in energy deposition are brought clearly into focus. DTIC

STATE SPACE PARTITIONING METHODS FOR SOLVING A CLASS OF STOCHASTIC NETWORK PROBLEMS Ph.D. Thesis
Jay A. Jacobson May 1993 134 p Limited Reproducibility: More than 20% of this document may be affected by poor print and microfiche quality
(AD-A267494; AFIT/CI/CIA-93-006D) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This study focuses on state space partitioning techniques for computing measures related to the operation of stochastic systems. These methods iteratively decompose the system state space until the measure of interest has been determined. The information available in each iteration yields lower and upper bounds on this measure, and can be used to design efficient Monte Carlo estimation routines. We present here new theoretical results identifying strategies for significantly enhancing the performance of these algorithms. Using these results, we describe a generalized algorithm that can easily be tailored to address a variety of problems. We net use this algorithm to analyze two important models in the area of stochastic network optimization. The first concerns the probabilistic behavior of minimum spanning trees in graphs with discrete random arc weights. Specifically, we compute the probability distribution of the weight of a minimum spanning tree and the probability that a given arc is on a minimum spanning tree. Both of these problems are shown to be P-hard. The second model considers minimum cost flows in networks with discrete random arc costs and capacities. DTIC

FAST SIMULATION OF STEADY-STATE AVAILABILITY IN NON-MARKOVIAN HIGHLY DEPENDABLE SYSTEMS
Peter W. Glynn, Victor F. Nicola, Perwez Shahabuddin, and Philip Heidelberger Dec. 1992 22 p
(Contract DAAL03-91-G-0101)
(AD-A266747; ARO-26863.8-EG-S) Avail: CASI HC A03/MF A01

This paper considers efficient simulation techniques for estimating steady-state quantities in models of highly dependable computing systems with general component failure and repair time distributions. Earlier approaches in this application setting for steady-state estimation rely on the regenerative method of simulation which can be used when the failure time distributions are exponentially distributed. However, when the failure times are generally distributed the regenerative structure is lost and a new approach must be taken. The approach we take is to exploit a ratio representation for steady-state quantities in terms of cycles that are no longer independent and identically distributed. A splitting technique is used in which importance sampling is used to speed up the simulation of rare system failure events during a cycle, and standard simulation is used to estimate the expected cycle length. Experimental results show that the method is effective in practice. DTIC

THE STRATEGIC ENVIRONMENTAL RESEARCH AND DEVELOPMENT PROGRAM: A NEW PARADIGM FOR SPACE, THE ENVIRONMENT, AND NATIONAL SECURITY Individual Study Project
Thomas C. Suermann 17 Mar. 1993 44 p
(AD-A266222) Avail: CASI HC A03/MF A01

Future U.S. national security objectives will encompass a broader range of technological systems and applications than they have in the past. Dual-use technologies will be vitally important to maintaining U.S. leadership in the world community, in space-based security, and in global environmental security and stewardship. The Strategic Environmental Research and Development Program (SERDP), as well as NASA's emerging, Mission-To-Planet-Earth Program, individually and collectively offer national ways of leveraging technology. They will provide mutually reinforcing endeavors which will enhance our national security. This study focuses on the benefits of using space technology applications within these programs to enhance military and environmental security. It is an attempt to define part of the peace dividend which is emerging from the end of the Cold War, and it offers some recommendations for improving dual-technology synergism in augmenting national military security and environmental stewardship. NOT READY FOR THE FIRST SPACE WAR. WHAT ABOUT THE SECOND? Final Report
Steven J. Bruger 17 May 1993 34 p
(AD-A266557) Avail: CASI HC A03/MF A01

For the first time in history, space systems were employed during the Persian Gulf War at not only the strategic level of war, but also at the operational and tactical levels as well. Spaceborne assets had a dramatic effect on the ability of the operational level commander to successfully plan and prosecute a comprehensive warfighting campaign. This paper outlines the mission capabilities of U.S. Space Command, and its components, and examines how space assets contributed to concrete, coherent military action at the operational level of war in support of the ultimate national political goals and objectives. The impact of space forces during Operations Desert Shield/Desert Storm, specifically force enhancement assets, is examined and six implications for the future are offered. DTIC

HYPERVELOCITY ORBITAL INTERCEPT GUIDANCE USING CERTAINTY CONTROL
Salvatore Alfano and Charles E. Fosha, Jr. Jun. 1993 8 p Repr. from Journal of Guidance, Control, and Dynamics, v. 14, no. 3, May-Jun. 1991 p 574-580 See also A91-39411
(AF Proj. 9993)
(AD-A267297; PL-TR-93-1020; AD-E201508) Avail: CASI HC A02/MF A01

Terminal guidance of a hypervelocity exoatmospheric orbital interceptor with free end time is examined. A new approach called certainty control is developed where control energy expenditure is reduced by constraining the expected final state to a function of projected estimate error. Conceptually, the constraint produces a shrinking sphere about the predicted impact point with the radius being a function of estimated error. If the predicted miss is inside or touching the sphere, thrusting is not necessary. The interceptor is modeled as a satellite with lateral thrusting capability using two-body orbital dynamics. The target is modeled as an intercontinental ballistic missile (ICBM) in its final boost phase prior to burnout. Filtering is accomplished using an eight-state extended Kalman filter with line-of-sight and range updates. The estimated relative trajectory and variances are propagated numerically to predicted impact time and then approximated by splines which eliminate the need to propagate new data repeatedly when present conditions are varied. A search is then made for a new impact time and point that will minimize present interceptor velocity changes and final miss distance. This control strategy, which is applied to two intercept problems, substantially reduces fuel consumption. DTIC

STUDY OF THE NATIONAL SCIENCE FOUNDATION'S SOUTH POLE STATION AS AN ANALOGOUS DATA BASE FOR THE LOGISTICAL SUPPORT OF A MOON LABORATORY Final Report
H. H. Hickam, Jr. Oct. 1993 47 p
(RTOP 307-52-00)
(NASA-TM-108429; NAS 1.15:108429) Avail: CASI HC A03/MF A01

The day will come when the United States will want to return to the Earth's Moon. When that occurs, NASA may look to the Apollo program for technical and inspirational guidance. The Apollo program, however, was designed to be an end to itself--the landing of a man on the Moon and his return safely within the decade of the 1960's. When that was accomplished, the program folded because it was not self-sustaining. The next time we return to the Moon, we should base our planning on a program that is designed to be a sustained effort for an indefinite period. It is the thrust of this report that the South Pole Station of the National Science Foundation can be used to develop analogs for the construction, funding, and logistical support of a lunar base. Other analogs include transportation and national efforts versus international cooperation. A recommended lunar base using the South Pole Station as inspiration is provided, as well as details concerning economical construction of the base over a 22-year period. Author

LINEAR STABILITY OF STATIONARY SOLUTIONS OF THE VLASOV-POISSON SYSTEM IN THREE DIMENSIONS
J. Batt (Ludwig-Maximilians-Univ., Munich, Germany.), G. Rein (Ludwig-Maximilians-Univ., Munich, Germany.), and P. J. Morrison Mar. 1993 26 p
(Contract DE-FG05-80ET-53088)
(DE93-013873; DOE/ET-53088/597; IFSR-597) Avail: CASI HC A03/MF A01

Rigorous results on the stability of stationary solutions of the Vlasov-Poisson system are obtained in both the plasma physics and stellar

dynamics contexts. It is proven that stationary solutions in the plasma physics (stellar dynamics) case are linearly stable if they are decreasing (increasing) functions of the local, i.e. particle, energy. The main tool in the analysis is the free energy of the system, a conserved quantity. In addition, an appropriate global existence result is proven for the linearized Vlasov-Poisson system and the existence of stationary solutions that satisfy the above stability condition is established. DISTRIBUTIVELY GENERATED MATRIX NEAR RINGS
S. J. Abbasi Apr. 1993 5 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(DE93-628588; IC-93/79) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

It is known that if R is a near ring with identity then (I,+) is abelian if (I(sup +),+) is abelian and (I,+) is abelian if (I*,+) is abelian. This paper extends these results. We show that if R is a distributively generated near ring with identity then (I,+) is included in Z(R), the center of R, if and only if (I(sup +),+) is included in Z(M(sub n)(R)), the center of matrix near ring M(sub n)(R). Furthermore (I,+) is included in Z(R) if and only if (I*,+) is included in Z(M(sub n)(R)). DOE

(DE93-628590; IC-93/93) Avail: CASI HC A03 (US Sales Only)

We define new quantizations of the Heisenberg group by introducing new quantizations in the universal enveloping algebra of its Lie algebra. Matrix coefficients of the Stone-von Neumann representation are preserved by these new multiplications on the algebra of functions on the Heisenberg group. Some of the new quantizations provide also a new multiplication in the algebra of theta functions; we obtain in this way Sklyanin algebras. DOE

FIXED POINT ITERATIONS FOR STRICTLY HEMI-CONTRACTIVE MAPS IN UNIFORMLY SMOOTH BANACH SPACES
C. E. Chidume and M. O. Osilike May 1993 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-628591; IC-93/96) Avail: CASI HC A03 (US Sales Only)

It is proved that the Mann iteration process converges strongly to the fixed point of a strictly hemi-contractive map in real uniformly smooth Banach spaces. The class of strictly hemi-contractive maps includes all strictly pseudo-contractive maps with nonempty fixed point sets. A related result deals with the Ishikawa iteration scheme when the mapping is Lipschitzian and strictly hemi-contractive. Our theorems generalize important known results. DOE

The aims of this research grant have not been modified. The aims are to do the following: to extend the reliability models for oxide wearout and hot-electron-induced degradation from DC stress to AC stress by arbitrary waveforms as encountered in circuits; to develop a circuit reliability simulator that incorporates the best known reliability models for oxide and hot electrons effects; and to develop improved device and reliable oxides. We have set a new world record in silicon transistor speed--13.5ps at room temperature and at 1.5 volt. This was a result of our research into the design and fabrication of advanced silicon-on-insulator MOS transistors. The goal is to understand the reliability limits of transistor scaling. DTIC

MAGNETIC EFFECTS IN ANOMALOUS DISPERSION
M. Blume 1992 19 p Presented at the International Conference on Anomalous Scattering, Hamburg, Germany, 17-21 Aug. 1992
(Contract DE-AC02-76CH-00016)
(DE93-014291; BNL-48895; CONF-9208186-2) Avail: CASI HC A03/MF A01

Spectacular enhancements of magnetic x-ray scattering have been predicted and observed experimentally. These effects are the result of resonant phenomena closely related to anomalous dispersion, and they are strongest at near-edge resonances. The theory of these resonances will be developed with particular attention to the symmetry properties of the scatterer. While the phenomena to be discussed concern magnetic properties, the transitions are electric dipole or electric quadrupole in character and represent a subset of the usual anomalous dispersion phenomena. The polarization dependence of the scattering is also considered, and the polarization dependence for magnetic effects is related to that for charge scattering and to Templeton type anisotropic polarization phenomena. It has been found that the strongest effects occur in rare-earths and in actinides for M shell edges. In addition to the scattering properties the theory is applicable to 'forward scattering' properties such as the Faraday effect and circular dichroism. DOE

THE INVERSE PROBLEM TO THE EVALUATION OF MAGNETIC FIELDS
S. Caspi, M. Helm, L. J. Laslett, and V. Brady Dec. 1992 26 p
(Contract DE-AC03-76SF-00098)
(DE93-015239; LBL-33316; SC-MAG-412) Avail: CASI HC A03/MF A01

In the design of superconducting magnet elements, such as may be required to guide and focus ions in a particle accelerator, one frequently premises some particular current distribution and then proceeds to compute the consequent magnetic field through use of the laws of Biot and Savart or of Ampere. When working in this manner one of course may need to revise frequently the postulated current distribution before arriving at a resulting magnetic field of acceptable field quality. It therefore is of interest to consider an alternative ('inverse') procedure in which one specifies a desired character for the field required in the region interior to the winding and undertakes them to evaluate the current distribution on the specified winding surface that would provide this desired field. We may note that in undertaking such an inverse procedure we would wish, on practical grounds, to avoid the use of any 'double-layer' distributions of current on the winding surface or interface but would not demand that no fields be generated in the exterior region, so that in this respect the goal would differ in detail from that discussed by other authors, in analogy to the distribution sought in electrostatics by the so-caged Green's equivalent stratum. A REVIEW OF SOME DYNAMICS MODELS IN SIX-DIMENSIONAL PHASE SPACE AND THEIR SUITABLE CONDITIONS OF MOTION EQUATION
Qingxi Cao and Guan Xialing (Academia Sinica, Beijing, China.) Sep. 1991 12 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-623741; CNIC-00537; IAE-0094) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

Based on the analysis of motion features for a pulse beam, as the

dynamics models of motion system in a six-dimensional phase space, target measuring model and instantaneous distribution model are described. The strict dynamics motion equations of particle beams have been derived both in Cartesian coordinate system and in curvilinear coordinate system for two kinds of models mentioned above. The force components in three directions have been given for two models and two coordinate systems. The model of Karl L. Brown's theory and his dynamics motion equations were also analyzed. The features of two theory models and their suitable conditions were discussed. It is confirmed that the 'target measuring model' is a better one to describe a pulse beam. That is because the time t and t' = dt/d(zeta) are selected as the longitudinal coordinate of six dimensional coordinate system. The status described by this model is not instantaneous but a status with time distribution in a fixed position, eg. in a target. With this model, the time features of a pulse beam can be given directly. But when the space charge has to be considered, the instantaneous distribution model will be better than the target measuring model. DOE

[A BASIC PRINCIPLES DESCRIPTION OF LIQUID VAPOR PHASE TRANSITIONS] Progress Report

15 Jul. 1993 4 p

(Contract N00014-93-1-0015)

(AD-A268331) Avail: CASI HC A01/MF A01

The research effort of Slemrod has been directed to developing a discrete velocity kinetic theory model for liquid-vapor phase transitions. The aim of the research is to develop a 'basic principles' description of liquid-vapor phase transitions (such as those occurring in an internal combustion engine) which is not a priori biased by ad hoc equations of state (constitutive relations). The modelling is almost completely finished, numerical simulations are being run, and a first draft of the results is being written. The model is of the following form: We consider a gas of clusters in three dimensional space made up monomers, dimers, trimers, etc. which can move with seven fixed momenta: the six unit vectors + or - i, + or - j, + or - k plus the 0 vector. The clusters can collide elastically and inelastically. The elastic collisions conserve mass, momentum, and energy. The inelastic collisions occur when clusters coagulate or fragment and conserve mass and momentum. In an inelastic collisions kinetic energy is lost. DTIC

LOW DIELECTRIC CONSTANT INSULATORS AND GOLD METALLIZATION FOR GHz MULTI-CHIP MODULES, PART 2 Annual Performance Report

Paul Kohl, Sue A. Bidstrup, and David Hertling Jul. 1993 60 p

(Contract N00014-91-J-4008)

(AD-A268590) Avail: CASI HC A04/MF A01

The goal of this program is to investigate new dielectrics, metals, and processes for the fabrication of multi-chip modules which hold the promise of exceptional electrical performance in the GHz region in addition to high yield and high reliability. The low dielectric constant insulators are being evaluated through the fabrication of in-situ test structures using noble metals. In the course of doing this evaluation, a simple process for gold or silver MCM's has been investigated. A processing scheme using noble metals (gold and silver) as the interconnection metallization in the module has been developed and is being characterized. The noble metal process has fewer process steps than the equivalent copper process and is potentially lower cost, particularly when high reliability is important. It has been observed that silver has an advantage in that it maintains its bulk conductivity during high temperature processing and has low residual stress. DTIC

COMPARISON OF COMPUTER PREDICTIONS AND MAGNETIC FIELD MEASUREMENTS FOR AN IRON SPECTROMETER MAGNET

G. T. Danby, J. W. Jackson, W. Meng, and C. Spataro 1993 3 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993

(Contract DE-AC02-76CH-00016)

(DE93-016164; BNL-48306; CONF-930511-196) Avail: CASI HC A01/MF A01

Three dimensional computer calculations using the Program TOSCA have been made for a complex-shaped iron magnet. Precision field measurements were made on this magnet in preparation for its installation in a new Low Energy Separated Beam for the post-Booster high proton intensity AGS at Brookhaven National Laboratory. Point-by-point direct comparisons for field values are described encompassing the entire useful acceptance. The predictability of high order multipoles is described, including the region of the magnet ends. Computer predicted focal properties are compared with results of experimental data analysis. The method of measurement and analysis, as well as comments on the computer calculations are described. Conclusions are drawn on the accuracy of calculations with respect to higher order moments and the impact on future beam optical design and execution of three dimensional computer codes. DOE

A scale model Advanced Ducted Propulsor (ADP) was tested in NASA Lewis Research Center's 8- by 6-Foot Wind Tunnel to obtain acoustic data at cruise conditions. The model, designed and manufactured by Pratt & Whitney Division of United Technologies, was tested with three inlet lengths. The model has 16 rotor blades and 22 stator vanes, which results in a cut-on condition with respect to rotor-stator interaction noise. Comparisons of the noise directivity of the ADP with that of a previously tested high-speed, unducted propeller showed that the ADP peak blade passing tone was about 30 dB below that of the propeller, and therefore, should not present a cabin or enroute noise problem. The maximum blade passing tone first increased with increasing helical tip Mach number, peaked, and then decreased at a higher Mach number. The ADP tests with the shortest inlet showed more noise in the inlet arc than did tests with either of the other two inlet lengths. Author

TECHNICAL EVALUATION REPORT ON THE AGARD-PEP SPECIALISTS MEETING ON COMBAT AIRCRAFT NOISE
W. B. deWolf 14 Nov. 1991 8 p Meeting held in Bonn, Germany, 23-25 Oct. 1991 Limited Reproducibility: More than 20% of this document may be affected by poor print and microfiche quality
(NLR-TP-91445-U; ETN-93-94342) Avail: Issuing Activity (European Space Agency (ESA))

A technical evaluation of the AGARD-PEP specialists' meeting on combat aircraft noise at Bonn (Germany), Oct. 1991 which concentrated on the noise from combat aircraft in low altitude high speed training missions, is presented. Considerable improvement on the understanding and prediction of various noise components was reported. One of the main conclusions was that the overall effectiveness of reduction of engine based noise critically depends on the airframe noise level at high flight speeds, and more work is required in this area to clarify the situation. CALL SIGN INTELLIGIBILITY IMPROVEMENT USING A SPATIAL AUDITORY DISPLAY
Durand R. Begault Apr. 1993 11 p Sponsored by NASA, Washington
(RTOP 505-67-01)
(NASA-TM-104014; A-93067; NAS 1.15:104014) Avail: CASI HC A03/MF A01

A spatial auditory display was used to convolve speech stimuli, consisting of 130 different call signs used in the communications protocol of NASA's John F. Kennedy Space Center, to different virtual auditory positions. An adaptive staircase method was used to determine intelligibility levels of the signal against diotic speech babble, with spatial positions at 30 deg azimuth increments. Non-individualized, minimum-phase approximations of head-related transfer functions were used. The results showed a maximal intelligibility improvement of about 6 dB when the signal was spatialized to 60 deg or 90 deg azimuth positions. Author (revised)

MODAL RING METHOD FOR THE SCATTERING OF SOUND
Kenneth J. Baumeister and Kevin L. Kreider (Akron Univ., OH.) Nov. 1993 10 p Presented at the ASME Winter Annual Meeting, New Orleans, LA, 28 Nov. - 3 Dec. 1993; sponsored by ASME
(RTOP 505-62-52)
(NASA-TM-106342; E-8111; NAS 1.15:106342) Avail: CASI HC A02/MF A01

The modal element method for acoustic scattering can be simplified when the scattering body is rigid. In this simplified method, called the modal ring method, the scattering body is represented by a ring of triangular finite elements forming the outer surface. The acoustic pressure is calculated at the element nodes. The pressure in the infinite computational region surrounding the body is represented analytically by an eigenfunction expansion. The two solution forms are coupled by the continuity of pressure and velocity on the body surface. The modal ring method effectively reduces the two-dimensional scattering problem to a one-dimensional problem capable of handling very high frequency scattering. In contrast to the boundary element method or the method of moments, which perform a similar reduction in problem dimension, the model line method has the added advantage of having a highly banded solution matrix requiring considerably less computer storage. The method shows excellent agreement with analytic results for scattering from rigid circular cylinders over a wide frequency range (1 is equal to or less than ka is less than or equal to 100) in the near and far fields. DIGITAL REVERBERATION TIME MEASUREMENT SYSTEM Patent
Blair M. Kipple, inventor (to Navy), Douglas A. Noll, inventor (to Navy), and Andrew H. Chiang, inventor (to Navy) 13 Jul. 1993 15 p Filed 28 Feb. 1991
(AD-D015892; US-Patent-5,227,982; US-Patent-Appl-SN-661932; US-Patent-Class-364-508) Avail: US Patent and Trademark Office

An apparatus and method, having both structural and acoustical applicability, for measuring damping of a solid or fluid resonant physical system in terms of reverberation or decay time, featuring a digital computer based measurement system in which plural numbers of resonances are grouped into single analysis bands are presented. The resonant response is converted into an electronic signal, which is then pre-amplified, filtered, post-amplified, digitized and finally processed so as to determine the reverberation time in the resonant physical system. CORTICAL ADAPTIVE FILTERING IN BIOACOUSTIC SIGNAL CLASSIFICATION Progress Report, 1 Nov. 1992 - 30 Apr. 1993
Norman M. Weinberger 30 Apr. 1993 13 p
(Contract N00014-91-J-1193)
(AD-A266229) Avail: CASI HC A03/MF A01

Frequency receptive fields (RF) in the auditory cortex are systematically altered as a result of a brief training experience. Responses to training signals (conditioned stimulus, CS) are increased whereas responses to other frequency, including the pretraining best frequency (BF) are decreased.

These changes can be sufficiently large so that the frequency of the CS becomes the new BF. Frequency RFs describe the frequency filtering characteristics of auditory system neurons. Systematic changes of these RF may then be seen to indicate adaptive filtering; i.e., adaptive filtering may be said to have occurred when training with a selected acoustic signal results in plasticity of the receptive field that is highly specific to that signal. The goal of this project is to determine the underlying processes of adaptive filtering both neurophysiologically and computationally. Of particular, we are applying findings from olfactory (paleo) cortex and training rules derived from the hippocampus (archicortex) to the architecture of the thalamo-neocortical auditory system to determine computational implications for bioacoustic signal classification. An initial stage of this project has been to determine fundamental characteristics of adaptive filtering which are essential for computational analysis. These findings provide a basis for experiments to test predictions which have been generated by the computational work. DTIC

ACOUSTIC WAVES IN COMPLICATED GEOMETRIES AND THEIR INTERACTIONS WITH LIQUID-PROPELLANT DROPLET COMBUSTION Final Report, 14 Mar. 1991 - 14 May 1993

Vigor Yang, M. W. Yoon, and J. M. Wicker 14 May 1993 145 p

(Grant AF-AFOSR-0171-91)

(AD-A267260; AFOSR-93-0463TR) Avail: CASI HC A07/MF A02

A linear and nonlinear acoustic wave analysis has been developed for baffled combustion chambers. Results suggest three important effects of baffles on transverse modes of combustion instability. First, transverse waves can be longitudinalized inside baffle compartments. This may decouple combustion response from oscillatory motions if the processes near the injector face are sensitive to transverse variations in pressure. Second, severe restriction of the transverse component of acoustic velocity fluctuations is observed in baffle compartments. This may be key in stabilizing systems with velocity-sensitive combustion. Third, the frequency of oscillation is decreased with the addition of baffles, in agreement with experiments. One potentially destabilizing effect of baffles is the observed pressure concentration at the injector face. Pressure sensitive processes in this region may enhance instability. Limit cycles were observed for both two- and three-dimensional baffled chambers. Their most remarkable characteristic is high frequency modulation of the limit cycle amplitude. DTIC

DISCRETE MODELS OF THE BOLTZMANN EQUATION: STRUCTURE OF THE COLLISION OPERATOR OF SOUND PROPAGATION [DYSKRETNE MODELE ROWNANIA BOLTZMANNA: STRUKTURA OPERATORA ZDERZENIOWEGO PROPAGACJA DZWIEKU]

Kazimierz Piechor 1992 68 p In POLISH

(IFTR-2/1992) Avail: CASI HC A04/MF A01

Given the extensive range of literature relating to discrete kinetic theory, the discussion of results obtained by other authors was minimized, and primary attention was on such studies as the relation between results obtained in the discrete kinetic theory and corresponding results obtained within the framework of the so-called true kinetic theory based on Boltzmann's complete equation. In the first section, the discrete collision operator is analyzed. The primary conclusion is the statement that in the class of bilinear operators that copy Rn x Rp onto Rp, only operators (1.6), the so-called classical discrete collision operators, are characterized by collision in variants that vanish only for the Maxwellian and solutions of system (1.5) satisfy Statement H. The approximation is axiomatic and the conclusion is constructive. The proposed structure was used to construct discrete models of mixtures of noble gases and gases with binary chemical reactions. Let us consider existing models as such cases. The uniform balance principle largely does not hold for the case of gases in chemical reactions, i.e. forward and reverse reactions do not have equal probabilities. Only in the case of so-called chemical equilibrium can we assume that this principle will hold. Our models require that this principle holds since a classical form of the Maxwellian is used for discrete theory. It is the author's belief that discrete kinetic models can be extended to permit a polymolecular reaction with a different quantity of molecules following the reaction compared to the quantity of molecules prior to the reaction and an exception or even a weakening of the universal balance principle requires a different form of the Maxwellian rather than the classical form and, consequently, a new form of collision operator. Research on nonclassical collision operators continues, while the first incomplete model is the model proposed by the author. Necesary and sufficient results are presented to assure that this discrete model is not trivial, i.e. so system 1.5 and 1.6 does not decompose into multiple independent subsystems.

SOUND EXPOSURE LEVEL PREDICTION FOR IMPULSE SOUND SOURCES ABOVE VARIABLE TERRAIN Final Report

Hong C. Zhuang, Leslie J. Benson, and Michael J. White May 1993 57 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(DA Proj. 4A1-62720-A-896)

(AD-A267535; CERL-TR-EC-93/02) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The influence of the ground surface makes it difficult to calculate the propagation of impulse noise from Army type blasts such as that produced by heavy-weapons fire on training ranges. This study developed the computer program gtdcom, which extends the Geometrical Theory of Diffraction (GTD) propagation model to include realistic, three-dimensional terrain, broadband sounds (blast waves), and frequency weighting factors. This report describes the theoretical basis used to broaden the GTD model, and briefly outlines the use of GTDCOM. The new program was interfaced with the Geographic Resources Analysis Support System (GRASS) to calculate sound exposure levels (SEL's) from blast sources using map elevation contour data. A user specifies the source position of the blast, a charge size, and an expected frequency weighting factor; the program calculates the SEL for each terrain cell, displays the results on the screen, and prepares a contour map for printer output. STRATEGIC PLANNING FOR AIRCRAFT NOISE ROUTE IMPACT ANALYSIS: A THREE DIMENSIONAL APPROACH Final Report, 12 Jul. 1991 - 15 Jan. 1993

C. R. Bragdon, M. J. Rowan, and K. K. Ahuja Sep. 1993 259 p
(Contract NAS1-19061; RTOP 537-03-21-03)
(NASA-CR-191484; A8612-009/1; NAS 1.26:191484) Avail: CASI HC A12/MF A03

The strategic routing of aircraft through navigable and controlled airspace to minimize adverse noise impact over sensitive areas is critical in the proper management and planning of the U.S. based airport system. A major objective of this phase of research is to identify, inventory, characterize, and analyze the various environmental, land planning, and regulatory data bases, along with potential three dimensional software and hardware systems that can be potentially applied for an impact assessment of any existing or planned air route. There are eight data bases that have to be assembled and developed in order to develop three dimensional aircraft route impact methodology. These data bases which cover geographical information systems, sound metrics, land use, airspace operational control measures, federal regulations and advisories, census data, and environmental attributes have been examined and aggregated. A three dimensional format is necessary for planning, analyzing space and possible noise impact, and formulating potential resolutions. The need to develop this three dimensional approach is essential due to the finite capacity of airspace for managing and planning a route system, including airport facilities. It appears that these data bases can be integrated effectively into a strategic aircraft noise routing system which should be developed as soon as possible, as part of a proactive plan applied to our FAA controlled navigable airspace for the United States. NOISE MEASUREMENT FLIGHT TEST OF FIVE LIGHT HELICOPTERS Final Report, Jul. 1991 - May 1993
Edward J. Rickley, Kenneth E. Jones, Amanda S. Keller, and Gregg G. Fleming Jul. 1993 400 p
(AD-A268566; DOTVNTSC-FAA-93-5; DOT/FAA/EE-93-01) Avail: CASI HC A17/MF A04

The U.S. Department of Transportation, Federal Aviation Administration, (U.S.DOT/FAA), along with the U.S.DOT, Research and Special Programs Administration, Volpe National Transportation Systems Center (RSPA/Volpe Center) conducted a helicopter noise measurement flight test in Champaign, Illinois, during the period 22-26 July 1991. The primary objective of the study was to obtain the field data necessary to examine the feasibility of a simplified helicopter-noise-certification procedure (screening test). Acoustic data were measured by and stored on a hand-held sound-level meter (on-line processing) and recorded on digital tape for later off-line processing. A comparison of the measured on-line acoustic data with the acoustic data processed off-line provided the foundation necessary to evaluate the feasibility of the proposed screening test. In addition to acoustic measurements, meteorological data and helicopter tracking and performance data were also obtained. DTIC

NONLINEAR RANDOM RESPONSE PREDICTION USING MSC/NASTRAN
J. H. Robinson, C. K. Chiang (Old Dominion Univ., Hampton, VA.), and S. A. Rizzi Oct. 1993 62 p
(RTOP 505-63-50-10)
(NASA-TM-109029; NAS 1.15:109029) Avail: CASI HC A04/MF A01

An equivalent linearization technique was incorporated into MSC/NASTRAN to predict the nonlinear random response of structures by means of Direct Matrix Abstract Programming (DMAP) modifications and inclusion of the nonlinear differential stiffness module inside the iteration loop. An iterative process was used to determine the rms displacements. Numerical results obtained for validation on simple plates and beams are in good agreement with existing solutions in both the linear and linearized regions. The versatility of the implementation will enable the analyst to determine the nonlinear random responses for complex structures under combined loads. The thermo-acoustic response of a hexagonal thermal protection system panel is used to highlight some of the features of the program. Author

Consequences of the experiments demonstrating non-conservation of spatial and combined (CP) parity are considered. A hypothesis is proposed according to which the results of the experiments do not contradict the mirror symmetry of our World. According to the hypothesis the fundamental particles (quarks and leptons) consist of moving constituents which do not possess charges of any of the three known interactions. Strong, weak, and electromagnetic interactions arise as a result of internal motion of the constituents; on reversal of the direction of this motion, a particle transforms into its antiparticle, whereas spatial inversion transforms usual particles into mirror ones (and vice versa). Consequences of the hypothesis for neutral kaons system are also considered, and some experiments aimed at searching for mirror particles are suggested. DOE

THE QUANTUM MASS SHIFT OF THE SOLITON IN SKYRME MODEL Ph.D. Thesis
Hillel Livne Sep. 1991 92 p In HEBREW
(ITN-93-85219) Copyright Avail: Issuing Activity (Tel-Aviv Univ., Exact Sciences Library, Ramat Aviv 69978, Israel)

Quantum chromodynamics (QCD) is a fundamental field theory describing the strong forces in nature. At present, it is unknown how to calculate the spectrum of the hadrons from QCD in the low energy limit. One of the ways to overcome this difficulty is to use effective models with the same global symmetries as QCD. The Skyrme model represents a class of such models. The Skyrme model is an effective QCD model at the limit of small momenta and large number of colors. Quantities such as the spectrum of the lightest baryons or the isoscalar mean square radius and the magnetic moment of the baryon, were calculated by quantization of rotational zero modes (ZM). In addition, the meson-baryon scattering cross-sections and S-matrix elements were calculated by quantization of the non-ZM up to the second order in the Lagrangian. The contribution of the quantum mass shift from some of the non-ZM to the soliton, was also calculated. It was found that it cannot be neglected when compared with the mass calculated from ZM only. Values calculated via the Skyrme model deviate from experimental values by about 30% and it is, therefore, interesting to ask whether these values could be improved by including the quantum mass contribution from all the non-ZM in the calculations. The quantum mass shift which arises from all non-ZM to the soliton mass in the Skyrme model were calculated. The mass shift does not depend on the baryonic spin, so that it is the same for the nucleon and for the delta.

EFFECTS OF SPIN-ORBIT COUPLING ON DISORDERED MESOSCOPIC SYSTEMS M.S. Thesis
Yuval Oreg Sep. 1991 86 p In HEBREW
(ITN-93-85220) Copyright Avail: Issuing Activity (Tel-Aviv Univ., Exact Sciences Library, Ramat Aviv 69978, Israel)

The effect of spin-orbit interaction on one- and two-dimensional mesoscopic disordered systems is studied in general and in terms of the tight-binding model in particular. It is shown that spin-orbit coupling can be formulated in the non-relativistic limit as a vector potential. By averaging over arbitrarily strong spin-orbit coupling, it is shown that the transmission of a one-dimensional ring, subject to a magnetic flux, contains only the second harmonic of the flux and a constant term (zeroth harmonic). The transverse ('Hall') conductance of a one-dimensional disordered ring is studied as well and it is shown that in the presence of spin-orbit coupling it may change its sign for some values of the flux threading the ring. The analysis of two-dimensional systems, with a well-defined plaquette size, shows that the zeroth and the second harmonics of the flux per plaquette are dominant in the transmission and in the transverse ('Hall') resistance of the sample. For the calculation of transport properties, a closed expression for the scattering matrix of a sample connected to a few wires is derived. The scattering matrix is expressed as a function of (1) the Green's function of the isolated system and (2) the coupling between the system and the wires. Chapters 1, 3 and 5 are devoted to reviews and to rederivation of previous results which provided the motivation for this study and are essential for the thesis. In chapter 2, an intuitive physical approach to the problem of spin-orbit coupling is presented. In chapters 4, 6, and 7, the new results and methods are derived rigorously (analytically and numerically). The last chapter is devoted to summary, specluations and possible continuations of the work. Author (ISA)

THEORETICAL STUDIES RELATING TO THE INTERACTION OF RADIATION WITH MATTER Final Report, 1 Jan. 1991 - 30 Jun. 1993
P. R. Berman 30 Jun. 1993 8 p
(Contract N00014-91-J-1146)
(AD-A267134) Avail: CASI HC A02/MF A01

The final report for Grant No. N00014-91-J7-1146 is divided into seven subject areas as follows: (1) coherent transients using broadband optical pulses; (2) four-wave mixing in magnetically degenerate systems; (3) interpretation of laser cooling mechanisms; (4) laser cooling in one and two dimensions; (5) nonlinear spectroscopy of cold atoms; (6) transient spectroscopy using counterpropagating pulses; and (7) theory of four-wave mixing. A detailed description of the work carried out under this Grant can be found in the articles listed at the end of this report as well as in Annual Reports GAR1 and GAR2 associated with this Grant. In this Final Report, the research areas are summarized briefly, with references to the appropriate articles. DTIC

SHIELDING FROM SPACE RADIATIONS Annual Technical Report, 1 Dec. 1992 - 1 Jun. 1993
C. Ken Chang, Forooz F. Badavi, and Ram K. Tripathi 1993 91 p
(Contract NAS1-1286)
(NASA-CR-194578; NAS 1.26:194578) Avail: CASI HC A05/MF A01

This Progress Report covering the period of December 1, 1992 to June 1, 1993 presents the development of an analytical solution to the heavy ion transport equation in terms of Green's function formalism. The mathematical development results are recasted into a highly efficient computer code for space applications. The efficiency of this algorithm is accomplished by a nonperturbative technique of extending the Green's function over the solution domain. The code may also be applied to accelerator boundary conditions to allow code validation in laboratory experiments. Results from the isotopic version of the code with 59 isotopes present for a single layer target material, for the case of an iron beam projectile at 600 MeV/nucleon in water is presented. A listing of the single layer isotopic version of the code is included. Author

MANY-BODY QUANTUM MECHANICAL STUDIES OF MOLECULAR CLUSTERS Final Report
Rodney J. Bartlett 1 Jun. 1992 21 p
(Contracts N00014-88-J-1046; N00014-91-J-1282)
(AD-A266624) Avail: CASI HC A03/MF A01

The following final report summarizes four years of research for ONR on the topic of 'Many-Body Quantum Mechanical Studies of Molecular Clusters.' There are two primary aspects of this effort, a methodological part focusing on new first principle (i.e. ab initio) multi-reference coupled-cluster methods for obtaining improved solutions to the Schroedinger equation for the structure and spectra of molecular clusters; and applications of these new, coupled-cluster (CC) and many-body perturbation theory (MBPT) methods to several fascinating problems with emphasis on the structure and spectra of carbon clusters and borane (BH3) containing clusters. The substantial accomplishments of this effort are summarized. DTIC

STUDY OF MULTI-DIMENSIONAL RADIATIVE ENERGY TRANSFER IN MOLECULAR GASES
Jiwen Liu and S. N. Tiwari Oct. 1993 71 p
(Grant NAG1-363)
(NASA-CR-194613; NAS 1.26:194613; ODU/ICAM-93-102) Avail: CASI HC A04/MF A01

The Monte Carlo method (MCM) is applied to analyze radiative heat transfer in nongray gases. The nongray model employed is based on the statistical arrow band model with an exponential-tailed inverse intensity distribution. Consideration of spectral correlation results in some distinguishing features of the Monte Carlo formulations. Validation of the Monte Carlo formulations has been conducted by comparing results of this method with other solutions. Extension of a one-dimensional problem to a multi-dimensional problem requires some special treatments in the Monte Carlo analysis. Use of different assumptions results in different sets of Monte Carlo formulations. The nongray narrow band formulations provide the most accurate results. Author (revised)

INVESTIGATION OF THE INTERACTIONS OF RADIATION WITH MATTER Final Report, 1 Mar. 1990 - 28 Feb. 1993
Steven T. Manson 31 May 1993 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DAAL03-89-K-0098)
(AD-A266743; ARO-26709.13-PH) Avail: CASI HC A02

Theoretical studies of the interaction of charged particles and electromagnetic radiation with matter have been performed. Particular emphasis has been given to ionizing radiation and the details of energy deposition by the radiation. New phenomena have been discovered in the area of ionization in ion-atom and atom-atom collisions. Models of electron impact ionization of atoms and molecules have been extended to the relativistic range. In addition, relativistic effects in the photoionization of very heavy atoms and ions have been delineated in detail for the first time. Finally, a number of investigations of various aspects of photoionization of excited atoms have been carried out which have given new insight into the process, both for outer and inner shell ionization. Of particular interest is the discovery that inner shell photoionization of excited atoms is primarily a many-body process. DTIC

ON THE 17-keV NEUTRINO
A. Hime Apr. 1993 17 p Presented at the 5th International Workshop on Neutrino Telescopes, Venice, Italy, 2-4 Mar. 1993
(Contract W-7405-eng-36)
(DE93-012638; LA-UR-93-1348; CONF-9303160-1) Avail: CASI HC A03/MF A01

A brief review on the status of the 17-keV neutrino is presented. Several different experiments found spectral distortions which were consistently interpreted as evidence for a heavy neutrino admixture in beta decay. Recent experiments, however, rule out the existence of a 17-keV neutrino as well as escape criticisms of earlier null results. Moreover, the majority of positive results have been reinterpreted in terms of instrumental effects, despite the need for a different explanation in each case. Anomalies persist in the low energy region of the tritium spectrum which deserve further investigation. DOE

MOLECULAR BEAM STUDIES OF REACTION DYNAMICS
Yuan T. Lee Mar. 1993 7 p Presented at the 15th Combustion Research Contractors' Meeting, Lake Harmony, PA, 2-4 Jun. 1993
(Contract DE-AC03-76SF-00098)
(DE93-015035; LBL-33919-ABS; CONF-9306172-1) Avail: CASI HC A02/MF A01

The major goal of this research is to elucidate simple elementary reactions and to unravel mechanism of complex/photochemical reactions. Molecular beams are used to study reactions between molecules or to monitor photodissociation events in a collision-free environment. Recent activities centered on reactions involving oxygen atoms with unsaturated hydrocarbons, endothermic substitution reactions, dependence of reactivity of excited atoms on alignment of excited orbitals, photochemical reactions of polyatomic molecules, energy transfer, free radicals in combustion processes, infrared absorption spectra of carbonium ions and hydrated hydronium ions, and bond-selective photodissociation. RELATIVISTIC MEAN-FIELD CALCULATIONS OF LAMBDA AND SIGMA HYPERNUCLEI
N. K. Glendenning, D. VonEiff, M. Haft, H. Lenske, and M. K. Weigel 24 Oct. 1992 19 p
(Contract DE-AC03-76SF-00098)
(DE93-015269; LBL-33031) Avail: CASI HC A03/MF A01

Single-particle spectra of lambda and sigma hypernuclei are calculated within a relativistic mean-field theory. The hyperon couplings used are compatible with the lambda binding in saturated nuclear matter, neutron-star masses, and experimental data on lambda levels in hypernuclei. Special attention is devoted to the spin-orbit potential for the hyperons and the influence of the rho-meson field (isospin dependent interaction). DOE

CONFINEMENT AND STABILITY OF A CRYSTAL BEAM
A. G. Ruggiero 1993 4 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contract DE-AC02-76CH-00016)
(DE93-015400; BNL-48373; CONF-930511-152) Avail: CASI HC A01/MF A01

The following is an analysis of the confinement and stability issues of a Crystal Beam. A method is described to determine the equilibrium configuration of a beam of highly charged particles. It is required that the beam has a uniform distribution in the direction of motion, which is stable and does not need therefore confinement with external means. It is shown that this can be obtained only for a relatively longitudinally compact beam. Confinement in the plane transverse to the direction of motion is obtained with external means, which also provide stability. It is important that particles are distributed so that the resulting space charge forces are linear with respect to the particle transverse coordinates. DOE

NEGATIVE ION FORMATION IN SMALL CARBON CLUSTERS
H. S. Carman, Jr. and R. N. Compton 1993 7 p Presented at the 2nd International Conference on Laser Ablation, Knoxville, TN, 19-22 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015436; CONF-9304144-3) Avail: CASI HC A02/MF A01

Laser ablation of graphite into a rare gas supersonic jet has been used to generate C(sub m) clusters (both neutral and ionic) in the size range m less than or equal to 30. Negative ions produced by three different mechanisms have been studied: ion formation during the ablation process, low energy electron attachment (Rydberg electron transfer) to neutral clusters, and charge transfer from ground state rubidium atoms to neutral clusters. The C(sub m)(sup (minus)) distributions observed for the three cases are distinctly different, providing insights into the structures, stabilities, and electron attachment dynamics of small carbon clusters. THE INTERACTION OF HCN(DCN) WITH Si(111)-7X7 STUDIED WITH HREELS, UPS, AND XPS Technical Report
Y. Bu, L. Ma, and M. C. Lin 1993 24 p
(Contract N00014-89-J-1235)
(AD-A266237; TR-19) Avail: CASI HC A03/MF A01

The interaction of HCN (DCN) with Si(111)-7x7 was studied with high resolution electron energy loss spectroscopy (HREELS), ultra-violet photo-electron spectroscopy (UPS), and X-ray photoelectron spectroscopy (XPS). HCN (DCN) formed dimers and/or polymers on the surface at 100 K with higher dosages (D greater than 4 L). Above 200 K, CN radicals in an end-on adsorption geometry were identified as the major species which survived up to 600 K on the surface. This observation was different from that with HCN (DCN) on Si(100)-2x1, where the relative concentration of the HCNH species was higher. The observed difference in the behavior of HCN (DCN) on Si(111)-7x7 and Si(100)-2x1 could be ascribed to the different topologies of the two surfaces. DTIC

PHENIX CONCEPTUAL DESIGN REPORT
29 Jan. 1993 480 p
(Contract DE-AC02-76CH-00016)
(DE93-015759; BNL-48922) Avail: CASI HC A21/MF A04

The PHENIX Conceptual Design Report (CDR) describes the detector design of the PHENIX experiment for Day-1 operation at the Relativistic Heavy Ion Collider (RHIC). The CDR presents the physics capabilities, technical details, cost estimate, construction schedule, funding profile, management structure, and possible upgrade paths of the PHENIX experiment. The primary goals of the PHENIX experiment are to detect the quark-gluon plasma (QGP) and to measure its properties. Many of the potential signatures for the QGP are measured as a function of a well-defined common variable to see if any or all of these signatures show a simultaneous anomaly due to the formation of the QGP. In addition, basic quantum chromodynamics phenomena, collision dynamics, and thermodynamic features of the initial states of the collision are studied. To achieve these goals, the PHENIX experiment measures lepton pairs (dielectrons and dimuons) to study various properties of vector mesons, such as the mass, the width, and the degree of yield suppression due to the formation of the QGP. The effect of thermal radiation on the continuum is studied in different regions of rapidity and mass. The e(mu) coincidence is measured to study charm production, and aids in understanding the shape of the continuum dilepton spectrum. Photons are measured to study direct emission of single photons and to study (pi)(sup 0) and (eta) production. Charged hadrons are identified to study the spectrum shape, production of antinuclei, the (phi) meson (via K(sup +)K(sup -) decay), jets, and two-boson correlations. The measurements are made down to small cross sections to allow the study of high p(sub T) spectra, and J/(psi) and (upsilon) production. The PHENIX collaboration consists of over 300 scientists, engineers, and graduate students from 43 institutions in 10 countries. This large international collaboration is supported by U.S. resources and significant foreign resources. DOE

STRUCTURAL EFFECTS IN ELECTRON TRANSFER REACTIONS: COMPARATIVE INTERFACIAL ELECTROCHEMICAL KINETICS FOR CIS- VERSUS TRANS-DIOXORHENIUM (V) (BI)PYRIDINE OXIDATION Technical Report, Jul. 1992 - Jul. 1993
Xiao L. Zhang, Joseph T. Hupp, and Gerald D. Danzer 29 May 1993 26 p
(Contract N00014-91-J-1035)
(AD-A266307; TR-14) Avail: CASI HC A03/MF A01

We have been exploring the proton-coupled reductions of various dioxorhenium (5) species because of the more general insights they provide into the kinetics and thermodynamics of multielectron transfer processes. The rhenium (5) complexes are also amenable, however, to proton-decoupled one-electron oxidation--both optically (via metal-to-ligand charge-transfer excitation) and electrochemically. Our prior studies of electron transfer (ET) thermodynamics revealed a strong dependence of the Re (6/5) formal potential on ligand substituent characteristics (most notably, substituent electron donating or withdrawing characteristics). The studies also showed--independent of ligand substituent identity--a strong dependence of E(sub f) on isomeric form cis versus trans coordination geometry. In all cases the cis form was more easily oxidized than the corresponding trans, generally by about 600mV. DTIC

N94-16586# SRI International Corp., Menlo Park, CA.
DISSOCIATION RATES OF DIATOMIC MOLECULES Final Report, 15 Sep. 1985 - 15 May 1992
Philip C. Cosby and Hanspeter Helm Dec. 1992 233 p
(Contract F33615-85-C-2560)
(AD-A266464; SRI-PYU-1147/MP-92-280; WL-TR-93-2004) Avail: CASI HC A11/MF A03

Absolute cross sections were measured for the electron-impact dissociation of simple molecules using a novel fast beam technique with multicoincident detection of the dissociation fragments. Translational energy released in the dissociation and product mass ratios were explicitly measured, allowing a detailed understanding of the dissociation mechanisms. The technique was applied to the molecules of nitrogen, oxygen, carbon monoxide, carbon dioxide, nitrogen dioxide, chlorine, and other molecules.

A detailed description of the measurement technique is presented together with the measured data. DTIC

A MOLECULAR DYNAMICS SIMULATOR FOR OPTIMAL CONTROL OF MOLECULAR MOTION Final Report, 1 Oct. 1991 - 31 Mar. 1993
Herschel Rabitz 18 Jun. 1993 19 p
(Contract DAAL03-91-G-0012)
(AD-A266572; ARO-28555.1-CH) Avail: CASI HC A03/MF A01

This report presents results of a Molecular Dynamics Simulator (MDS) used to explore optimal control of molecular motion. A realistic model of an interatomic potential is created by a configuration of magnets. This simulated potential approximately models both the short and long range portions of true molecular potentials. Atoms within a polyatomic molecule are simulated using carts which float on an airtrack, and a mechanical driver simulates the action of a controlling laser. In analogy with a molecular system, the potential is determined by analysis of a series of dynamics experiments. Knowledge of the potential, combined with optimal control theory, enables the design of the driver motion necessary to achieve controlled dissociation. Successful control requires overcoming a variety of difficulties analogous to those expected to be faced in the control of true molecular systems. The MDS provides insight into factors affecting the molecular control by demonstrating a real-time simulation of laser-controlled molecular dynamics. DTIC

NEUTRINO MASS AND MIXING: SUMMARY OF THE NEUTRINO SESSIONS
T. J. Bowles 1993 25 p Presented at the 13th Moriond Workshop on Perspectives in Neutrinos, Atomic Physics, and Gravitation, Villars-sur-Ollon, Switzerland, 30 Jan. - 6 Feb. 1993
(Contract W-7405-eng-36)
(DE93-014342; LA-UR-93-2006; CONF-930187-3) Avail: CASI HC A03/MF A01

A great deal of experimental and theoretical effort is underway to use neutrinos as a probe for Physics Beyond the Standard Model. Most of these efforts center on the questions of the possible existence of non zero neutrino mass and mixing. Sessions at the Moriond conferences have dealt with these questions at most of the meetings during the last several years and this year was no exception. Presentations covering most of the current and planned research in this field were presented and discussed. Although there is, at present, no definitive evidence for a non zero neutrino mass and mixing, several unresolved problems (in particular solar neutrinos) do seem to be indicating the likely existence of new neutrino properties. It is likely that before the end of this decade, efforts now being initiated will be able to determine whether or not the hints we are now seeing are really due to new physics. DOE

FUNDAMENTAL-MODE RF DESIGN IN e(+)e(-) STORAGE RING FACTORIES
P. B. Wilson Mar. 1993 10 p Presented at the Joint US/CERN School on Particle Accelerators Frontiers of Particle Beams: Factories with e(+)e(-) Rings, Benalmadena, Spain, 28 Oct. - 5 Nov. 1992
(Contract DE-AC03-76SF-00515)
(DE93-015249; SU-SLAC-PUB-6062; CONF-9210313-3) Avail: CASI HC A02/MF A01

The difficulties arising in the design of the RF system for a factory-type storage ring lie mainly in two areas. First, a gap in the circulating beam current is required for ion clearing. Because of the high beam loading current, this gap produces a strong transient variation in the RF cavity voltage, which can in turn lead to a significant shift in the synchronous phases between bunches on either side of the gap. This phase shift would produce an unacceptable shift in the collision point, unless compensated by a corresponding shift in the bunch phases in the other ring. In order to work out the details of this compensation, the transient beams loading effects produced by the gap must be calculated quite carefully. A major goal of this chapter is to provide the insight and the basic analytic tools necessary for this analysis. The second major problem for the fundamental mode RF design is also a consequence of the high average current needed for a storage ring particle factory: longitudinal multibunch beam instabilities at sideband frequencies within the passband of the accelerating mode. These instabilities can be damped by an appropriate feedback system, as discussed elsewhere in these proceedings. However, as background for this problem, we need to understand the phase and amplitude variations produced in the cavity voltage when the bunches undergo small-amplitude synchrotron oscillations. In the final section, the cavity voltage variation induced by such oscillations is calculated and applied to compute the Robinson damping time. The emphasis throughout this paper will be to provide a thorough understanding of beam loading effects. DOE

N94-16811# Stanford Linear Accelerator Center, CA.
APPLICATION OF CYLINDRICAL DISTRIBUTION FUNCTIONS TO ANISOTROPIC SCATTERING FROM AMORPHOUS FILMS
M. J. Regan and A. Bienenstock Apr. 1993 5 p Presented at the 9th International Conference on Small-angle Scattering, Saclay, France, 27-30 Apr. 1993
(Contract DE-AC03-76SF-00515)
(DE93-015256; SU-SLAC-PUB-6140; SLAC/SSRL-0011; CONF-9304155-1)
Avail: CASI HC A01/MF A01

The cylindrical pair correlation function has been utilized as a structural tool in the study of anisotropic phase separation in magnetron-sputtered amorphous Fe(x)Ge(100-x) films. Anomalous small-angle x-ray scattering (ASAXS) measurements have been performed with the scattering vector both in and oblique to the plane of the films, to search for anisotropy. The cylindrical correlation function has been calculated from these measurements, and indicates that there exist well-defined regions of electron density that are elongated (7 A by 12 A) in the direction of film growth. In addition, for a composition of x = 6, these regions are well-correlated on a length scale of 27 A for those correlation vectors oriented in the plane of the film surface, whereas the correlations are far weaker and longer in length for those vectors aligned in the direction of growth. These results are in agreement with a previous qualitative model of packed, prolate ellipsoids oriented in the direction of growth. DOE

ATOMIC PROCESSES IN HYDROGEN AND DEUTERIUM NEGATIVE ION DISCHARGES
J. R. Hiskes Nov. 1992 14 p Presented at the Production and Neutralization of Negative Ions and Beams, Upton, NY, 9-13 Nov. 1992
(Contract W-7405-eng-48)
(DE93-013432; UCRL-JC-112220; CONF-921145-7) Avail: CASI HC A03/MF A01

A knowledge of the atomic processes active in a hydrogen negative ion discharge and their respective rates is an essential component of the interpretation, modeling, and enhancement of negative ion systems. The generation of the cross sections and rate processes appropriate to this problem has been a principal activity at several laboratories. In this paper is discussed those collision processes that are of major importance for the destruction of the vibrationally excited molecules generated in the discharge, processes that are essential to the valuation of the optimization procedure that is discussed in this paper. FEMTOSECOND GROWTH DYNAMICS OF AN UNDERDENSE IONIZATION FRONT MEASURED BY SPECTRAL BLUESHIFTING
W. M. Wood, C. W. Siders, and M. C. Downer 1993 53 p
(Contract DE-FG05-92ER-40739)
(DE93-013582; DOE/ER-40739/T1) Avail: CASI HC A04/MF A01

A comprehensive report of time-resolved spectral blue shifts of 100-femtosecond laser pulses caused by ionization of atmospheric density N(sub 2) and noble gases subjected to high (10(sup 14) W/cm(sup 2) - 10(sup 16) W/cm(sup 2)) light intensities is presented. Included are data for two experiments: (1) self-shifting of the ionizing laser pulses for varying peak intensities, pressures (1-5 atm.), and gas species; and (2) time-resolved blueshifts of a weak copropagating probe pulse for the same range of ionization conditions. The self-shift data reveal a universal, reproducible pattern in the shape of the blueshifted spectra: as laser intensity, gas pressure, or atomic number increase, the self-blueshifted spectra develop from a near replica of the incident pulse spectrum into a complex structure consisting of two spectral peaks. The time-resolved data reveal different temporal dependence for each of these two features. A quantitative model for a simplified cylindrical focal geometry is presented which explains the

presence of the two spectral features in terms of two distinct ionization mechanisms: collisionless tunneling ionization, which dominates early in the ionizing pulse profile, and electron impact ionization, which dominates during the intense maximum of the ionizing pulse. Transient resonant enhancements may also contribute to ionization near the peak of the pulse. DOE

N94-16826# Brookhaven National Lab., Upton, NY.
EVOLUTION OF HADRON BEAMS UNDER INTRABEAM SCATTERING
Jie Wei 1993 4 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contract DE-AC02-76CH-00016)
(DE93-014330; BNL-48384; CONF-930511-71) Avail: CASI HC A01/MF A01

Based on assumptions applicable to many circular accelerators, we simplify into analytical form the growth rates of a hadron beam under Coulomb intrabeam scattering (IBS). Because of the dispersion that correlates the horizontal closed orbit to the momentum, the scaling behavior of the growth rates are drastically different at energies low and high compared with the transition energy. At high energies the rates are approximately independent of the energy. Asymptotically, the horizontal and longitudinal beam amplitudes are linearly related by the average dispersion. At low energies, the beam evolves such that the velocity distribution in the rest frame becomes isotropic in all the directions. DOE

THE STABILITY OF IONS IN A STORAGE RING IN THE PRESENCE OF SMALL GAP INSERTION DEVICES
E. Bozoki 1993 4 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contract DE-AC02-76CH-00016)
(DE93-015387; BNL-48965; CONF-930511-153) Avail: CASI HC A01/MF A01

With more and more insertion devices in storage rings, where the vacuum chamber size can be suddenly different, ionization pockets may develop, thus ions may be trapped leading to beam blow up, beam instabilities or even beam loss. One has to take a closer took at the stability conditions of the ions in these longitudinal equidistant bunches: are the ions above or below the Ac critical mass? For a bunch tram followed by a gap: is the ion of mass A stable or unstable for a given current at a given azimuthal location in the ring? Are the ions longitudinally mobile and able to get to an unstable region? If the ions proved to be stable in that region and if their longitudinal energy is less then the depth of the potential well, then they have to be statically cleared at that location. We are going to investigate the question of ion stability in the NSLS X-ray ring with a .32 m long variable gap (4-18 mm) undulator and a .95 m long 27 mm gap undulator in it. We will concentrate our attention to CO ions (A=28) since they are the most bothersome in the ring. We will show the effect of gap in the bunch train, the effect of nonlinearity in the beam kicks and the effect of restricted longitudinal mobility of ions. The methods used and the calculations performed are general enough to be applied to any other storage ring or accelerator, thus representing general interest. DOE

NEUTRON AND X RAY SCATTERING STUDIES OF (FeF2)(SUB m)(CoF2)(SUB n) MULTILAYERS
D. Lederman (California Univ., San Diego, La Jolla.), D. P. Belanger (California Univ., Santa Cruz.), J. Wang (California Univ., Santa Cruz.), and S. J. Han (California Univ., Santa Cruz.) 1993 7 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 12-16 Apr. 1993
(Contracts DE-AC05-84OR-21400; DE-FG03-87ER-45324)
(DE93-015809; CONF-930405-24) Avail: CASI HC A02/MF A01

We have performed elastic neutron scattering measurements of the staggered magnetization in (FeF2)(sub m)(CoF2)(sub n) superlattices. Thermal expansion measurements, which are proportional to the magnetic contribution to the specific heat, were also carried out using high resolution x-ray diffraction. One of the two measured samples has thicknesses of m = n = 4.5 and the other m = 26 and n = 28 monolayers, as determined from high angle x-ray theta - 2(theta) scans. In the m = n = 4.5 sample, only one transition is observed at T(sub N) = 62.9 K. Analysis of the neutron data, including the rounding effects, indicates an effective beta approximately equal to 0.42. This does not compare well with the 3D Ising exponent beta = 0.325. The X-ray data also shows the existence of only one specific heat anomaly at T = 62.8 K. For the m = 26, n = 28 sample, dips in the staggered magnetization, and peaks in the thermal expansion were observed at T approximately equal to 40 K and 74 K. The higher temperature anomaly, associated primarily with the FeF2 layers, is sharper than the lower one, which is presumably rounded by the staggered ordering field imposed by the long range order in the FeF2 regions on the CoF2 regions. SIX DIMENSIONAL TRACKING SIMULATOR FOR H(-) INJECTION IN AGS BOOSTER
S. Y. Lee and S. Tepikian 27 Apr. 1993 6 p
(Contract DE-AC02-76CH-00016)
(DE93-015396; BNL-48950; AGS/AD-93-7) Avail: CASI HC A02/MF A01

The effect of Coulomb multipole scattering on the beam emittance is studied with the 6 dimensional injection program ARCHSIM by A. Thiessen. Since the energy loss due to Bhabha scattering is small, the six dimensional simulation can be approximated into transverse 4 dimensional and longitudinal 2 dimensional tracking. The emittance growth agrees well with the multiple scattering theory. The beam loss occurs mainly in the adiabatic capture process in the longitudinal phase space. DOE

EMITTANCE AND BEAM SIZE DISTORTION DUE TO LINEAR COUPLING
G. Parzen 1993 4 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contract DE-AC02-76CH-00016)
(DE93-015402; BNL-48269; CONF-930511-154) Avail: CASI HC A01/MF A01

At injection, the presence of linear coupling may result in an increased beam emittance and in increased beam dimensions. Results for the emittance in the presence of linear coupling will be found. These results for the emittance distortion show that the harmonics of the skew quadrupole field close to (nu)(sub x) + (nu)(sub y) are the important harmonics. Results will be found for the important driving terms for the emittance distortion. It will be shown that if these driving terms are corrected, then the total emittance is unchanged, (var epsilon)(sub x) + (var epsilon)(sub y) = (var epsilon)(sub 1) + (var epsilon)(sub 2). Also, the increase in the beam dimensions will be limited to a factor which is less than 1.414. If the correction is good enough, one can achieve (var epsilon)(sub 1) = (var epsilon)(sub x), (var epsilon)(sub 2) = (var epsilon) where (var epsilon)(sub 1), (var epsilon)(sub 2) are the emittances in the presence of coupling, and the beam dimensions are unchanged. Global correction of the emittance and beam size distortion appears possible. DOE

A HIGH SENSITIVITY SEARCH FOR CP VIOLATING RARE K(SUB L) DECAYS AND PRECISION MEASUREMENT OF THE DIRECT CP VIOLATION PARAMETER (EPSILON)(PRIME)/(EPSILON) VIA THE FOUR K (YIELDS) 2(PI) DECAY MODES
Yau W. Wah May 1993 8 p
(Contract DE-FG02-90ER-40560)
(DE93-016866; DOE/ER-40560/4J) Avail: CASI HC A02/MF A01

Fermilab experiments E731, E773, E799, and E832 are a series of experiments to investigate the physics of CP violation, CPT violation, and rare decays of the neutral kaon system. E731 finished data taking in 1988; during the past year the full data set analysis was completed and yielded ((epsilon)(sup prime) / (epsilon)) (sub (2 x pi)) = (7.4 plus or minus 5.2 (stat) plus or minus 2.9 (syst)) x10(sup -4). The value favors a high top quark mass value within the Standard Model. E773 tests CPT violation by determining (Delta-phi)(sub (2 x pi)) with an accuracy of about 0.5(sup 0). Data were taken during the last Fermilab Fixed Target run period between September and November 1991. It is anticipated the data analysis will be finished within a year. E799, with the primary goal of observing direct Cp violation via searching for the rare decay K(sub L) yields (pi)(sup 0) l(sup +) l(sup -) (where l = e, mu, nu) took test data between November 1991 and January 1992 (Phase 1). Some preliminary

results are shown here. E799 (Phase II) and E832 (a follow up experiment of E731) are scheduled to take data after the current Fermilab collider run with a new facility and detector. DOE

NEUTRAL-CURRENT DETECTION IN THE SUDBURY NEUTRINO OBSERVATORY
T. J. Bowles, P. J. Doe, M. M. Fowler, A. Hime, R. G. H. Robertson, P. M. Thornewell, J. B. Wilhelmy, J. F. Wilkerson, and J. M. Wouters 1993 9 p Presented at the 13th Moriond Workshop on Perspectives in Neutrinos, Atomic Physics, and Gravitation, Villars-sur-Ollon, Switzerland, 30 Jan. - 6 Feb. 1993
(Contract W-7405-eng-36)
(DE93-014481; LA-UR-93-1855; CONF-930187-4) Avail: CASI HC A02/MF A01

The Sudbury Neutrino Observatory (SNO) will have the capability of detecting all active species of neutrinos with energies greater than 2.2 MeV by the neutral-current disintegration of deuterium. The comparison of this rate with the rate of inverse beta decay of the deuteron will yield a nearly model-independent answer to the question of whether electron neutrinos from the sun oscillate into mu or tau neutrinos. The signal of a neutral-current interaction is the liberation of a free neutron in the heavy-water detector, and we discuss a technique employing He-3 proportional counters for registering these neutrons, particularly from the standpoint of the ultra-low backgrounds needed. HEAVY ION PHYSICS RESEARCH AT CREIGHTON UNIVERSITY
M. Cherney 1992 8 p
(Contract DE-FG02-91ER-40652)
(DE93-016809; DOE/ER-40652/2) Avail: CASI HC A02/MF A01

This research continues the baseline efforts in the investigation of the behavior of hadronic matter under extreme conditions. The project is concerned with the search for indications of a phase transition from hadronic to quark matter in the STAR, NA44, and NA36 experiments. It is believed that the conditions necessary for the formation of this quark-gluon plasma include large energy densities over extended volumes. These large energy densities may be produced in heavy ion interactions. The technique of boson interferometry may prove to be an effective tool in verifying the existence of a quark-gluon plasma. The measurement of enhanced strangeness production may also provide an indication of plasma formation. This project contributes to the development of a slow control system and time projection chamber tracking for the STAR experiment, upgrades for the NA44 experiment at CERN through studies of a spot focusing Cherenkov-detector, and the remaining analysis of data collected with the NA36 experiment at CERN. MESONS AT FINITE TEMPERATURE IN THE NJL MODEL WITH GLUON CONDENSATE
D. Ebert, Yu. L. Kalinovskij, and M. K. Volkov 1992 10 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-626697; JINR-E-2-92-268) Avail: CASI HC A02 (US Sales Only)

The QCD-motivated NJL-model with gluon condensate is studied at finite temperature and baryon number density. We investigate the behavior of the constituent quark mass, quark condensate, meson masses, F(sub (pi)), coupling constants g(sub (pi)qq-bar), g(sub (sigma)qq-bar) and Z as function of temperature T. It is shown that the gluon condensate plays a stabilizing role for behavior of different physical quantities when temperature changes. DOE

LINEAR CHARACTERISTIC SPATIAL QUADRATURE FOR DISCRETE ORDINATES NEUTRAL PARTICLE TRANSPORT ON ARBITRARY TRIANGLES Ph.D. Thesis
Dennis J. Miller Jun. 1993 135 p
(AD-A267485; AFIT/DS/ENP/93-02) Avail: CASI HC A07/MF A02

A new discrete ordinates spatial quadrature for arbitrary triangular cells is derived and compared to its rectangular cell linear characteristic counterpart. The triangular mesh is more flexible, allowing curved surfaces and off-axis angles to be approximated with many fewer spatial cells. The triangle method is consistently more accurate on example problems tested here. Arbitrary orientation and size of the triangles allow non-patterned meshes to be developed which appears to ameliorate numerical diffusion. The triangle linear characteristic quadrature converges at nearly the same rate as rectangular Linear characteristic on Lathrop's problem. Mesh sensitivity measurements show large variations in triangle vertex locations produce less than 1.0 percent variation in results. Test cases included a rectangular region with diagonal vacuum duct, and cylindrical source region with rotated rings of annular segmented reflectors. The triangle linear characteristic quadrature is more cost effective on these problems achieving a relative error of less than 1.0 percent with a factor of three to over a hundred fewer spatial cells, with less than three times the computational

cost per cell. This spatial cell savings should increase the practical problem domain for which discrete ordinates is usable. DTIC

ATOMIC BEAM STUDIES RELEVANT TO THE SPACE ENVIRONMENT Final Report, 1 Dec. 1989 - 31 Mar. 1993
Robert C. Amme 31 Mar. 1993 22 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0119-90)
(AD-A268628; AFOSR-93-0621TR) Avail: CASI HC A03

This final report describes the development, testing, and utilization of an atomic oxygen beam apparatus, capable of energies ranging from approximately 4 eV to over 500 eV. The technique employed is that of creating a beam of negative oxygen ions, typically from electron impact on N2O, then focusing and deceleration with subsequent electron photodetachment employing an argon-ion laser cavity with boosted power. Up to 30% of the ion beam may be photodetached at maximum laser powers, producing approximately 50 na of equivalent neutral flux. Angular divergence and energy spread are both well controlled and the total beam intensity is known to about 3 to 5%. Higher beam fluxes may be attained, but at the cost of filament and laser window lifetimes. Several measurements are described employing the beam apparatus in conjunction with a high stability quartz crystal mass monitor. Capabilities of the system have been demonstrated for studies of erosion, secondary charged particle production, and related work. DTIC

CATHODE SHEATH CHARGE TRANSFER EFFECTS Final Report, 10 Jun. 1987 - 28 Mar. 1993
H. H. Michels and R. H. Hobbs Mar. 1993 126 p
(Contract F33615-87-C-2718)
(AD-A268393; UTRC-927703-1; WL-TR-93-2071) Avail: CASI HC A07/MF A02

The United Technologies Research Center, under Contract No. F33615-87-C-2718, has carried out a theoretical research investigation of ion-molecule reactions that take place in the sheath region of low pressure discharges in silane gas mixtures. Of particular interest were the dissociative charge transfer mechanism(s) and energy dependent reaction rates of electrons, H(+), H(-), H(3+) and several noble gas ions (He+, Ne+, Ar+) in collisions with silane (SiH4). Such reactions are an important component in the modeling of plasma-processing discharges for producing device-quality silicon films and a detailed understanding of their kinetics is required. Similar ion-molecule reactions with methane and other lower member alkanes have proven to be of importance in the analysis of hydrocarbon combustion. The results of this theoretical investigation furnish fundamental data and provide a better understanding of the role of ion collision-induced molecular decomposition. The initial program for the research effort under this contract was formulated into three phases. Phase 1 consisted of a critical examination of available theoretical methods, including R-matrix methods, that are applicable to the prediction of the rates of dissociative charge transfer in ion-molecule collisions. These studies resulted in the development of an improved R-matrix code which incorporated analysis of reaction products. DTIC

STUDY OF BRIGHTNESS AND CURRENT LIMITATIONS IN INTENSE CHARGED PARTICLE BEAMS Progress Report, 1 Jul. 1992 - 30 Jun. 1993
M. Reiser and S. Guharay 30 Jun. 1993 87 p
(Contract N00014-90-J-1913)
(AD-A268283) Avail: CASI HC A05/MF A01

Over the past several years of ONR support for our research program we have mainly studied the various schemes for intense, high-brightness H(-) beam transport and focusing in the context of its application in space defense. Detailed theoretical studies revealed that the conventional gas focusing system is not suitable as a low-energy beam transport (LEBT) system and also that there are too many unknown parameters to model accurately the behavior of partially charge-neutralized particle beams. We concluded that the electrostatic quadrupole lens system will be a good choice. We have developed a large number of simulation codes and also accessed into the existing codes in the accelerator community (e.g., PARMILA, SNOW-2D, PARMTEQ, etc.) to strengthen our analysis. During the 1992-93 contract period we focused our attention to the experimental activities on H(-) beam characterization and on the installation of a LEBT system for beam transport experiments. We have simultaneously improved our code by incorporating many practical features that we encountered during the analysis of experimental data. We have studied H(-) beams from two types of ion sources: a volume ionization type and a magnetron type source. One of the major problems in this work is to transform a highly diverging beam from the source into a highly converging one so that the output beam from the LEBT can be matched into the acceptance ellipse of an RFQ. Furthermore, the emittance budget is quite restricted. DTIC

EXISTENCE OF A NEW INSTANTON IN CONSTRAINED YANG-MILLS-HIGGS THEORY
F. R. Klinkhamer Mar. 1993 42 p Sponsored by Royal Netherlands Academy of Arts and Sciences Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(NIKHEF-H/93-02; ETN-93-94824) Avail: CASI HC A03

The goal of the study is to discover possible new four dimensional euclidean solutions (instantons) in fundamental supersymmetry SU(2) Yang-Mills-Higgs theory, with a constraint added to prevent collapse of the scale. It is shown that there exists one particular new constrained instanton (I star) with vanishing Pontryagin index. This is based on a topological argument that involves the construction of a noncontractible loop of four dimensional configurations with a certain upperbound on the action, which were established numerically. I star is expected to be the lowest action nontrivial solution in the vacuum sector of the theory. There also exists a related static, but unstable, solution, the new sphaleron. Possible applications of I star to the electroweak interactions include the asymptotics of perturbation theory and the high energy behavior of the total cross section. ESA

SEARCH FOR THE TOP QUARK FROM (e(MU)) AND (e,e) EVENTS IN THE D0 DETECTOR IN p(BAR-p) COLLISIONS AT THE SQUARE ROOT OF s = 1.8 TeV
R. Raja 3 Jun. 1993 20 p Presented at the 1993 Recontres De Physique De La Vallee D'Aoste, LaThuile, Italy, 8-13 Mar. 1993

(Contract DE-AC02-76CH-03000)
(DE93-016350; FNAL/C-93/143-E; CONF-9303172-2) Avail: CASI HC A03/MF A01

We present results from searches for top quark production in p(bar p) collisions at the Tevatron collider based on an integrated luminosity of 7.5 pb(sup -1) obtained during the 1992-1993 run. The present results are confined to decay modes where both the top and anti-top quarks in the event decay semi-leptonically to the ee and e(mu) channels. A lower limit of 103 (99) GeV/c(exp 2) is obtained at 95% confidence level for the top quark mass from the absence of events consistent with standard model top quark decays with background subtraction (no background subtraction). We do, however, observe one event in the e(mu) channel which cannot be explained by the known backgrounds. While we make no claim that this event is due to top quark decay, it is not inconsistent with a top quark mass in the range 130-170 GeV/c exp 2. DOE

GRANULAR FLUCTUATIONS IN PLASMA TURBULENCE AND THEIR ROLE IN TRANSPORT
P. W. Terry Apr. 1993 17 p Presented at the Interdisciplinary Workshop on Statistical Description of Transport in Astro- and Nuclear Physics, Les Houches, France, 2-11 Feb. 1993
(Contract DE-FG02-89ER-53291)
(DE93-013465; DOE/ER-53291/217; CONF-9302117-1) Avail: CASI HC A03/MF A01

Three general types of granular or discrete fluctuations in plasma turbulence are reviewed, with emphasis placed on their unique role in fluctuation-induced transport. These fluctuations are clumps, holes, and vortices, and represent structures that are not part of the normal mode response, the basis of conventional descriptions of plasma turbulence and transport. These fluctuations interact with the normal mode response to produce profound modifications of transport. The self-consistent linking of fields and particle distributions through quasineutrality and Ampere's law is shown to be crucial in calculating these modifications. In particular, it is pointed out that collisionless electron motion along perturbed magnetic fields produces almost no transport of field aligned current across equilibrium surfaces. It is also shown that clumps are granular structures which are turbulently mixed, whereas holes and vortices avoid mixing and relaxation through strong self-binding effects. The distinction between structures that are mixed and those that are persistent is probed in an analysis of the interaction of an intense vortex and ambient turbulent fluctuations. It is shown that, above a critical amplitude, the shearing of eddies due to the differential rotation of the vortex suppresses the fluctuations that mix its vorticity, allowing it to achieve a lifetime greatly in excess of the turbulent interaction time scale. (DE93-015632; DOE/ET-53088-601; IFSR-601) Avail: CASI HC A04/MF A01

An algorithm is developed to study particle dynamics of beams including collective interaction with high accuracy and low noise. Particle dynamics with collective interactions is treated through particle simulation, where the main or average distribution f(sub 0) and the deviation away from it (delta)f are separately followed. The main distribution f(sub 0) is handled by an analytic equilibrium solution and the perturbation away from it (delta)f is followed by the method of characteristics. We call this the (delta)f algorithm. We specifically model a synchrotron collider which includes the collision section where collective effects of collisions are simulated by this (delta)f algorithm and the rest of the collider where single particle dynamics are treated by simple harmonic transport. The most important target of this simulation is to understand and predict the long-time behavior of the beam luminosity and lifetime. The (delta)f method allows the study of the effect of small perturbations over long timescales on beam lifetime by eliminating the numerical noise problem inherent in Particle-in-Cell techniques. In the (delta)f code using the reference parameters of the SSC (Superconducting Super Collider), beam blow-up near resonances and oscillations in the tune shift, (delta)(nu), far from resonances are observed. In studying long timescale particle diffusion in the phase space of the beams away from resonances, the (delta)f code performance is compared with a tracking code which does not incorporate collective interaction. THE pp ELASTIC SCATTERING EXPERIMENT AT RHIC AND POLARIZATION STUDIES IN THE COULOMB NUCLEAR INTERFERENCE REGION
W. Guryn and N. Akchurin (Iowa Univ., Iowa City.) 1993 6 p Presented at the Future Directions in Particle and Nuclear Physics At Multi-GeV Hadron Beam Facilities, Upton, NY, 4-6 Mar. 1993
(Contract DE-AC02-76CH-00016)
(DE93-015391; BNL-48932; CONF-930389-18) Avail: CASI HC A02/MF A01

We have examined the feasibility of measuring proton proton (pp) elastic scattering at small four momentum transfer t. The application of the measurement as a polarimeter in the Coulomb Nuclear Interference (CNI) region for polarized pp collisions is discussed. In addition, other fundamental polarization phenomena can be explored by making use of the same setup. The configuration of the lattice of the Relativistic Heavy Ion Collider (RHIC) which allows the measurement of scattering in CNI region is

presented. The t range of the experiment is 0.0005 less than t less than 0.2(GeV/c)(sup 2). DOE

(DE93-017055; DOE/ER-40697/2) Avail: CASI HC A03/MF A01

The work was directed in two complementary directions: the D0 experiment at Fermilab, and the GEM detector for the SSC. Efforts have been towards the data taking and analysis with the newly commissioned D0 detector at Fermilab in the (bar-p)p Collider run that started in May 1992 and ended on 1 Jun. 1993. We were involved running and calibration of the calorimeter and tracking chambers, the second level trigger development, and various parts of the data analysis, as well as studies for the D0 upgrade planned in the second half of this decade. Another major accomplishment was the 'delivery' of the Technical Design Report for the GEM SSC detector. Efforts to the overall detector and magnet design, design of the facilities, installation studies, muon system coordination, muon chamber design and tests, muon system simulation studies, and physics simulation studies are described individually in this document. Charge-exchange reactions for scattering to the continuum are considered in a high-energy multiple scattering model. Calculations for (p,n) and (He-3,H-3) reactions are made and compared with experimental results for C-12, O-16, and Al-27 targets. Coherent effects are shown to lead to an important role for inelastic multiple scattering terms when light projectiles are considered. Author

QUARK-LOOP EFFECTS IN HIGH ENERGY SPIN-FLIP PROCESSES
S. V. Goloskokov 1992 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-626692; JINR-E-2-92-103) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

On the basis of QCD long-distance model, the qq-sea contribution to the spin effects is analyzed in the s approaches infinity, t-fixed limit, and it is shown that such effects lead to the spin-flip amplitude growing as s. The magnitude of spin-flip and spin-nonflip amplitudes is estimated within some models for quark and gluon propagators. The relative role of spin effects, the wave function, and the elementary quark subprocess is discussed too. It is shown that the quark-sea effects in the scattering amplitude can reach 30-40% of the contribution of the simple two-gluon exchange at small momenta transfer. DOE

Conversion of transverse energy associated with the coherent motion of displaced beams into thermal energy, and thus emittance growth, has been predicted theoretically by a number of authors. Here, they authors show, using 2-D particle-in-cell simulations, that emittance growth is inhibited for tune depressed beams, if the energy spread of the beam is not too large. Further, using a uniform density model to calculate the space charge field of the beam, they numerically determine the criteria for emittance growth as a function of tune depression, energy spread, and beam displacement over a wide range of parameters. A theoretical interpretation of the results is presented. This study is applicable to an inertial fusion reactor driven by a heavy ion accelerator. DOE

An experimental program was conducted which demonstrated the Source Modulator Outer Product (SMOP) concept for high speed, high efficiency residue number system (RNS) computation. The optical architecture includes the outer product portion and a mapping portion to implement a Lookup Table (LUT). A Fourier transform based approach proved better suited to this architecture than did an image-based approach. Also, while the mapping was experimentally performed with optical fibers, a free-space approach based on an array of holographic optical elements is also contemplated. The end product of this research effort included experimental demonstration and a preliminary design of a high performance optical RNS processor based on the SMOP approach. DTIC

This effort has resulted in the fabrication and demonstration of an optical phase modulator at RF frequencies as high as 64 GHz while using a visible light source. This technique, which is extendable to higher RF frequencies and to longer optical wavelengths, uses a series of high dielectric materials, set at an angle, between the RF signal source to match the resultant velocity of the RF wave with the optical signal in the photonic waveguide. The coupling of the RF wave to the optical signal in the modulator is enhanced by plating resonant antenna structures onto the modulator substrate and electronically interfacing them with the modulator electrodes. This technique can also be applied to interferometric type modulators. DTIC

OPTICAL COUPLING ELEMENTS FOR COHERENT OPTICAL MULTIPORT RECEIVERS Ph.D. Thesis [OPTISCHE KOPPELEMENTE FUER DEN KOHAERENT OPTISCHEN MEHRTOREMPFAENGER]
Ralf Langenhorst 1992 177 p In GERMAN
(ETN-93-94398) Avail: CASI HC A09/MF A02

Three by three (3 by 3) and four by four (4 by 4) port coupling elements and receivers for heterodyne multiport systems are realized. Commercial (3 by 3) fiber coupling elements were used to achieve a usual (3 by 3) port receiver and a (3 by 3) port receiver in pushpull switching,

whose concept was theoretically and experimentally analyzed. It is established that intensity oscillations of laser sources are suppressed by pushpull switching. The influence of thermal noise of opto-electronic input levels is shown to be weaker than in usual (3 by 3) port and (4 by 4) port receivers. Thermal noise effect in pushpull switching is similar to this one in heterodyne receivers. An integrated optical coupling element in LiNbO3 was made with bridge circuit from four waveguide coupling elements and two phase converters, which are electro-optically tunable so that a continuous regulation of intermediate frequency phase can be compensated by temperature variations of the element. To obtain fiber-to-fiber losses lower than a dB, a compact crystal optical coupling element was developed with reference to polarization properties of optical waves. This element supplied the eight necessary intermediate frequency output signals. A direct experimental comparison of bandwidth efficiency of multiport and heterodyne receivers shows a factor two in optical area and a factor three in electrical frequency area. ESA

(Grant NAG1-1443)
(NASA-CR-194576; NAS 1.26:194576) Avail: CASI HC A03/MF A01

Recently, there has been interest in developing a distributed temperature sensor integrated into an optical fiber. Such a system would allow embedding of the optical fiber within or on a structural material to provide for continuous monitoring of the material's temperature. Work has already begun on the development of a temperature sensor using the temperature dependent emission spectra from the lanthanide rare earths doped into crystalline hosts. The lifetime, the linewidth and the integrated intensity of this emission are each sensitive to changes in the temperature and can provide a basis for thermometry. One concept for incorporating this phenomena into an optical fiber based sensor involves bonding the optically active material to the cladding of an optical fiber and allowing the luminescent light to couple into the the fiber by the evanescent wave. Experimental work developing this concept has already been reported. Measurements of the linewidth of Eu3+:Y2O3, diffused into a fiber, made by Albin clearly show a strong and regular dependence on temperature over the range of 300 to 1000 K. We report here on a study of the temperature dependence of the lineshape of the emission at 611 nm using the data in references. We focus attention on understanding the general behavior of the Eu3+:Y2O3 system. Building upon understanding of this system we will be able to establish the physical criterial for a good optical fiber based temperature sensor and then to examine available data on other lanthanide rare earths and transition metal ions to determine the best luminescent system for temperature sensing in an optical fiber. This final report describes the continued design and hardware implementation of an acousto-optic (AO) multichannel adaptive optical processor (MADOP) for application to the cancellation of multipath jamming interference in advanced surveillance radars. The work described in this report was performed for the Photonics Center at Rome Laboratory and represents the second year of Dynetics support on this project. The objective of this effort was the continued fabrication and performance characterization of a multichannel adaptive system that can perform cancellation of multiple wideband (10 MHz) interference sources in the presence of multipath. Specific activities included the following: (1) the simulation of convergence performance of the MADOP algorithms against a variety of multipath conditions; (2) the reconfiguration of the multichannel AO time-integrating correlator for improved stability; (3) the refinement of the AO tapped delay line to achieve better frequency response; (4) the development of the radio frequency interface between the two AO subsystems; and (5) the design and development of a single-loop electronic canceller for improved phase stability after the AO tapped delay line system. A device for position encoding of a rotating shaft in which a polygonal mirror having a number of facets is mounted to the shaft and a monochromatic light beam is directed towards the facets. The facets of the polygonal mirror each have a low line density diffraction grating to diffract the monochromatic light beam into a number of diffracted light beams such that a number of light spots are created on a linear array detector. An analog-to-digital converter is connected to the linear array detector for reading the position of the spots on the linear array detector means. A microprocessor with memory is connected to the analog-to-digital converter to hold and manipulate the data provided by the analog-to-digital converter on the position of the spots and to compute the position of the shaft based upon the data from the analog-to-digital converter. (Grant AF-AFOSR-0140-90)
(AD-A267149; AFOSR-93-0480TR) Avail: CASI HC A02/MF A01

During this period we concentrated our effort in two areas: (1) growth of epitaxial single-crystal beryllium films; and (2) multilayers and interfaces of material pairs incorporating 'new' materials for multilayer x-ray optics. To date we have succeeded in growing epitaxial single-crystal films of beryllium on alpha-Al2O3 (sapphire), silicon, and germanium using molecular beam epitaxy (MBE). This is a major development since beryllium is an excellent spacer for the difficult but desirable water window wavelengths (24 A less than lambda less than 44 A). To our knowledge, this is the first time beryllium has been grown epitaxially on any substrate. Our best quality beryllium films were grown on silicon. The ability to grow a single crystal layer of beryllium is a promising first step toward a beryllium-based single-crystal mirror. In the area of new material pairs. we began by using theoretical reflectivity calculations to assemble a list of promising new material pairs. We then prioritized this list by using what was already known about the materials, such as phase diagrams and diffusion studies. These materials pairs then were studied by sputtering and/or MBE. THE THREE-DIMENSIONAL RAY TRAJECTORIES OF THE WKB OPTICAL FIBER MODES M.S. Thesis
Athanasios Nassopoulos Mar. 1993 102 p
(AD-A267167) Avail: CASI HC A06/MF A02

A model that produces three-dimensional ray trajectories in an optical fiber is derived through the use of a simple correspondence rule. The analysis and simulations presented will be in terms of dimensionless parameters. The curves prepared are presented for allowed radial and azimuthal mode numbers and are presented in terms of dimensions which are normalized by the core radius. The model presented will be shown to be in agreement with the standard Eikonal ray theory and will serve as a link between the ray trajectories and the mode numbers of the WKB waveguide solutions of an optical fiber. SPATIAL FILTERS FOR OPTICAL CORRELATION Final Technical Report, May 1991 - May 1992
David L. Flannery May 1993 17 p
(Contract F30602-88-D-0028)
(AD-A267199; RL-TR-93-65) Avail: CASI HC A03/MF A01

A set of images comprising an azimuthal training set of M-48 tank images was used as the basis of simulation studies to assess the performance of improved metric sort ternary phase-amplitude filters using gray scale inputs. Results compared favorably with those obtained with other filter formulations. Binary versions of these images were used as the basis for a study of image binarization effects on optical correlation performance. The study indicated excellent correlation performance with binarized inputs and references. A set of T-72 tank images, including an azimuthal training set and input scenes with clutter, was the basis for a

simulation study comparing correlation performance of smart TPAF's with gray scale and binary input scenes. The correlation results with binary images were at least equal in quality to those using gray scale inputs. 128 x 128 correlation filters were generated on a zero-filled 256 x 256-pixel array. These filters were correlated with 128 x 128-pixel input scenes (imbedded in a zero-filled 256 x 256 array for digital simulations). Methods for implementing these filters in a correlator with 128 x 128-pixel SLM's at both input and filter planes were investigated by both simulation and experimentation. The two methods provided acceptable results. DTIC

SENSOR MODELLING FOR THE CYCLOPS FOCAL PLANE DETECTOR ARRAY BASED TECHNOLOGY DEMONSTRATOR
G. V. Poropat Dec. 1992 29 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A267172; SRL-0112-RN; DODA-AR-008-151) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The Surveillance Research Laboratory of the DSTO has developed a technology demonstrator utilizing an infrared focal plane detector array to assess the feasibility of using large scale infrared detector arrays for ADF applications. The imaging sensor which has been developed requires no scanning mechanism and uses an array of mercury cadmium telluride detectors sensitive to radiation in the 8 um to 12 um spectral region to produce an image. The sensor was tested in a series of airborne trails and the results obtained from these trials will be used to evaluate the performance of focal plane detector array based systems. A mathematical model of the sensor has been used to evaluate the performance of the sensor. The mathematical model has been developed to meet the requirements imposed by analysis of the performance of this sensor. The model is based on the description of the operation of the elements of the detector array as photon counters. A description of the model used for the analysis of the data obtained using the sensor is presented here. DTIC

OPTOELECTRONICS BASED ON SiGe/Si HETEROSTRUCTURES
Annual Report, 15 Oct. 1991 - 14 Oct. 1992
Kang L. Wang 14 Jan. 1993 18 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0313-91)
(AD-A267176; AFOSR-93-0545TR) Avail: CASI HC A03

The overall objective of the research is to explore SiGe/Si heterostructures for optoelectronic applications. In addition to exploration of new devices, alternative growth techniques for achieving layer thickness to monolayer scale and doping control are also investigated. We have discovered a new transition at normal incidence for p-type quantum well structures, in addition to previously observed intersubband transition. One of the advantages of this intervalence band transition is the detection of infrared at normal incidence. The application of these transitions for the fabrication of tunable normal incidence infrared detectors have also demonstrated. We have also demonstrated normal incidence intersubband transition in the conduction band of SiGe/Si quantum wells grown on (110) Si substrate due to the nonvanishing off-diagonal elements of the effective mass tensor. In the area of transport properties, we have studied the in-plane mobility of coupled delta-doped quantum wells as a function of spacing between the wells. An enhancement of hole mobility above that of the Si was found due to the penetration of wavefunctions into the spacer where the impurity scattering is minimal. In the area of the growth control of SiGe epitaxial layers, we have modified a MBE system for handling the gaseous species for gas beam epitaxy study. DTIC

CLOSED ORBIT DISTORTION AND THE BEAM-BEAM INTERACTION
M. Furman, Y. H. Chin, J. Eden, W. Kozanecki (Commissariat a l'Energie Atomique, Saclay, France.), and J Tennyson 1 Jun. 1992 48 p
(Contract DE-AC03-76SF-00098)
(DE93-015284; LBL-32435-Draft; ESG-193; SLAC-ABC-49) Avail: CASI HC A03/MF A01

We study the applicability of beam-beam deflection techniques as a tuning tool for the SLAC/LBL/LLNL B factory, PEP-II. Assuming that the closed orbits of the two beams are separated vertically at the interaction point by a local orbit bump that is nominally closed, we calculate the residual beam orbit distortions due to the beam-beam interaction. Difference orbit measurements, performed at points conveniently distant from the IP, provide distinct coordinator frequency-space signatures that can be used to maintain the beams in collision and perform detailed optical diagnostics at the IP. A proposal to test this method experimentally at the TRISTAN ring is briefly discussed. DOE

FILTERS FOR THE INTERNATIONAL SOLAR TERRESTRIAL PHYSICS (ISTP) MISSION FAR ULTRAVIOLET IMAGER
Muamer Zukic, Douglas G. Torr, Jongmin Kim, James F. Spann, and Marsha R. Torr 1993 29 p
(Contract NAGw-2898; NAS8-38145)
(NASA-CR-194633; NAS 1.26:194633) Avail: CASI HC A03/MF A01

The far ultraviolet (FUV) imager for the International Solar Terrestrial Physics (ISTP) mission is designed to image four features of the aurora: O I lines at 130.4 nm and 135.6 nm and the N2 Lyman-Birge-Hopfield (LBH) bands between 140 nm - 160 nm (LBH long) and 160 nm - 180 nm (LBH long). In this paper we report the design and fabrication of narrow-band and broadband filters for the ISTP FUV imager. Narrow-band filters designed and fabricated for the O I lines have a bandwidth of less than 5 nm and a peak transmittance of 23.9 percent and 38.3 percent at 130.4 nm and 135.6 nm, respectively. Broadband filters designed and fabricated for LBH bands have the transmittance close to 60 percent. Blocking of out-of-band wavelengths for all filters is better than 5x10(exp -3) percent with the transmittance at 121.6 nm of less than 10(exp -6) percent. Author

MULTILAYER THIN FILM DESIGN FOR FAR ULTRAVIOLET POLARIZERS USING AN INDUCED TRANSMISSION AND ABSORPTION TECHNIQUE
Jongmin Kim, Muamer Zukic, and Douglas G. Torr 1993 14 p
(Contract NAGw-2898; NAS8-38145)
(NASA-CR-194631; NAS 1.26:194631) Avail: CASI HC A03/MF A01

An explanation of induced transmission for spectral regions excluding the far ultraviolet (FUV) is given to better understand how induced transmission and absorption can be used to design effective polarizers in the FUV spectral region. We achieve high s-polarization reflectance and a high degree of polarization (P equals (Rs-Rp)/(Rs+Rp)) by means of a MgF2/Al/MgF2 three layer structure on an opaque thick film of Al as the substrate. For example, our polarizer designed for the Lyman-alpha line (lambda equals 121.6 nm) has 87.95 percent reflectance for the s-polarization case and 0.43 percent for the p-polarization case, with a degree of polarization of 99.03 percent. If a double reflection polarizer is made with this design, it will have a degree of polarization of 99.99 percent and s-polarization throughput of 77.35 percent. Author (revised)

DISPLAY SYSTEM EMPLOYING ACOUSTO-OPTIC TUNABLE FILTER
Patent Application
James L. Lambert, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) 7 Jun. 1993 22 p
(Contract NAS7-918)
(NASA-Case-NPO-18736-1-CU; NAS 1.71:NPO-18736-1-CU; US-Patent-Appl-SN-073235) Avail: CASI HC A03/MF A01

An acousto-optic tunable filter (AOTF) is employed to generate a display by driving the AOTF with a RF electrical signal comprising modulated red, green, and blue video scan line signals and scanning the AOTF with a linearly polarized, pulsed light beam, resulting in encoding of color video columns (scan lines) of an input video image into vertical columns of the AOTF output beam. The AOTF is illuminated periodically as each acoustically-encoded scan line fills the cell aperture of the AOTF. A polarizing beam splitter removes the unused first order beam component of the AOTF output and, if desired, overlays a real world scene on the output plane. Resolutions as high as 30,000 lines are possible, providing holographic display capability. NASA

POLISHED SUBSTRATE SURFACE AND CLEANING STUDY FOR COATED OPTIC QUALITY

A. Tesar, W. Eickelberg, K. Koons (Optical Coating Lab., Inc., Santa Rosa, CA.), and K. Davis (Optical Coating Lab., Inc., Santa Rosa, CA.) Nov. 1992 5 p Presented at the OPTCON 1992 Optical Fabrication and Testing Workshop, Boston, MA, 17 Nov. 1992
(Contract W-7405-eng-48)
(DE93-014116; UCRL-JC-111397; CONF-9211104-9) Avail: CASI HC A01/MF A01

The optical substrate-coating interface is established by the following: (1) the original polished condition of the substrate; (2) the substrate cleaning process; and (3) the environment of the coating process. The substrate-coating interface has the following characteristics: affects the coating adhesion properties; is where most coating defects and scatter sites are thought to initiate; and, in some instances, may control the structure of the coating as it is deposited. Often features appear on an optic after coating which could not be observed after cleaning and prior to coating. Because of the wide variety of possible substrate materials, surface problems, and contaminants, the cleaning processes are constantly evolving. Our study has clearly shown that the coating appearance is dependent not only on the cleaning method, but on the initial character of the substrate surface. DOE

DESIGN AND FABRICATION OF A REFLECTION FAR ULTRAVIOLET POLARIZER AND RETARDER
Jongmin Kim, Muamer Zukic, Michele M. Wilson, and Douglas G. Torr 1993 19 p
(Contract NAGw-2898; NAS8-38145)
(NASA-CR-194630; NAS 1.26:194630) Avail: CASI HC A03/MF A01

New methods have been developed for the design of a far ultraviolet multilayer reflection polarizer and retarder. A MgF2/Al/MgF2 three-layer structure deposited on a thick opaque Al film (substrate) is used for the design of polarizers and retarders. The induced transmission and absorption method is used for the design of a polarizer and layer-by-layer electric field calculation method is used for the design of a quarterwave retarder. In order to fabricate these designs in a conventional high vacuum chamber, we have to minimize the oxidation of the Al layers and somehow characterize the oxidized layer. X-ray photoelectron spectroscopy is used to investigate the amount and profile of oxidation. Depth profiling results and a seven layer oxidation model are presented. Author (revised)

TRANSPARENT CONDUCTIVE COATINGS IN THE FAR ULTRAVIOLET
Jongmin Kim, Muamer Zukic, Jung Ho Park, Michele M. Wilson, Charles E. Keffer, and Douglas G. Torr 1993 8 p
(Contract NAGw-2898; NAS8-38145)
(NASA-CR-194632; NAS 1.26:194632) Avail: CASI HC A02/MF A01

In certain cases a space-borne optical instrument with a dielectric window requires a transparent conductive coating deposited on the window to remove the electrostatic charge collected due to the bombardment of ionized particles. Semiconductor and metal films are studied for use as transparent conductive coatings for the front window of far ultraviolet camera. Cr is found to be the best coating material. The theoretical search for the semiconductor and metal coating materials and experimental results for ITO and Cr films are reported. Author (revised)

HIGH-PERFORMANCE NONLINEAR OPTICAL MATERIAL DEVELOPED IN JAPAN
Sheng Li 25 May 1993 6 p Transl. into ENGLISH from unidentified Chinese language document, cols 2-4 p 3
(AD-A266194; FASTC-IR(RS)T-0959-92) Avail: CASI HC A02/MF A01

The world's best performing nonlinear optical material was recently developed by the Asahi Corporation. The nonlinear three-dimensionality of this new material is 1000 times higher than any known material. This new material is made by spreading fine particles of cuprous chloride (with semiconductor properties) onto a special glass. The fine cuprous chloride particles are only 5 to 10 nanometers in diameter. After the cuprous chloride particles are melted onto the special glass, they are subjected to heat treatment before cooling, thus producing uniform fine particles. DTIC

OETC OPTICAL BACKPLANE BUS TESTBED. IBM TASKS: RECEIVER OEIC AND LINK SIMULATION TOOLS AND ANALYSIS Milestone Report
John Crow, Richard Bates, Young Kwark, Dennis Rogers, and Dan Kuchta 20 May 1993 17 p
(Contract MDA972-92-C-0075)
(AD-A266198) Avail: CASI HC A03/MF A01

This report describes the following: the strategy adopted for developing a bus simulation tool; the parameters chosen for the component models which are used in the tool; the experimental determination of the parameters for one of the key devices in the link, the VSEL; and the experimental and simulation analysis used to predict the first pass link behavior. The major accomplishments are as follows: (1) that a set of specifications were developed; and (2) that a design for the VSEL source for the transmitter was established based on device and link characterization at IBM. Operational parameters for the transmitter simulation model were developed. With these accomplishments, first pass components for the link can, and are, being designed and fabricated. DTIC

RATIONAL DESIGN, CONSTRUCTION, AND PROCESSING OF HIGH-PERFORMANCE NONLINEAR OPTICAL MATERIALS Final Report, 1 Dec. 1990 - 30 Nov. 1992
T. J. Marks, G. K. Wong, and M. A. Ratner 14 May 1993 16 p
(Grant AF-AFOSR-0071-90)
(AD-A266185; AFOSR-93-0440TR) Avail: CASI HC A03/MF A01

This project consists of a collaborative synthetic, processing, physical characterization, and theoretical program aimed at the rational design, construction, evaluation, and fundamental understanding of new types of maximum-performance molecule/polymer-based materials exhibiting high second-order (CHI(2)) optical nonlinearities. Areas of emphasis include poled chromophore-functionalized glassy polymers, poled chromophore-embedded crosslinkable matrices, chromophoric self-assembled superlattices, the theoretical design and analysis of novel chromophores and chromophore environments, theoretical studies of poling dynamics, studies of optical damage phenomena, and fabrication of new types of NLO waveguides. Each research component of this highly interactive effort builds upon work already in progress as well as upon strong on-going collaborations in laser optics and quantum theory. DTIC

FABRICATION AND PHASE TUNING OF AN OPTICAL WAVEGUIDE DEVICE Patent
William K. Burns, inventor (to Navy), Catherine H. Bulmer, inventor (to Navy), and Arthur S. Greenblatt, inventor (to Navy) 16 Mar. 1993 7 p Filed 27 Sep. 1991 Supersedes AD-D015179
(AD-D015815; US-Patent-5,195,163; US-Patent-Appl-SN-766939; US-Patent-Class-385-132) Avail: US Patent and Trademark Office

The manufacture of an optical waveguide device utilizing a fast, accurate method for tuning of the output phase angle of such devices to a desired operating point is described. Tuning is accomplished by adjusting the accumulated phase along a waveguide arm of the device by removing optical waveguide material using laser ablation. Due to the change in waveguide geometry in the ablated region, the optical phase velocity is changed and thus the optical path length is affected in that section of waveguide, thereby resulting in a change in output phase angle. MAXIMUM LIKELIHOOD TECHNIQUES APPLIED TO QUASI-ELASTIC LIGHT SCATTERING Final Report
Robert V. Edwards 24 Aug. 1992 3 p
(Contract NCC3-115)
(NASA-CR-193550; NAS 1.26:193550) Avail: CASI HC A01/MF A01

There is a necessity of having an automatic procedure for reliable estimation of the quality of the measurement of particle size from QELS (Quasi-Elastic Light Scattering). Getting the measurement itself, before any error estimates can be made, is a problem because it is obtained by a very indirect measurement of a signal derived from the motion of particles in the system and requires the solution of an inverse problem. The eigenvalue structure of the transform that generates the signal is such that an arbitrarily small amount of noise can obliterate parts of any practical inversion spectrum. This project uses the Maximum Likelihood Estimation (MLE) as a framework to generate a theory and a functioning set of software to oversee the measurement process and extract the particle size information, while at the same time providing error estimates for those measurements. The theory involved verifying a correct form of the covariance matrix for the noise on the measurement and then estimating particle size parameters using a modified histogram approach. OPTICAL DISPLAYS: A TUTORIAL ON IMAGES AND IMAGE FORMATION Final Report, Oct. 1990 - Oct. 1992
Herschel C. Self Oct. 1992 115 p
(AD-A266230; AL-TR-1992-0178) Avail: CASI HC A06/MF A02

The tutorial presents basic image and optical display concepts. To aid in understanding the concepts, discussion, figures, and tables, derivations in detail of optical equations are presented. Examples and alternative derivations clarify the concepts. High school algebra and trigonometry are adequate for following the derivations. Extensive use is made of the basic Gauss lens equation relating object distance and lens focal length to image distance. Topics include real and virtual images, image size and distance, proper viewing distance, exit pupil diameter and location, varying optical distance with a magnifier, focal length, objectives and eyepieces, relays, microscopes and telescopes, optical system complexity, etc. Compound optical systems with an objective and an eyepiece, and systems that also include a relay lens, are examined. Optical and mechanical considerations for helmet-mounted displays (HMDs), and the compromises and trade-offs required in designing such systems are presented in considerable detail. DTIC

OPTICAL PROPERTIES OF WATER RELEASED IN LOW EARTH ORBIT
James A. Gardner, II, David L. Rall, Christian A. Trowbridge, Irving L. Kofsky, and Rodney A. Viereck 21 Jun. 1993 13 p
(Contract F19628-91-C-0061)
(AD-A266197; PL-TR-93-2134) Avail: CASI HC A03/MF A01

Analysis of intensified video photographs of a twilight venting of excess water from the space shuttle showed that the approx. 1 mm diameter stream cavitationally fragments within about 1 m, forming two discrete-particle components and vapor. The images from nearby cameras are dominated by irregular, polydisperse water/ice droplets with sizes comparable with the venting orifice and outward velocity indistinguishable from that of the initially coherent liquid. In contrast the 2 1/2 km-long quasiconical trail imaged from a distant ground station consists of accompanying submicron ice spherules that were produced by partial recondensation of the overexpanded vacuum-evaporated water gas, which are sublimating at rates that we calculated from the measured falloff of axial sunlight-scatter radiance and the energy balance of progressively roughening ice at 329 km altitude; at low latitudes they cool to 180 K in less than 1 s, and their radii transition to the Rayleigh-scattering range in approx. 1 min. The very much larger fragmentation particles come to a slightly higher equilibrium temperature within approx. 2 min, and persist for a few earth orbits. These three components of the vented water (and other high vapor pressure liquids) radiate and scatter earthshine and solar photons, and the orbital-velocity molecules are also excited by collisions with the residual atmospheric gas, overlaying wide-angle contaminating foregrounds on remote optical sensing from onboard. A FORMAL PROTOCOL TEST PROCEDURE FOR THE SURVIVABLE ADAPTABLE FIBER OPTIC EMBEDDED NETWORK (SAFENET) M.S. Thesis
Wayne High Mar. 1993 118 p
(AD-A267410) Avail: CASI HC A06/MF A02

This thesis focuses upon a new method for verifying the correct operation of a complex, high speed fiber optic communication network. These networks are of growing importance to the military because of their increased connectivity, survivability, and reconfigurability. With the introduction and increased dependence on sophisticated software and protocols, it is essential that their operation be correct. Because of the speed and complexity of fiber optic networks being designed today, they are becoming increasingly difficult to test. Previously, testing was accomplished by application of conformance test methods which had little connection with an implementation's specification. The major goal of

conformance testing is to ensure that the implementation of a profile is consistent with its specification. Formal specification is needed to ensure that the implementation performs its intended operations while exhibiting desirable behaviors. The new conformance test method presented is based upon the System of Communicating Machine model which uses a formal protocol specification to generate a test sequence. The major contribution of this thesis is the application of the System of Communicating Machine model to formal profile specifications of the Survivable Adaptable Fiber Optic Embedded Network (SAFENET) standard which results in the derivation of test sequences for a SAFENET profile. The results applying this new method to SAFENET's OSI and Lightweight profiles are presented. DTIC

SPECKLES STATISTICS AND DECORRELATION EFFECTS IN COMPLEX ABCD OPTICAL SYSTEMS
H. T. Yura, S. G. Hanson, and T. P. Grum 15 Dec. 1992 36 p
(Contract F04701-88-C-0089)
(AD-A267843; TR-92(2409)-3; SMC-TR-93-35) Avail: CASI HC A03/MF A01

The mean, variance, and correlation function of the intensity pattern resulting from an incoherent source that has propagated through a complex ABCD optical system is derived. The number of speckle correlation cells (or modes) within an effective measurement area is presented and discussed. Optical field decorrelation effects regarding secondary fringe formation in phase shifting speckle interferometry is discussed. In particular, the correlation coefficient resulting from load-induced object tilt, in-plane translations, and displacements parallel to the optic axis as a function of the number of modes propagating through the optical system is described and discussed. THEORETICAL STUDIES OF NONLINEAR OPTICAL PROPERTIES OF CONJUGATED POLYMERS Final Report, 1 Jan. - 31 Dec. 1992
Robert J. Silbey 21 May 1993 9 p
(Grant AF-AFOSR-0077-90)
(AD-A267390; AFOSR-93-0560TR) Avail: CASI HC A02/MF A01

The study of the nonlinear optical properties of polymeric systems is a challenging and exciting field of research ranging from device engineering, optical measurements, chemical synthesis to design and theoretical issues. At the present time, most of the basic science needed for the synthesis of molecules and the design of devices utilizing second order optical susceptibilities is in hand, although certain issues remain to be resolved. On the other hand, many important questions regarding the design and use of third order optical susceptibilities are still unanswered. The earliest ideas of the importance of low dimensionality optical band gaps suggests the use of conjugated molecules. At present, there is considerable effort, both experimentally and theoretically, in optimizing the value of gamma for polymers or oligomers with conjugated segments, because such conjugated polymers (like polyacetylene, polythiophenes, and the poly-diacetylenes) have very large gamma. These polymers have also been under intense scrutiny because of their large conductivities when doped. Although we are beginning to understand the theoretical reasons for the various unusual properties of the materials, we do not understand the factors that limit the ultimate value of gamma. For example, what are the important structures and interactions in the molecule the prevent gamma from being as large as possible while still having a small absorption coefficient, and how can we design molecules with these constraints in mind. PERFORMANCE OF CODED COHERENT FSK LIGHTWAVE SYSTEM WITH NONCOHERENT DETECTION
Thomas E. Neely Mar. 1993 76 p
(AD-A267442) Avail: CASI HC A05/MF A01

The original coherent lightwave systems were expected to offer significant performance gains relative to standard direct detection systems. This expectation has not been realized due to the effects of laser phase noise. The laser phase noise process results in the integration of a random variable that transitions over the integration period from a Gaussian distribution to a uniform distribution. The use of convolutional coding effectively replaces a single bit time, with its mostly noncoherently integrating latter portion, by several more coherently integrating bits. This primary bit-time effect comes in addition to the normal coding effect of efficiently trading bandwidth for error performance. The improvement in performance brought about from coding may enable coherent systems to live up to previous expectations. The contributions of this thesis include the visualization of the phase noise process, the efficient computation of the laser phase noise power factor probability density function, and the computation of performance curves for uncoded and coded systems. Additional sections on coherent lightwave systems and coding provide tutorial information. A potential military application is discussed, along with practical implementation issues. DTIC

REGULAR AND IRREGULAR REFLECTION OF A WAVE FROM A SLANTING FLAT WALL [REGULARNE I NIEREGULARNE ODBICIE FALI UDERZENIOWEJ OD SKOSNIE USTAWIONEJ PLASKIEJ SCIANKI]
Zbigniew A. Walenta 1991 37 p In POLISH
(IFTR-13/1991) Avail: CASI HC A03/MF A01

This survey contains a discussion of theoretical and experimental studies that the author considers to be the most important research for understanding quasi-stationary reflection of a plane wave by a prism. Primary attention is focused on recently published experimental studies carried out with strong gas rarification relating to phenomena adjacent to the edge of the reflecting prism. Attention is also focused on significant qualitative differences between wave reflection under stationary and quasi-stationary conditions that cause such phenomena to be treated as equivalent, solely for the case of strong waves. TRANSMISSION OF LIGHT THROUGH A TURBULENT MIXING LAYER Final Report, 30 Sep. 1989 - 30 Jun. 1992
Anatol Roshko and John Wissler 14 Aug. 1992 5 p
(Grant AF-AFOSR-0552-89)
(AD-A267266; AFOSR-93-0468TR) Avail: CASI HC A01/MF A01

Light transmission through incompressible gaseous turbulent mixing layers was investigated with the objective of understanding the effects of large-scale coherent structures and mixing transition on the optical quality of the mixing layer. Experiments were done in a vertically flowing mixing layer which is enclosed inside a pressure tank and fed by two banks of high-pressure gas bottles. The study considered both the unequal density (high-speed He and low-speed N2) and equal density (high-speed N2 and low-speed He-Ar) cases; the mixing of dissimilar gases is the source of the optical aberrations. Large-scale Reynolds numbers ranged between 3500 and 80000 over pressures from 2 to 6 bar. Light transmission characteristics were first studied qualitatively using a network of thin sheets of short-exposure (approximately 1 microsec) white light which were aberrated by the mixing layer and then imaged directly onto photographic film. Light transmission characteristics were then studied quantitatively using a lateral effect detector to dynamically track a thin He-Ne laser beam as it wandered under the influence of the passing coherent structures. The study found that the spanwise coherent structures generate systematic deflections of the light beam in the streamwise direction; the greatest deflections occur near the trailing edges of the structures at a formation called the cusp, where the high-speed fluid and low-speed fluid are entrained

into the vortex core. The streamwise coherent structures, which form later in the mixing layer's development than the spanwise structures, generate substantial beam deflections in the spanwise direction which are closely associated with the streamwise streaks in plan-view shadowgraphs. DTIC

Avail: CASI HC A03/MF A04

We describe the current state of binary optics, addressing both the technology and the industry (i.e., marketplace). With respect to the technology, the two dominant aspects are optical design methods and fabrication capabilities, with the optical design problem being limited by human innovation in the search for new applications and the fabrication issue being limited by the availability of resources required to improve fabrication capabilities. With respect to the industry, the current marketplace does not favor binary optics as a separate product line and so we expect that companies whose primary purpose is the production of binary optics will not represent the bulk of binary optics production. Rather, binary optics' more natural role is as an enabling technology - a technology which will directly result in a competitive advantage in a company's other business areas - and so we expect that the majority of binary optics will be produced for internal use. Avail: CASI HC A03/MF A04

A review of the rigorous coupled-wave analysis as applied to the diffraction of electro-magnetic waves by gratings is presented. The analysis is valid for any polarization, angle of incidence, and conical diffraction. Cascaded and/or multiplexed gratings as well as material anisotropy can be incorporated under the same formalism. Small period rectangular groove gratings can also be modeled using approximately equivalent uniaxial homogeneous layers (effective media). The ordinary and extraordinary refractive indices of these layers depend on the gratings filling factor, the refractive indices of the substrate and superstrate, and the ratio of the freespace wavelength to grating period. Comparisons of the homogeneous effective medium approximations with the rigorous coupled-wave analysis are presented. Antireflection designs (single-layer or multilayer) using the effective medium models are presented and compared. These ultra-short period antireflection gratings can also be used to produce soft x-rays. Comparisons of the rigorous coupled-wave analysis with experimental results on soft x-ray generation by gratings are also included. Author

SUBWAVELENGTH STRUCTURED SURFACES AND THEIR APPLICATIONS
Daniel H. Raguin and G. Michael Morris *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 87-97 (For primary document see N94-17331 03-74)
Avail: CASI HC A03/MF A04

The term subwavelength structured (SWS) surface describes any surface that contains a subwavelength-period grating or gratings. The grating may be of any type provided the period is sufficiently fine so that, unlike conventional gratings, no diffraction orders propagate other than the zeroth orders. Because of the fine periods involved, the fabrication of such surfaces for applications in the visible and infrared portions of the spectral regime have only recently been considered. With refinements in holographic procedures and the push of the semiconductor industry for submicron

lithography, production of SWS surfaces is becoming increasingly viable. The topics covered include the following: analytic approaches to analyze SWS surfaces, 1D periodic stratification and effective medium theory, design of waveplates using form birefringence, and 2D binary antireflection structured surfaces. DIFFRACTIVE OPTICAL ELEMENTS FOR GENERATING ARBITRARY LINE FOCI
Joseph N. Mait, Dennis W. Prather, Joseph vanderGracht, and Tristan J. Tayag *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 99-105 (For primary document see N94-17331 03-74)
Avail: CASI HC A02/MF A04

The key optical component in the architecture of the linearly variable magnification telescope presented here is a conical lens. This architecture has application to Doppler radar processing and to wavelet processing. Unfortunately, the unique surface profile of a conical lens does not allow traditional grinding techniques to be used for fabrication; therefore, its fabrication is considered custom. In addition to the requirement of custom fabrication, a refractive conical lens introduces phase aberrations that are intrinsic to its conic shape. Further, due to the large prismatic component of the lens, the variable magnification telescope architecture is off-axis. To overcome the fabrication and application difficulties of a refractive lens, we consider the construction of a hybrid diffractive-refractive lens. Derived from text

FINITE DIFFERENCE TIME DOMAIN ANALYSIS OF CHIRPED DIELECTRIC GRATINGS
Diane H. Hochmuth and Eric G. Johnson *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 107-110 (For primary document see N94-17331 03-74)
Avail: CASI HC A01/MF A04

The finite difference time domain (FDTD) method for solving Maxwell's time-dependent curl equations is accurate, computationally efficient, and straight-forward to implement. Since both time and space derivatives are employed, the propagation of an electromagnetic wave can be treated as an initial-value problem. Second-order central-difference approximations are applied to the space and time derivatives of the electric and magnetic fields providing a discretization of the fields in a volume of space, for a period of time. The solution to this system of equations is stepped through time, thus, simulating the propagation of the incident wave. If the simulation is continued until a steady-state is reached, an appropriate far-field transformation can be applied to the time-domain scattered fields to obtain reflected and transmitted powers. From this information diffraction efficiencies can also be determined. In analyzing the chirped structure, a mesh is applied only to the area immediately around the grating. The size of the mesh is then proportional to the electric size of the grating. Doing this, however, imposes an artificial boundary around the area of interest. An absorbing boundary condition must be applied along the artificial boundary so that the outgoing waves are absorbed as if the boundary were absent. Many such boundary conditions have been developed that give near-perfect absorption. In this analysis, the Mur absorbing boundary conditions are employed. Several grating structures were analyzed using the FDTD method. Derived from text

ASYMMETRIC THREE-BEAM BINARY OPTIC GRATING
Alan D. Kathman, Eric G. Johnson, and Miles L. Scott *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 111-115 (For primary document see N94-17331 03-74)
Avail: CASI HC A01/MF A04

Binary and diffractive optical components are finding many applications in optical systems and integrated optical devices. A recent application required the development of a two-dimensional diffraction grating to perform an asymmetric, three-beam fanout. In this paper, techniques are presented for the design of arbitrary fanout grating devices. Modeling and optimization processes are demonstrated for the three-beam grating. The counter-intuitive results of the initial design are discussed, and experimental data verifying performance are presented. Author

There are a number of sources of scattering in binary optics: etch depth errors, line edge errors, quantization errors, roughness, and the binary approximation to the ideal surface. These sources of scattering can be systematic (deterministic) or random. In this paper, scattering formulas for both systematic and random errors are derived using Fourier optics. These formulas can be used to explain the results of scattering measurements and computer simulations. Author

MATHMATICAL MODELING FOR DIFFRACTIVE OPTICS
David Dobson and J. Allen Cox (Honeywell, Inc., Bloomington, MN.) *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 135-151 (For primary document see N94-17331 03-74)
Avail: CASI HC A03/MF A04

We consider a 'diffractive optic' to be a biperiodic surface separating two half-spaces, each having constant constitutive parameters; within a unit cell of the periodic surface and across the transition zone between the two half-spaces, the constitutive parameters can be a continuous, complex-valued function. Mathematical models for diffractive optics have been developed, and implemented as numerical codes, both for the 'direct' problem and for the 'inverse' problem. In problems of the 'direct' class, the diffractive optic is specified, and the full set of Maxwell's equations is cast in a variational form and solved numerically by a finite element approach. This approach is well-posed in the sense that existence and uniqueness of the solution can be proved and specific convergence conditions can be derived. An example of a metallic grating at a Wood anomaly is presented as a case where other approaches are known to have convergence problems. In problems of the 'inverse' class, some information about the diffracted field (e.g., the far-field intensity) is given, and the problem is to find the periodic structure in some optimal sense. Two approaches are described: phase reconstruction in the far-field approximation; and relaxed optimal design based on the Helmholtz equation. Practical examples are discussed for each approach to the inverse problem, including array generators in the far-field case and antireflective structures for the relaxed optimal design. Author

FABRICATING BINARY OPTICS: AN OVERVIEW OF BINARY OPTICS PROCESS TECHNOLOGY
Margaret B. Stern *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 153-166 Sponsored by DARPA (For primary document see N94-17331 03-74)
Avail: CASI HC A03/MF A04

A review of binary optics processing technology is presented. Pattern replication techniques have been optimized to generate high-quality efficient microoptics in visible and infrared materials. High resolution optical photolithography and precision alignment is used to fabricate maximally efficient fused silica diffractive microlenses at lambda = 633 nm. The degradation in optical efficiency of four-phase-level fused silica microlenses resulting from an intentional 0.35 micron translational error has been systematically measured as a function of lens speed (F/2 - F/60). Novel processes necessary for high sag refractive IR microoptics arrays, including deep anisotropic Si-etching, planarization of deep topography and multilayer resist techniques, are described. Initial results are presented for monolithic integration of photonic and microoptic systems. Author

FABRICATION TECHNIQUES FOR VERY FAST DIFFRACTIVE LENSES
Anthony M. Tai and Joseph C. Marron *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 179-185 (For primary document see N94-17331 03-74)
Avail: CASI HC A02/MF A04

Aspheric lenses with arbitrary phase functions can be fabricated on thin light weight substrates via the binary optics fabrication technique. However, it is difficult and costly to fabricate a fast lens (f/number less than 1) for use as the shorter wavelengths. The pitch of the masks and the alignment accuracy must be very fine. For a large lens, the space-bandwidth product of the element can also become impractically large. In this paper, two alternate approaches for the fabrication of fast aspheric diffractive lenses are described. The first approach fabricates the diffractive lens interferometrically, utilizing a spherical wavefront to provide the optical power of the lens and a computer generated hologram to create the aspheric components. The second approach fabricates the aspheric diffractive lens in the form if a higher order kinoform which trades groove profile fidelity for coarser feature size. The design and implementation issues for these two fabrication techniques are discussed. Author

LASER FIGURING FOR THE GENERATION OF ANALOG MICRO-OPTICS AND KINEFORM SURFACES
Edward J. Gratrix *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 187-193 Sponsored in part by Strategic Defense Initiative Organization (For primary document see N94-17331 03-74)
Avail: CASI HC A02/MF A04

To date, there have been many techniques used to generate micro-optic structures in glass or other materials. Using methods common to the lithographic industry, the manufacturing technique known as 'binary optics,' has demonstrated the use of diffractive optics in a variety of micro-optic applications. It is well established that diffractive structures have limited capability when applied in a design more suited for a refractive element. For applications that demand fast, highly efficient, broadband designs, we have developed a technique which uses laser figuring to generate the refractive micro-optical surface. This paper describes the technique used to fabricate refractive micro-optics. Recent results of micro-optics in CdZnTe focal planes are shown. Author

DIFFRACTIVE OPTICS FABRICATED BY DIRECT WRITE METHODS WITH AN ELECTRON BEAM
Bernard Kress, David Zaleta, Walter Daschner, Kris Urquhart, Robert Stein, and Sing H. Lee *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 195-205 (For primary document see N94-17331 03-74)
Avail: CASI HC A03/MF A04

State-of-the-art diffractive optics are fabricated using e-beam lithography and dry etching techniques to achieve multilevel phase elements with very high diffraction efficiencies. One of the major challenges encountered in fabricating diffractive optics is the small feature size (e.g. for diffractive lenses with small f-number). It is not only the e-beam system which dictates the feature size limitations, but also the alignment systems (mask aligner) and the materials (e-beam and photo resists). In order to allow diffractive optics to be used in new optoelectronic systems, it is necessary not only to fabricate elements with small feature sizes but also to do so in an economical fashion. Since price of a multilevel diffractive optical element is closely related to the e-beam writing time and the number of etching steps, we need to decrease the writing time and etching steps without affecting the quality of the element. To do this one has to utilize the full potentials of the e-beam writing system. In this paper, we will present three diffractive optics fabrication techniques which will reduce the number of process steps, the writing time, and the overall fabrication time for multilevel phase diffractive optics. PHASE HOLOGRAMS IN PMMA WITH PROXIMITY EFFECT CORRECTION **c35**
Paul D. Maker and R. E. Muller *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 207-221 Sponsored in part by Strategic Defense Initiative Organization (For primary document see N94-17331 03-74)
Avail: CASI HC A03/MF A04

Complex computer generated phase holograms (CGPH's) have been fabricated in PMMA by partial e-beam exposure and subsequent partial development. The CGPH was encoded as a sequence of phase delay pixels and written by the JEOL JBX-5D2 E-beam lithography system, a different dose being assigned to each value of phase delay. Following carefully controlled partial development, the pattern appeared rendered in relief in the PMMA, which then acts as the phase-delay medium. The exposure dose was in the range 20-200 micro-C/sq cm, and very aggressive development in pure acetone led to low contrast. This enabled etch depth control to better than plus or minus lambda(sub vis)/60. That result was obtained by exposing isolated 50 micron square patches and measuring resist removal over the central area where the proximity effect dose was uniform and related only to the local exposure. For complex CGPH's with pixel size of the order of the e-beam proximity effect radius, the patterns must be corrected for the extra exposure caused by electrons scattered back up out of the substrate. This has been accomplished by deconvolving the two-dimensional dose deposition function with the desired dose pattern. The deposition function, which plays much the same role as an instrument response function, was carefully measured under the exact conditions used to expose the samples. The devices fabricated were designed with 16 equal phase steps per retardation cycle, were up to 1 cm square, and consisted of up to 100 million 0.3-2.0 micron square pixels. Data files were up to 500 MB long and exposure times ranged to tens of hours. A Fresnel phase lens was fabricated that hed diffraction limited optical performance with better than 85 percent efficiency. Author

Avail: CASI HC A03/MF A04

We describe the fabrication and operational characteristics of a novel, surface-emitting semiconductor laser that makes use of a concentric-circle grating to both define its resonant cavity and to provide surface emission. A properly fabricated circular grating causes the laser to operate in radially inward- and outward-going circular waves in the waveguide, thus, introducing the circular symmetry needed for the laser to emit a beam with a circular cross-section. The basic circular-grating-resonator concept can be implemented in any materials system; an AlGaAs/GaAs graded-index, separate confinement heterostructure (GRINSCH), single-quantum-well (SQW) semiconductor laser, grown by molecular beam epitaxy (MBE), was used for the experiments discussed here. Each concentric-circle grating was fabricated on the surface of the AlGaAs/GaAs semiconductor laser. The circular pattern was first defined by electron-beam (e-beam) lithography in a layer of polymethylmethacrylate (PMMA) and subsequently etched into the semiconductor surface using chemically-assisted (chlorine) ion-beam etching (CAIBE). We consider issues that affect the fabrication and quality of the gratings. These issues include grating design requirements, data representation of the grating pattern, and e-beam scan method. We provide examples of how these techniques can be implemented and their impact

on the resulting laser performance. A comparison is made of the results obtained using two fundamentally different electron-beam writing systems. Circular gratings with period lambda = 0.25 microns and overall diameters ranging from 80 microns to 500 microns were fabricated. We also report our successful demonstration of an optically pumped, concentric-circle grating, semiconductor laser that emits a beam with a far-field divergence angle that is less than one degree. The emission spectrum is quite narrow (less than 0.1 nm) and is centered at wavelength lambda = 0.8175 microns. Author

The current generation of electro-optical sensors utilizing refractive and reflective optical elements require sophisticated, complex, and expensive designs. Advanced-technology-based electro-optical sensors of minimum size and weight require miniaturization of optical, electrical, and mechanical devices with an increasing trend toward integration of various components. Micro-optics technology has the potential in a number of areas to simplify optical design with improved performance. This includes internally cooled apertures, hybrid optical design, microlenses, dispersive multicolor microlenses, active dither, electronically controlled optical beam steer, and microscopic integration of micro-optics, detectors, and signal processing layers. This paper describes our approach to the development of micro-optics technology with our main emphasis for sensors applications. Author

DIFFRACTIVE OPTICS IN ADVERSE ENVIRONMENTS

Gregory P. Behrmann *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 271-281 (For primary document see N94-17331 03-74)

Avail: CASI HC A03/MF A04

An investigation at the Army Research Laboratory is in progress to characterize DOE performance in mil-spec environments. One of the most significant environmental influences is temperature. An analysis of a diffractive lens is presented in which optical performance is described as a function of temperature. In particular, we review the thermal dependence of focal length and diffraction efficiency. It is shown that the change in these parameters is independent of lens shape and relates only to material properties. Thermalized hybrid refractive/diffractive designs are discussed. Author

LOW COST PATHS TO BINARY OPTICS

Arthur Nelson and Lawrence Domash *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 283-302 Sponsored by NSWC and Center for Night Vision and Electro-Optics (For primary document see N94-17331 03-74)

Avail: CASI HC A03/MF A04

Application of binary optics has been limited to a few major laboratories because of the limited availability of fabrication facilities such as e-beam machines and the lack of standardized design software. Foster-Miller has attempted to identify low cost approaches to medium-resolution binary optics using readily available computer and fabrication tools, primarily for the use of students and experimenters in optical computing. An early version of our system, MacBEEP, made use of an optimized laser film recorder from the commercial typesetting industry with 10 micron resolution. This report is an update on our current efforts to design and build a second generation MacBEEP, which aims at 1 micron resolution and multiple phase levels. Trails included a low cost scanning electron microscope in microlithography mode, and alternative laser inscribers or photomask generators. Our current software approach is based on Mathematica and PostScript compatibility. Author

SURPHEX (TM): NEW DRY PHOTOPOLYMERS FOR REPLICATION OF SURFACE RELIEF DIFFRACTIVE OPTICS

Felix P. Shvartsman *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 359-368 Submitted for publication (For primary document see N94-17331 03-74)

Avail: CASI HC A02/MF A04

High efficiency, deep groove, surface relief Diffractive Optical Elements (DOE) with various optical functions can be recorded in a photoresist using conventional interferometric holographic and computer generated photolithographic recording techniques. While photoresist recording media are satisfactory for recording individual surface relief DOE, a reliable and precise method is needed to replicate these diffractive microstructures to maintain the high aspect ratio in each replicated DOE. The term 'high aspect ratio' means that the depth of a groove is substantially greater, i.e. 2, 3, or more times greater, than the width of the groove. A new family of dry photopolymers SURPHEX was developed recently at Du Pont to replicate such highly efficient, deep groove DOE's. SURPHEX photopolymers are being utilized in Du Pont's proprietary Dry Photopolymer Embossing (DPE) technology to replicate with very high degree of precision almost any type of surface relief DOE. Surfaces relief microstructures with width/depth aspect ratio of 1:20 (0.1 micron/2.0 micron) were faithfully replicated by DPE technology. Several types of plastic and glass/quartz optical substrates can be used for economical replication of DOE. Author

PREDESIGN OF DIAMOND TURNED REFRACTIVE/DIFFRACTIVE ELEMENTS FOR IR OBJECTIVES

Max J. Riedl *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 369-385 (For primary document see N94-17331 03-74)

Avail: CASI HC A03/MF A04

Diffractive lenses have arrived. Literally hundreds of papers have been published and technology impact reports have been written about the exciting addition of a new tool for the lens designer. Sophisticated computer programs have been developed to aid in the optimization of these diffractive phase profiles for a wide variety of applications. Now, several fabrication methods are being pursued to produce these diffractive elements economically. The best known process is the etching of a multi-level relief grating, known as binary optics. This process uses sets of computer generated lithographic masks. Another, more recently developed method is Dry Photopolymer Embossing (DPE). This replication process uses master holograms. And now, diamond turning is being applied for the machining of these elements. Diamond turning is especially well suited for infrared optics. As any process has advantages and limitations, so has diamond turning. These advantages and limitations are discussed and general guidelines are presented to aid the designer and systems engineer in the project predesign stage. Author

OPTICAL SYSTEM STORAGE DESIGN WITH DIFFRACTIVE OPTICAL ELEMENTS

Raymond K. Kostuk and Charles W. Haggans (Minnesota Mining and Mfg. Co., Vadnais.) *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 387-394 (For primary document see N94-17331 03-74)

Avail: CASI HC A02/MF A04

Optical data storage systems are gaining widespread acceptance due to their high areal density and the ability to remove the high capacity hard disk from the system. In magneto-optical read-write systems, a small rotation of the polarization state in the return signal from the MO media is the signal which must be sensed. A typical arrangement used for detecting these signals and correcting for errors in tracking and focusing on the disk is illustrated. The components required to achieve these functions are listed. The assembly and alignment of this complex system has a direct impact on cost, and also affects the size, weight, and corresponding data access rates. As a result, integrating these optical components and improving packaging techniques is an active area of research and development. Most designs of binary optic elements have been concerned with optimizing grating efficiency. However, rigorous coupled wave models for vector field diffraction from grating surfaces can be extended to determine the phase and polarization state of the diffracted field, and the design of polarization components. A typical grating geometry and the phase and polarization angles associated with the incident and diffracted fields are shown. In our current stage of work, we are examining system configurations which cascade several polarization functions on a single substrate. In this design, the beam returning from the MO disk illuminates a cascaded grating element which first couples light into the substrate, then introduces a quarter wave retardation, then a polarization rotation, and finally separates s- and p-polarized fields through a polarization beam splitter. The input coupler and polarization beam splitter are formed in volume gratings, and the two intermediate elements are zero-order elements. Derived from text

THEORY OF DISPERSIVE MICROLENSES

B. Herman and George Gal *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 395-408 (For primary document see N94-17331 03-74)

Avail: CASI HC A03/MF A04

A dispersive microlens is a miniature optical element which simultaneously focuses and disperses light. Arrays of dispersive mircolenses have potential applications in multicolor focal planes. They have a 100 percent optical fill factor and can focus light down to detectors of diffraction spot size, freeing up areas on the focal plane for on-chip analog signal processing. Use of dispersive microlenses allows inband color separation within a pixel and perfect scene registration. A dual-color separation has the potential for temperature discrimination. We discuss the design of dispersive microlenses and present sample results for efficient designs. Author

COLOR SEPARATION GRATINGS

Michael W. Farn and Robert E. Knowlden *In* NASA. Marshall Space Flight Center, Conference on Binary Optics: An Opportunity for Technical Exchange Aug. 1993 p 409-421 (For primary document see N94-17331 03-74)

Avail: CASI HC A03/MF A04

In this paper, we describe the theory, fabrication and test of a binary optics 'echelon'. The echelon is a grating structure which separates electromagnetic radiation of different wavelengths, but it does so according to diffraction order rather than by dispersion within one diffraction order, as is the case with conventional gratings. A prototype echelon, designed for the visible spectrum, is fabricated using the binary optics process.

Tests of the prototype show good agreement with theoretical predictions.

[A TYPICAL POINTED OBSERVATION IN IRAS DESIGNED TO FIT INTO A 15 MINUTE WINDOW] Final Report, 1 Aug. 1992 - 31 Jul. 1993
G. Neugebauer and D. Gregorich 18 Nov. 1993 3 p
(Grant NAG5-1710)

A typical pointed observation in the Infrared Astronomical Satellite (IRAS) was designed to fit into a 15 minute window. Observing constraints, however, did not always permit targets from the scientific program to be observed on exactly 15 minute centers and a few months into the mission it was realized that the automatic scheduling program left times when no observations were being made. In order to use this potentially wasted observing time, a mode of pointed observations, the 'filler' mode, with shorter observation duration was initiated. Locations were picked on an arbitrary grid, spaced relatively uniformly in ecliptic coordinates, and the telescope was pointed to one of these sites whenever a gap potentially occurred. One of us (GXN) was the coordinator of this effort (the FL sub-group). There are a total of 22 FL fields, 13 of which have more than 50 component observations. These 13 fields cover about 30 square degrees. It was proposed to concentrate on one filler field, FL29, a field with 53 coverages which thus had among the deepest coverage of those observed in this mode. This field was also observed extensively at various non-infrared wavelengths by a variety of techniques. Because the IRAS observations of FL29 were made at the limits of the survey sensitivity and at different twist angles it was necessary to make significant technical advances in the methods used in the processing and analyzing the data. In particular, if normal IRAS coaddition procedures were used, the noise resulting from coaddition of the multiple frames did not decrease in the manner expected once significantly different twist angles were included in the coaddition. The technical effort needed to reduce the observations of FL29 was completed and now the noise behavior is understood and well behaved. The reduction of the field FL29 observations is done.

We performed optical studies of organic dye doped glasses and rare earth ion doped glasses. We doped several organic dyes in boric acid, sucrose, and polycarbonate hosts and detected phase conjugate signals from all these samples. Sucrose samples are hygroscopic and hence are useful for characterizing dyes only. Boric acid samples were damaged even at moderate laser powers. On the other hand polycarbonate samples could withstand high input powers and hence will be useful in device applications. Styryl 7 doped boric acid sample exhibited several interesting nonlinear optical phenomena and was also found to be useful for long-term/permanent information storage due to photochemical effects undergone by the excited molecules. PC signals in Pyridine 1 dye doped samples exhibited oscillations (period-hour) which was found to be due to thermal effects/large Stokes shift in the emission. DCM and RI 10 doped boric acid samples are found to be chemically stable even after three years. We measured third order susceptibilities of DCF, DCM, RIIO, AY, and R6G doped samples. We experimentally demonstrated that excited state absorption alters the transmission/saturation characteristics of the dyes in condensed media. These results have been published in three journal papers.

Hardware and software of the cooling water calorimetry and the wall thermometry diagnostics at the tokamak ASDEX-Upgrade are described. These diagnostics were used to analyze the energy deposition on the first wall elements in ASDEX-Upgrade. The cooling water calorimetry system consists of 130 platinum resistor thermometers Pt-100 and 27 annular flow meters located in the cooling water system of the tokamak downstream and upstream near the individual cooling units. In addition to the cooling water calorimetry system in some sections of the torus a wall thermometry diagnostic was installed to reach a higher poloidal resolution of the energy deposition measurements. The electrical measuring signals from the sensors were amplified, converted into digital signals, multiplexed with a frequency of 500 Hz, and sent over a fiber optics system into the control room. There a transputer system consisting of five T800 transputers receives the signals and stores a complete set of data about every three seconds during the 10 minute pause between the shots. These raw data were sent into the data analysis system of the experiment and the deposited energy for each cooling unit was calculated. First experimental results of the cooling water calorimetry show toroidal and poloidal asymmetries in the energy deposition in the ASDEX-Upgrade walls. ESA

Parametric instabiliies of large amplitude electromagnetic waves are investigated in fusion applications. In Double Stimulated Brillouin Scattering (DSBS), both the incoming and the reflected pump wave scatter from a common ion sound wave. The stationary states and the dynamics of DSBS are investigated by using a simple envelope model. The ion sound wave that is excited in DSBS is shown to have soliton like properties. The Stimulated Raman Scattering (SRS) of free electron laser radiation can be applied to current drive in tokamaks. The feasibility of the Raman current drive in tokamaks is investigated theoretically. The energy transfer to the fast electrons from the electrostatic wave is studied with relativistic Vlaslov-Maxwell simulations. The parametric decay of a wave to half harmonics is investigated. It is shown that the growth rate of the decay vanishes in the limit of a long wavelength even for general decay modes. For individual titles, see N94-15205 through N94-15211.

Copyright Avail: CASI HC A02/MF A02

To explain discrepancies between experiments and standard theories of stimulated Brillouin scattering, a parametric process called Double Stimulated Brillouin Scattering (DSBS) was developed. In DSBS the incident pump wave is reflected from the critical surface and the two waves scatter from a common ion wave. Some of the properties of DSBS are reviewed. Complete formulary for calculating the stationary eigensolutions of the fields and the eigenvalues of the reflection coefficients and oscillation frequencies is presented. The approach allows inhomogeneous plasma density and temperature. Temperature gradient effects are studied. Numerical solutions including the temporal variation of the ion wave show that the fields start to pulsate above a critical intensity. The backscattering and specular reflections in DSBS develop into regular pulse trains. ESA

The pump wave reflected from the overdense plasma may play an important role in the dynamics of stimulated Brillouin scattering. The particular case of Double Stimulated Brillouin Scattering (DSBS) is studied. In DSBS the incident pump wave and the reflected pump wave scatter from a common ion acoustic wave. Some steady state properties of DSBS are reviewed. The analysis of DSBS dynamics is based on a series of 'numerical experiments'. At small pump intensities the system asymptotically approaches a true steady state. When the intensity is increased the solution turns into a regular pulse train with intensity dependent period. Connections between the pulses and soliton like solutions of a damped sine Gordon equation are discussed. ESA

Copyright Avail: CASI HC A01/MF A02

Some results of numerical and analytical investigations in soliton like behavior occurring in Double Stimulated Brillouin Scattering (DSBS) are reviewed. The soliton-like properties of the ion acoustic wave in DSBS are investigated. It is shown that the ion wave area obeys a damped sine Gordon equation. During propagation the total area of the ion acoustic pulse is approximately (+/-) pi/2 and the shape of the pulse resembles a hyperbolic secant. The pulse height equals its inverse width and its length increases with increasing pump intensity. In the 'numerical experiments' any sign of chaotic behavior of the scattering, and any evidence of transitions between the fundamental and the higher order modes were observed. The

boundaries seem to play an important role in the dynamics of the system. The pulsation of the ion wave is due to the boundaries and the continuous feeding of pump energy into the system. ESA

Copyright Avail: CASI HC A03/MF A02

Current drive in reactor grade tokamak plasmas with a pulsed, high power Free Electron Laser (FEL) is investigated. The stimulated Raman process generates fast, longitudinal electron plasma waves which accelerate electrons to relativistic energies. The fast electrons with parallel velocities much greater than perpendicular velocities are not trapped toroidally and the resulting current decays slowly. A systematic study on different combinations of Raman forward and backward scattering and FEL polarization is presented. The optimal FEL frequencies fall within the range 2.2 to 4 omega sub p and 3.8 to 7 omega sub p. In a reactor grade plasma the best current drive efficiency is obtained by using the stimulated Raman forward process and a left circularly polarized FEL beam. The FEL driven current can be localized to the plasma center and amplified by the bootstrap effect to further enhance the overall efficiency. Raman current drive in high temperature reactor plasma is quite different from small scale experiments with the electron temperature approximately equal to 1 keV, where the Raman backward process dominates and the current drive efficiency remain rather low. ESA

CURRENT DRIVE WITH FREE ELECTRON LASERS IN HIGH AND LOW TEMPERATURE TOKAMAKS

T. J. H. Pattikangas, S. J. Karttunen, and R. R. E. Salomaa (Helsinki Univ. of Technology, Espoo, Finland.) *In its* Studies on the Parametric Decay of Waves in Fusion Plasmas 1992 9 p Repr. from Societa Italiana di Fisica, 1992 p 503-510 Presented at High Power Microwave Generation and Applications Course and Workshop, Varenna, Italy, 9-17 Sep. 1991 Sponsored by Finnish Cultural Foundation (For primary document see N94-15204 03-75)

Copyright Avail: CASI HC A02/MF A02

The requirements for the Free Electron Laser (FEL) performance in Stimulated Raman Scattering (SRS) current drive tokamaks are investigated. High power FEL's are promising power sources for current drive in tokamak plasmas. The high intensities of FEL's make it possible to excite fast electrostatic waves in nonlinear wave-wave interactions, such as SRS and beat wave process. At high and at low temperatures, better efficiencies are obtained with left circularly polarized beams than with right circularly polarized beams. The performance requirements for FEL's are less stringent in the left circularly polarized case than in the right circularly polarized case. In MTX size tokamaks, the needed average and peak power, pulse energy and repetition rate are not much higher than those of the present day FEL's. The FEL's that are needed in reactor size tokamaks are still beyond the present state of the art. FEL's with higher peak powers and pulse energies have to be developed in order to drive a current of 15 MA in a tokamak reactor. ESA

(TKK-F-A704; ISBN-951-22-1091-6) Copyright Avail: CASI HC A03/MF A02

Stimulated Raman forward scattering in a high temperature, magnetized plasma is investigated with relativistic Vlasov-Maxwell simulations and with envelope and test particle calculations. The parameters correspond to Raman current drive by free electron lasers in reactor trade tokamak plasmas. The phase velocity of the Raman excited plasma wave is large. The electron plasma wave grows to a large amplitude and accelerates electrons to high energies. Simultaneous pump depletion weakens the driving ponderomotive force. Spatially the wave-particle interaction takes place in a distance of a few wavelengths of the plasma wave. The electron energies can largely exceed the kinetic energy at the phase velocity of the electron plasma wave. Short wavelength amplitude modulations of the plasma wave appears at high amplitudes. Efficient generation of the nonresonant anti-Stokes wave and of the second Stokes wave are also observed. Analytical growth rates and envelope calculation explain the early evolution of the Raman process. Later on nonlinear wave-particle interactions and relativistic effects start to dominate and the system is not satisfactorily described by simple envelope equations. ESA

ON THE DECAY OF A DIPOLE PUMP WAVE TO HALF-HARMONICS

J. A. Heikkinen, T. J. H. Pattikangas (Helsinki Univ. of Technology, Espoo, Finland.), and G. Devillers (Joint European Torus Project, Abingdon, England.) *In its* Studies on the Parametric Decay of Waves in Fusion Plasmas 1992 6 p Repr. from Journal of Plasma Physics, v. 46, pt. 2, 1991 p 231-236 (For primary document see N94-15204 03-75)

Copyright Avail: CASI HC A02/MF A02

Starting from a three wave interaction coefficient for a homogeneous Vlasov plasma, it is shown that the parametric decay to half harmonics has zero growth rate if the wavenumber of the pump wave vanishes. This result is valid for electromagnetic decay waves to any order in ion or electron Larmor radius. An earlier proof of this fact for electrostatic decay modes is thus extended to a general case. As an application, the decay of a fast magnetosonic wave to two slow waves was studied in the cold plasma approximation. Simple analytical expressions for the coupling coefficient were found for a finite wavenumber of the pump wave as well as with a finite difference between the decay wave frequencies. ESA

The object of this work is to create dense plasmas for research and development that are accessable--not confined in vacuum systems. The corona method of production by high D.C. and A.C. voltages is simple and convenient. Much work was done in this field in the 1900-1940 time frame, but the field seems to be neglected now. Multiple points were used on positive and negative electrodes at voltages of 6000 to 1200 volts D.C. The current appears to comprise equal negative and positive ion species, as an metal plate blocking the current flow reduced the current exactly to 1/2 of its initial value. An electrostatic voltmeter (zero current drain) was used to obtain the potential profiles. DTIC

ITER-HARD TOROIDAL FIELD COIL STRUCTURAL ANALYSIS

S. J. Wineman 15 Oct. 1992 17 p

(Contract W-7405-eng-48)

(DE93-014834; UCRL-ID-111954) Avail: CASI HC A03/MF A01

The High Aspect Ratio Design (HARD) for the International Thermonuclear Experimental Reactor (ITER) has Toroidal Field (TF) coils that are farther out from the center of the Toroidal ring and more elongated than the previous design (CDA). These coils should see higher forces than in CDA and were designed accordingly. The objective of this work, conducted at LLNL and the MIT Plasma Fusion Center, was to determine whether stress levels in the ITER-HARD design are acceptable. A global finite element model, representing one of the coils, was modeled at MIT to obtain stresses and displacements both during operation of the TF coils

alone and during the End of Burn phase with TF and PF (Poloidal Field) coils operating. At LLNL, a detailed model of the TF coil straight leg near the equator was used to obtain stresses and displacements during TF operation only. Further detailed analysis of the winding pack of this model was done to estimate stress concentrations in the conduit and insulation. DOE

This paper describes a method of extracting energy from the fusion events occurring between the collision of a beam of protons with a beam of ions of Boron 11. The two beams are circulating in separated and intersecting storage rings where they collide head-on in a common long-straight section. Requirements on the beam parameters in the collider are presented. Limitations due to space-charge forces are discussed; it is found necessary to provide beam-charge neutralization with electrons. The paper discusses also the effects of Coulomb scattering between particles of the same beam and in the opposing beams. Methods are proposed for the controlling of the electromagnetic interaction. The edge fluctuations play a critical role in the overall tokamak confinement. Experiments on TEXT show that electrostatic fluctuations in the edge plasma are the dominant mechanism for energy and particle transport. The basic mechanisms responsible for the edge turbulence are the subject of ongoing research in fusion devices. To understand the driving forces responsible for edge fluctuations, a novel experiment is underway on TEXT to actively modify the turbulence at the plasma edge by launching waves using electrostatic probes in the shadow of the limiter. This technique permits active probing of the spectral properties of the edge turbulence. This new approach to the study of edge fluctuations can provide more insight into the basic dynamics of the turbulence and may, in turn, enable detailed comparison with the theory. These experiments, which rely on the use of oscillating electric fields at the plasma edge, complement edge fluctuation control studies that are presently limited to the use of applied dc biasing to influence the edge electric field profile. These experiments have been extended to control of the edge plasma fluctuation level, using feedback to explore its effects on the edge turbulence characteristics as well as on confinement. DOE

HIGH BETA AND CONFINEMENT STUDIES OF TFTR
G. A. Navratil, A. Bhattacharjee, R. Iacono, M. E. Mauel, S. A. Sabbagh (Columbia Univ., New York, NY.), and J. Kesner (Massachusetts Inst. of Tech., Cambridge.) 1993 49 p
(Contract DE-FG02-89ER-53297)
(DE93-016204; DOE/ER-53297/5) Avail: CASI HC A03/MF A01

The projects discussed in this report are as follows: enhanced high poloidal beta operation in TFTR with deuterium pellet injection; approaching high Q by utilizing high (beta)(sub p) operation in TFTR; advanced tokamak regime experiment; and second regime studies at large major radius high (beta)(sub p) plasmas. Analysis of the data taken during these experiments as well as continuing analysis of earlier data led to a number of important results described in publications in the past year including two invited presentations at the 1992 American Physical Society Division of Plasma Physics Meeting in Seattle, an oral presentation at the 1992 IAEA Meeting in Wuertzburg, Germany, and a Physical Review Letter. These results included the following: extending the high 11/2 regime to 1.2 MA current and neutron production rates to more than 3 x 10(exp 16)/sec; the first experiments with 4 sec neutral beam injection on TFRR; the creation of the first beam and bootstrap current sustained plasmas on TFTR for more than a current relaxation time scale; the first observation of ideal NM ballooning modes in a large tokamak; and production of plasmas with the inner 3/4 of the plasma in or with stable access to the second stability regime. The principal results of these papers and supporting theory work are summarized. DOE

Pegasus 2 is the upgraded version of Pegasus, a pulsed power machine used in the Los Alamos Above Ground Experiments (AGEX) program. The goal of the program is to produce an intense (greater than 100 TW) source of soft x-rays from the thermalization of the KE of a 1 to 10 MJ collapsing plasma source. The radiation pulse should have a maximum duration of several tens of nanoseconds and will be used in the study of fusion conditions and material properties. This paper addresses z-pinch experiments done on a capacitor bank where the radiating plasma source is formed by an imploding annular aluminum foil driven by the J X B forces generated by the current flowing through the foil. (Contract DE-AC03-89ER-51114)
(DE93-014411; GA-A-21293; CONF-9304112-15) Avail: CASI HC A01/MF A01

Current drive during second harmonic, electron cyclotron heating experiments performed on the T-10 tokamak have been simulated with the ONETWO transport code to determine the effects of induction on the time evolution of the loop voltage and current density profile. Ray tracing shows the well focused RF power can generate centrally peaked current densities which exceed the Ohmic current densities by a factor of five, causing very peaked plasma current profiles which will be unable to sawteeth. A Kadomtsev model of the sawtooth shows that a limit cycle is quickly reached which maintains a broad current profile and requires generation of a negative dc component of the loop voltage localized near the magnetic

axis. This negative electric field effectively drive efficiency. A broader profile of driven current, as in the fundamental current drive experiment on T-10, would not suffer this effect. DOE

RECENT RESULTS FROM THE 60 GHz INSIDE LAUNCH ECH SYSTEM ON THE D3-D TOKAMAK
T. C. Luce, C. C. Petty, R. Prater, R. W. Harvey, Y. R. Lin-Liu, J. Lohr, K. Matsuda, C. P. Moeller, and R. A. James (Lawrence Livermore National Lab., CA.) Nov. 1992 31 p Presented at the EC 8th Joint Workshop on Electron Cyclotron Emission and Electron Cyclotron Heating, Gut Ising, Germany, 19-21 Oct. 1992
(Contracts DE-AC03-89ER-51114; W-7405-eng-48)
(DE93-013027; GA-A-21134; CONF-9210300-3) Avail: CASI HC A03/MF A01

Electron cyclotron heating (ECH) is a useful tool in global transport and local confinement studies. Operational experience with the inside launch ECH system on DIII-D shows that reliable operations are possible with power densities up to 0.7 GW/m(sup 2) in vacuum waveguide. Global confinement is roughly predicted by the Rebut-Lallia or ITER-89P scaling law, but direct analysis indicates a nearly linear scaling with toroidal field not found in these scaling laws. Local transport studies with off-axis heating clearly show inward transport in the electron fluid. This implies that diffusive and critical gradient models cannot completely describe plasma transport. DOE

STRUCTURE AND DAMPING OF TOROIDAL DRIFT WAVES (AND THEIR IMPLICATIONS FOR ANOMALOUS TRANSPORT)
J. B. Taylor, J. Connor (United Kingdom Atomic Energy Authority, Abingdon, England.), and H. R. Wilson (United Kingdom Atomic Energy Authority, Abingdon, England.) May 1993 14 p
(Contract DE-FG05-80ET-53088)
(DE93-014005; DOE/ET-53088/605; IFSR-605) Avail: CASI HC A03/MF A01

The conventional theory of high-n toroidal drift waves, based on the ballooning representation, indicates that shear-damping is generally reduced in a torus compared to its plane-slab value. It therefore describes the most unstable class of toroidal drift waves. However, modes of this type occur only if the diamagnetic frequency omega*(r) has a maximum in r, and they affect only a small fraction, Omicron(1/n(sup 1/2)), of the plasma radius around this maximum. Consequently they may produce little anomalous transport. In the present work we show that, within the ballooning description, there is another class of toroidal drift waves with very different properties to the conventional ones. The new modes have greater shear-damping (closer to that in a plane-slab) than the conventional ones and so have a higher instability threshold. However, they occur for any plasma profile and at all radii, and they have larger radial extent. Consequently they may produce much greater anomalous transport than the possibly benign conventional modes. This suggests a picture of anomalous transport in which the plasma profile is determined by marginal stability, but marginal to the new class of modes not to the conventional ones. This might explain why marginally stable profiles calculated for drift waves with plane-slab damping sometimes agree well with the profiles in toroidal experiments. It is also consistent with the fact that experimental profiles may exceed conventional toroidal instability thresholds. The new modes may also be related to the long radial structures which appear in some plasma simulations and in experiments. DOE

SIMULATION OF ENHANCED TOKAMAK PERFORMANCE ON D3-D USING FAST WAVE CURRENT DRIVE
J. S. deGrassie, Y. R. Lin-Liu, R. I. Pinsker, V. S. Chan, R. Prater, H. St.John, F. W. Baity (Oak Ridge National Lab., TN.), R. H. Goulding (Oak Ridge National Lab., TN.), D. J. Hoffman (Oak Ridge National Lab., TN.), and C. C. Petty May 1993 4 p Presented at the 20th European Conference on Controlled Fusion and Plasma Physics, Lisbon, Portugal, 26-30 Jul. 1993
(Contracts DE-AC03-89ER-51114; DE-AC05-84OR-21400)
(DE93-014009; GA-A-21312; CONF-930720-2) Avail: CASI HC A01/MF A01

The fast magnetosonic wave is now recognized to be a leading candidate for noninductive current drive for the tokamak reactor due to the ability of the wave to penetrate to the hot dense core region. Fast wave current drive (FWCD) experiments on D3-D have realized up to 120 kA of RF current drive, with up to 40% of the plasma current driven noninductively. The success of these experiments at 60 MHz with a 2 MW transmitter source capability has led to a major upgrade of the FWCD system. Two additional transmitters, 30 to 120 MHz, with a 2 MW source capability each, will be added together with two new four-strap antennas in early 1994. Another major thrust of the D3-D program is to develop advanced tokamak modes of operation, simultaneously demonstrating improvements in confinement and stability in quasi-steady-state operation. In some of the initial advanced tokamak experiments on D3-D with neutral beam heated (NBI) discharges it has been demonstrated that energy confinement time can be improved by rapidly elongating the plasma to force the current density profile to be more centrally peaked. However, this high-l(sub i) phase of the discharge with the commensurate improvement in confinement is transient as the current density profile relaxes. By applying FWCD to the core of such a (kappa)-ramped discharge it may be possible to sustain the high internal inductance and elevated confinement. Using computational tools validated on the initial DM-D FWCD experiments we find that such a high-l(sub i) advanced tokamak discharge should be capable of sustainment at the 1 MA level with the upgraded capability of the FWCD system. NONLINEAR GYROFLUID MODELS OF SHEAR ALFVEN INSTABILITIES IN IGNITED AND BEAM HEATED TOROIDAL PLASMAS
D. A. Spong, C. L. Hedrick, and B. A. Carreras 1993 20 p Presented at the International Atomic Energy Agency (IAEA) Technical Committee Meeting, Trieste (Italy), 10-14 May 1993
(Contract DE-AC05-84OR-21400)
(DE93-016235; CONF-9305231-1) Avail: CASI HC A03/MF A01

Shear Alfven instabilities driven by energetic beams and alpha populations are investigated using a reduced MHD-gyrofluid model with Landau closure. The moment equations for the fast ions are truncated in a way which incorporates the wave particle resonances that are required to destabilize the shear Alfven mode. These are coupled to an Ohm's law and vorticity equations which have been generalized to include ion FLR, electron and ion Landau damping. This model has been applied to experimentally observed regimes in a number of tokamak and stellarator devices. Both linearized growth rates and the nonlinear evolution are obtained. The saturated nonlinear regimes indicate mode number and frequency spectra which are generally consistent with experiment. A detailed examination of one typical nonlinear state has allowed identification of the dominant saturation mechanisms. This indicates that generation of $n = 0$, $m = 0$ sheared poloidal velocity flows and quasi linear modification of the q(r) profile can be important factors in reaching saturation. DOE

ARIES TOKAMAK REACTOR STUDY
D. Steiner Jul. 1993 10 p
(Contract DE-FG02-85ER-52118)
(DE93-017059; DOE/ER-52118/8) Avail: CASI HC A02/MF A01

This report examines the feasibility of a standard poloidal diverter design for ARIES-2/4 with the determination of the peak thermal loading on and the plasma temperature facing a poloidal double null diverter. The ARIES-2/4 reactors produce 2,141 MW of fusion power of which 1712 MW is contained in the neutron channel. Of the remaining 429 MW of charged particle power, 47 MW is radiated from the core by bremsstrahlung and synchrotron modes to the vessel walls. The remaining 382 MW of charged particle or transport power crosses the core/edge interface. The fact that the bulk of the power is contained in the neutron channel makes the application of a poloidal divertor possible. The ARIES-2/4 diverter constraints for peak heat load and peak particle temperature are set by current technology and materials knowledge. Divertor geometry constraints are imposed by the plasma equilibrium and the 2/4 vacuum vessel. The diverter heat load and plasma temperatures are determined from edge particle and energy balances. These balances are important characteristics of the plasma edge because the transport power from the plasma core must pass through the edge and be deposited on tokamak components.

The Braams' B2 code is a multifluid ion and electron energy and momentum transport code for the plasma edge and is adopted for the design of the ARIES-2/4 diverter. DOE

INVESTIGATION OF ONSET OF PLASMA FORMATION AT ANODE OF FAST-PULSED HIGH-VOLTAGE VACUUM DIODE M.S. Thesis
Gregory Willis Mar. 1993 62 p
(AD-A267214) Avail: CASI HC A04/MF A01

The mechanism by which plasma forms in a fast pulsed high vacuum diode has been greatly studied. For the most part, efforts have been concentrated on plasma formation at the cathode. Recently, investigators improved the popular explosive emission model, taking into account the ion current density and surface heating through ion bombardment. This model provides total current densities of the order necessary for exploding whiskers on the cathode surface, and explains the cathode spot phenomena. The general belief is that a fast pulsed high voltage diode event is dominated by cathodic processes, and little research into plasma formation at the anode has been conducted. This study presents experimental results which support the above model applied to both the cathode and anode regions of the diode. It is shown here that plasma formation does indeed take place in the anode region, and that the formation occurs nearly simultaneously with plasma formation at the cathode. Also, photographic evidence of postbreakdown cratering on the anode surface, similar to the cathode spot phenomena, is presented. DTIC

(DE93-018142; DOE/ER-53279/3) Avail: CASI HC A01/MF A01

The Plasma Science Committee (PLSC) of the National Research Council (NRC) is charged with monitoring the health of the field of plasma science in the United States, and it identifies and examines both broad and specific issues affecting the field. Regular meetings, teleconferences, briefings from agencies and the scientific community, the formation of study panels to prepare reports, and special symposia are among the mechanisms used by the PLSC to meet its charge. During July 1992, the PLSC sponsored a workshop on nonneutral plasmas in traps. Although no written report on the workshop results was prepared for public distribution, a summary of highlights was provided to the OPST Subpanel on Nonneutral Plasmas. The PLSC also continued its follow-up briefings and discussions on the results of the results of the report 'Plasma Processing of Materials: Scientific and Technological Opportunities'. As a result of these activities, the Committee is now working with the NRC Committee on Atomic, Molecular, and Optical Sciences (CAMOS) to organize a symposium on database needs in plasma processing of materials. SPECTROSCOPIC AND COMPUTER MODELING INVESTIGATIONS OF A LASER-SUSTAINED PLASMA [BADANIA SPEKTROSKOPOWE I MODELOWANIE NUMERYCZNE PLAZMY PODTRZYMYWANEJ LASEREM]
Zygmunt Szymanski 1991 74 p In POLISH
(IFTR-30/1991) Avail: CASI HC A04/MF A01

Results from a spectral analysis of a laser-generated plasma are presented. The studies were carried out in argon at a pressure of 10 atm under both steady-state conditions and during the decay and new accumulation of plasma. The local thermodynamic equilibrium conditions are stipulated together with problems associated with determining plasma parameters based on measurements of constant radiation intensity and spectral line measurements. A quasi-two-dimensional cylindrical model is employed to describe the theoretical laser-generated plasma; this model provides a good description of laser-generated plasma under natural convection conditions and likewise by modification under forced convection conditions. The effect of the laser packet geometry and the inlet rate of the working gas on laser radiation absorption by the plasma at atmospheric pressure was also analyzed. Transl. by FLS

A STATE-OF-THE-ART PLASMA POLYMERIZATION COATER FOR ICF TARGETS
G. Devine, S. Letts, R. Cook, and R. Brusasco Dec. 1992 6 p Presented at the 205th American Chemical Society National Meeting, Denver, CO, 28 Mar. - 2 Apr. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-48)
(DE93-016452; UCRL-JC-112360; CONF-930304-29) Avail: CASI HC A02/MF A01

Increasingly stringent demands on the characteristics of plasma polymer coatings for use in Inertial Confinement Fusion (ICF) experiments have created a need for a plasma polymerization coating system with the capability of producing a wide variety of different types of coatings as well as one that can be used to do fundamental investigations of the process conditions leading to desirable films. We report on the construction and use of just such a coating instrument. We have recognized the usefulness of computer assisted process monitoring and control, currently being developed by the semiconductor industry, in designing our own, state-of-the-art plasma polymerization device. Our system is fully computer interfaced to provide the user with the capability of collecting system parameter data over the length of the deposition experiment. The system is also designed to allow for any degree of computer control of the deposition process in the future. DOE

STATIC CHARACTERISTICS OF A CONDUCTION AND RADIATION DOMINATED ELECTRIC ARC IN NITROGEN
J. Jenista Jul. 1992 37 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-627106; IPPCZ-323) Avail: CASI HC A03 (US Sales Only)

The time-dependent energy and circuit equations are solved numerically to obtain temperature profiles, current-voltage characteristics and electric field strength vs. axis temperature diagrams in the asymptotic region of a wall-stabilized electric arc operated in nitrogen. The numerical calculations demonstrate the splitting of the rising branch of the stationary solutions in the current-voltage characteristic. This phenomenon was earlier found experimentally for air. The computations were made for various channel radii and for various series resistances. The steady-state characteristics and convergence to the single branch of solutions is explained on the basis of the linearized Lyapunov stability theory (LLST). Comparison with available results of other authors shows that the analytical solution based on simple polynomial approximation to thermodynamic and transport functions differs significantly from numerical computations. PLASMA INSTABILITIES AND TRANSPORT IN THE MPD THRUSTER Final Technical Report, 1 Feb. 1991 - 1993
Edgar Y. Choueiri, Arnold J. Kelly, and Robert G. Jahn Jun. 1993 53 p
(Grant AF-AFOSR-0162-91)
(AD-A268268; AFOSR-93-0569TR) Avail: CASI HC A04/MF A01

This study deals with the development and testing of anomalous (turbulent) transport coefficient models that include the effects of plasma turbulence and that can be used in plasma fluid codes for more realistic numerical simulations. The anomalous transport models were derived using

a kinetic description of microinstabilities in the MPD thruster plasma. Nonlinear plasma theory was used under the valid approximation of weak turbulence and the resulting transport models were studied in detail. A strong dependence of anomalous transport on the electron Hall parameter was found. The models were then reduced to a set of compact polynomials ideally suited for inclusion in fluid codes. The usefulness and importance of these models were demonstrated by including them in an advanced plasma fluid code and carrying numerical simulations of realistic MPD thruster flows. The results show the impact of turbulence on various aspects of dissipation in the thruster as well as on the overall propulsive efficiency. Fluid codes that include these models are more accurate engineering tools for the design and study of high efficiency plasma thrusters. DTIC

DYNAMIC BEHAVIOR OF AN ELECTRIC ARC GAS DISCHARGE

J. Jenista Aug. 1992 30 p

(DE93-630197; IPPCZ-324) Avail: CASI HC A03/MF A01 (US Sales Only)

The time-dependent energy and circuit equations are solved numerically to obtain temperature profiles, current-voltage characteristics, and electric field strength vs. axial temperature diagrams in the asymptotic region of a wall-stabilized electric arc operated in nitrogen. Dynamic current-voltage characteristics and transient phenomena of steady state formation during the spark ignition phase are studied. The arc time-constant for free decay is computed and compared with approximate analytical results. It is found that for fixed initial conditions, the arc response to the variable applied voltage is several times longer than the arc time-constant for free decay. DOE

OPTIMAL PULSE MODULATOR DESIGN CRITERIA FOR PLASMA SOURCE ION IMPLANTERS

W. Reass 1993 5 p Presented at the 9th IEEE Pulsed Power Conference, Albuquerque, NM, 21-23 Jun. 1993

(Contract W-7405-eng-36)

(DE93-016465; LA-UR-93-2303; CONF-930616-6) Avail: CASI HC A01/MF A01

This paper describes what are believed to be the required characteristics of a high-voltage modulator for efficient and optimal ion deposition from the 'Plasma Source Ion Implantation' (PSII) process. The PSII process is a method to chemically or physically alter and enhance surface properties of objects by placing them in a weakly ionized plasma and pulsing the object with a high negative voltage. The attracted ions implant themselves and form chemical bonds or are interstitially mixed with the base material. Present industrial uses of implanted objects tends to be for limited-production, high-value-added items. Traditional implanting hardware uses the typical low-current (ma) semiconductor 'raster scan' implanters. The targets must also be manipulated to maintain a surface normal to the ion beam. The PSII method can provide 'bulk' equipment processing on a large industrial scale. For the first generation equipment, currents are scaled from milliamps to hundreds of amps, voltages to -175kV, at kilohertz rep-rates, and high plasma ion densities. DOE

THE EFFECTS OF RADIATION TRANSPORT ON LINE RATIOS USED AS TEMPERATURE AND DENSITY DIAGNOSTIC

S. H. Langer and C. J. Keane Jul. 1992 23 p Presented at the 22nd Anomalous Absorption Conference, Lake Placid, NY, 12-17 Jul. 1992

(Contract W-7405-eng-48)

(DE93-016424; UCRL-JC-110695; CONF-9207204-1) Avail: CASI HC A03/MF A01

The ability to diagnose the conditions of the fuel in an Inertial Confinement Fusion (ICF) capsule is a fundamental requirement for progress in ICF. Current ICF experiments are concentrating on high convergence capsules, and the capsules will be larger on the more powerful lasers that are currently under development. Both of these developments make it harder to diagnose fuel conditions because of the larger column density in the target. This has led to increased interest in the use of line ratios as temperature and density diagnostics. For a line ratio to be a good temperature diagnostic, the ratio must be relatively insensitive to density and vary strongly with temperature. Given the atomic rates, it is relatively easy to find candidate line ratios in the coronal limit where all lines are optically thin. In this paper, the authors consider the effects of optical depth on line ratios. They show that, even if both of the lines used in the ratio are optically thin, the line ratio can depend on optical depth effects if one of the levels involved in the line ratio is pumped by an optically thick line. They present results from several different radiation transport models and attempt to draw conclusions about whether it is possible to calculate the effects of optical depth accurately enough that line ratios can still be used as diagnostics. They also consider the effects of uncertainties in atomic rates on predicted line ratios. DOE

3D AND r,z PARTICLE SIMULATIONS OF HEAVY ION FUSION BEAMS

A. Friedman, D. P. Grote, D. A. Callahan, A. B. Langdon, and I. Haber (Naval Research Lab., Washington, DC.) 21 Aug. 1992 5 p Presented at the 16th International LINAC Conference, Ottawa, Ontario, 23-28 Aug. 1992

(Contracts W-7405-eng-48; DE-AC03-76SF-00098)

(DE93-013417; UCRL-JC-110201; CONF-9208109-84) Avail: CASI HC A01/MF A01

The space-charge-dominated beams in a heavy ion beam driven inertial fusion (HIF) accelerator must be focused onto small (few mm) spots at the fusion target, and so preservation of a small emittance is crucial. The nonlinear beam self-fields can lead to emittance growth; thus, a self-consistent field description is necessary. We have developed a multi-dimensional time-dependent discrete particle simulation code, WARP, and are using it to study the behavior of HIF beams. The code's 3d package combines features of an accelerator code and a particle-in-cell (PIC) plasma simulation. Novel techniques allow it to follow beams through many accelerator elements over long distances and around bends. We have used the code to understand the emittance growth observed in the MBE4 experiment at Lawrence Berkeley Laboratory (LBL) under conditions of aggressive drift-compression. We are currently applying it to LBL's planned ILSE experiments, and (most recently) to an ESQ injector option being evaluated for ILSE. The code's r, z package is being used to study the axial confinement afforded by the shaped ends of the accelerating pulses, and to study longitudinal instability induced by induction module impedance. (AD-A266805) Avail: CASI HC A03/MF A01

In this final technical report we summarize the activity carried out within the present research project, conducted over a three year period, under the sponsorship of the European Research Office of the U.S. Army. The work done covers different areas, namely: (1) Microscopic simulations of solid, amorphous and liquid semiconductors and semimetals, of their defects, vacancies, and surfaces, and of hydrogen diffusion, using Car-Parrinello and related methods; (2) Theory of the electronic and vibrational properties of semiconductors, semiconductor alloys, interfaces, microstructures, and of GaAs - based semiconductor superlattices; (3) Quantum simulations and theory of highly correlated electron systems particularly as models for

high-T (sub c). superconducting materials; The body of the report will briefly outline the work done in each area, and highlight the main achievements which have been made possible by the project. DTIC

CHARACTERIZATION OF InTlSb GROWN BY LOW PRESSURE METALORGANIC CHEMICAL VAPOR DEPOSITION ON GaAs SUBSTRATE
Y. H. Choi, P. T. Staveteig, E. Bigan, and M. Razeghi 1993 11 p
(AD-A266878) Avail: CASI HC A03/MF A01

Optical properties of InTlSb, a new long wavelength infrared material, are investigated. InTlSb/InSb epilayers grown by low-pressure metalorganic chemical vapor deposition on semi-insulating Ga-As substrates were characterized using Auger electron spectroscopy and Fourier transform infrared spectroscopy. Auger electron spectra confirm the presence of Thallium. Transmission measurements at 77 K indicate an absorption shift from 5.5 micrometers for InSb up to 8 micrometers for InTlSb, which is confirmed by photoconductivity measurements. Author (revised)

This effort successfully demonstrated that intercalated graphite fibers are outstanding cathode materials. Such fibers are stable in air at ambient temperature and offer current densities of over 100 Amps/sq cm at 10 volts bias voltage (at 700 K). Ambient temperature cathodes also offer high current capability at somewhat higher bias voltage. Cesiated graphite and diamond both exhibit these characteristics, but graphite intercalation compounds are stable in air whereas the diamond/cesium system is not. The graphite cathodes do not require a cesium reservoir in order to function. DTIC

ELECTRON-MICROSCOPY STUDY OF ANTIPHASE BOUNDARIES IN Cu3Pd AND Fe3Al ALLOYS NEAR THE ORDER-DISORDER TRANSITION Ph.D. Thesis - Paris 6 Univ., 15 Dec. 1992 [ETUDE PAR MICROSCOPIE ELECTRONIQUE DES PAROIS D'ANTIPHASE DANS LES ALLIAGES CU3PD ET FE3AL A L'APPROCHE DE LA TRANSITION ORDRE-DESORDRE]
Christian Ricolleau 1993 202 p In FRENCH
(ONERA-NT-1993-1; ETN-93-94414) Avail: CASI HC A10/MF A03

Order-disorder transitions on a fixed lattice are generally characterized by a loss of symmetry. When the ordered structures are cubic, there is only a loss of translational symmetry which implies the formation, during the ordering process, of translational variants bounded by domain wall so called Antiphase Boundaries (APB). In the particular case of the L1(sub 2) yields Disorder FCC (A1) first order phase transition, the Cu-17%Pd alloy which exhibits a two phase field over 1C was investigated. At low temperature, the APB are perfectly thin. When the temperature increases, a boundary extends over a few atomic planes which become partially disordered. At transition T(sub C), the width of the domain walls becomes macroscopic (divergence) compared to the domain size. This is the wetting phenomenon. In order to characterize the nature of the divergence of the domain wall width, strictly controlled heat treatments were performed in the (T(sub C) - 10 C, T(sub C)) range, the smallest temperature steps being 0.2C. The determination of the quantitative law and the measurements were achieved using carefully constant experimental conditions. The results showed that the APB width diverges logarithmically as -Log(T(sub C) - T) in the wetting regime, as expected theoretically. A thermodynamic model which allows a detailed analysis of the cross over regime occurring between the wetting and the two phase regime was developed. In order to compare a first and a second order phase transition, an in situ heating experiment in the FeAl(27%) alloy was performed. ESA

CONVECTIVE FLOW EFFECTS ON PROTEIN CRYSTAL GROWTH Semiannual Progress Report No. 1, 1 Feb. - 31 Jul. 1993
Franz Rosenberger and Lisa A. Monaco 1993 29 p
(Grant NAG8-950)
(NASA-CR-194560; NAS 1.26:194560) Avail: CASI HC A03/MF A01

The experimental setup for the in-situ high resolution optical monitoring of protein crystal growth/dissolution morphologies was substantially improved. By augmenting the observation system with a temperature-controlled enclosure, laser illumination for the interferometric microscope, and software for pixel by pixel light intensity recording, a height resolution of about two unit cells for lysozyme can now be obtained. The repartitioning of Na(+) and Cl(-) ions between lysozyme solutions and crystals was studied. Quite unexpectedly, it was found that the longer crystals were in contact with their solution, the lower was their ion content. The development of a model for diffusive-convective transport and resulting distribution of the growth rate on facets was completed. Results obtained for a realistic growth cell geometry show interesting differences between 'growth runs' at 1g and 0g. The kinematic viscosity of lysozyme solutions of various supersaturations and salt concentrations was monitored over time. In contrast to the preliminary finding of other authors, no changes in viscosity were found over four days. The experimental setup for light scattering investigations of aggregation and nucleation in protein solutions was completed, and a computer program for the evaluation of multi-angle light scattering data was acquired. (AD-A266744; ARO-26996.8-PH) Avail: CASI HC A03/MF A01

Five different experimental studies are described. Hole burning in chalcogenide glasses: the quantitative form of the hole relaxation depends solely on the average coordination number of the glass independent of chemical composition. PIRSH burning of Tb(3+) in alkaline earth fluoride crystals: these PIRSHs in 'glassy' crystals display the characteristic properties of spectral holes burned in true glasses. NO2(-) ions in alkali halides: four different kinds of vibrational hole burning have been carried out, namely, the hole and antihole in the same absorption line, the antihole removed in frequency from the inhomogeneously broadened line, multiple antiholes, and the burning at one vibrational mode frequency while monitoring the persistent changes produced in the other internal (IR) or external (FIR) modes with a high resolution FT interferometer. Calculations and simulations of vibrational solitons in crystals: the stationary localized mode results for perfect anharmonic crystals are reminiscent of the defect induced local modes studied in the harmonic approximation. KI:Ag(+) vibrational dynamics, first evidence for vibrational solitons: the silver ion in KI is the most thermally unstable lattice-defect combination known. It may result from localized anharmonic modes being released into the lattice.

STRUCTURAL INVESTIGATION OF ELECTROCHEMICALLY ETCHED SILICON

B. J. Heuser (Missouri Univ., Columbia.), S. Spooner, and C. J. Glinka (National Inst. of Standards and Technology, Gaithersburg, MD.) 1992 4 p Presented at the Materials Research Society Symposium, Boston, MA, 2-6 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-015300; CONF-921206-13) Avail: CASI HC A01/MF A01

Small-angle neutron scattering (SANS) measurements of four electrochemically etched, porous (PS) samples have been performed over a wide wavevector transfer (Q) range. The intermediate to high Q results can be modeled with a non-particulate, random phase model. Correlation length scales on the order of 1 to 2 nm thought to characterize the PS skeleton have been deduced from the SANS data. The microstructural anisotropy was studied by tilting two of the samples with respect to the neutron beam. These samples exhibited an asymmetric scattering pattern at intermediate Q (0.1 less than or equal to Q less than or equal to 0.6 nm(exp -1)) in this condition. Photoluminescence spectra from all four samples have been recorded as well. A correlation appears to exist between the SANS and photoluminescence measurements. An x-ray diffraction measurement of one sample demonstrates that the PS layer retains the silicon lattice structure. Significant peak broadening is observed and is interpreted as a quasi-particle size effect. The PS particle size calculated from the x-ray diffraction measurement is equal to the correlation length obtained in the SANS measurement. DOE

Epitaxial trilayer and superlattice structures grown by pulsed laser ablation have been used to study the superconducting-to-normal transition of ultrathin (one and two c-axis unit cells) YBa2Cu3O(7 - x) layers. The normalized flux-flow resistances for several epitaxial structures containing two-cell-thick YBa2Cu3O(7 - x) films collapse onto the 'universal' curve of the Ginzburg-Landau Coulomb Gas (GLCG) model. Analysis of normalized resistance data for a series of superlattices containing one-cell-thick YBa2Cu3O(7 - x) layers also is consistent with the behavior expected for quasi-two-dimensional layers in a highly anisotropic, layered three-dimensional superconductor. Current-voltage measurements for one of the trilayer structures also are consistent with the normalized resistance data, and with the GLCG model. Scanning tunneling microscopy, transmission electron microscopy, and electrical transport studies show that growth-related steps in ultrathin YBa2Cu3O(7 - x) layers affect electrical continuity over macroscopic distances, acting as weak links. However , the perturbation of the superconducting order parameter can be minimized by utilizing hole-doped buffer and cap layers, on both sides of the YBa2Cu3O(7 - x) layer, in trilayers and superlattices. These results demonstrate the usefulness of epitaxial trilayer and superlattice structures as tools for systematic, fundamental studies of high-temperature superconductivity. DOE

The fractional quantum Hall effect is thought to be the result of correlations between electrons induced by their mutual interactions. This paper explores the consequences of these correlations numerically and analytically. The problem is mapped onto the surface of a sphere, so that the number of states in the first Landau level is finite. The following three sections review this geometry, give the matrix elements of the Coulomb interaction, and compare exact wave functions with the Laughlin/Haldane ground state ansatz for fractional fillings 1/m, m an odd integer. While this ansatz accounts for many of the J = 0 ground states found in numerical diagonalizations, it does not explain all such states. To make progress on this problem, a complete characterization of the most general four-particle J = 0 wave function is given, including an algebraic enumeration of the number of such states. This construction provides one example of a 2/3-filled state, the particle-hole conjugate of the 3-particle Laughlin/Haldane m = 3 state. This result suggests a generalization that may give the particle-hole conjugates of all Laughlin/Haldane states of arbitrary N: the construction depends on an equivalence of single-particle spinors of rank N/2 and ones formed by coupling the elementary spinors of N different particles. This result is further generalized to produce a wave function ansatz that may account for other fractional fillings of physical interest. DOE

Palladium is chemically suitable for electric contacts on mercuric iodide detectors for photon and nuclear radiation detection, so the understanding of palladium contacts is important for fundamental and practical scientific purposes. A study has been conducted on the surface morphology of evaporated contacts using atomic force microscopy (AFM) and optical transmission and reflection. Evaporated palladium coatings are typically nonuniform and may deposit selectively on mercuric iodide surface defects. Reflection measurements show that coating thickness and surface treatment affect intensity, position, and shape of a reflected peak characteristic of the mercuric iodide structure. Results indicate that the band gap energy in the surface of the mercuric iodide is lowered by palladium contacts. DOE

ELECTRONIC STRUCTURE AND ENTHALPY OF HYDROGEN AND HELIUM MIXTURES

M. Ross, J. E. Klepeis, K. J. Schafer, and T. W. Barbee, III Nov. 1992 3 p Presented at the International Conference on the Physics of Strongly Coupled Plasmas, Rochester, NY, 17-21 Aug. 1992

(Contract W-7405-eng-48)
(DE93-014128; UCRL-JC-112346; CONF-9208135-7) Avail: CASI HC A01/MF A01

The first local density approximation (LDA) calculations of the electronic structure, equation of state, and enthalpy of mixing were carried out for a number of different compositions of hydrogen and helium in bcc and fcc lattices. These are fully quantum mechanical, self-consistent calculations utilizing state-of-the-art methods of electron band theory, which make no assumptions regarding pressure ionization. The major approximation in the LDA method is that the exchange and correlation energy is given by a free electron functional in terms of the local electron density. The majority of previous mixture calculations start with the assumption that both hydrogen and helium are pressure-ionized so that the electronic structure is approximately that of free or weakly screened electrons in the presence of positive ions. Stevenson used a hard-sphere mixture model for the ions with an ion-ion pseudopotential to account for electron screening and predicted that a mixture containing 7% helium by number, the composition believed to be present in Jupiter and Saturn, would phase separate at a temperature of about 7000 K at 8 Mbar. Subsequent calculations carried out for the fully ionized mixture and for a mixture of screened ions (linear response theory) have all arrived at predictions similar to those of Stevenson. MacFarlane and Hubbard performed Thomas-Fermi-Dirac calculations for mixing enthalpies of hydrogen and helium in bcc and fcc lattices and predicted that phase separation would not occur at any temperature. ROLES OF OXYGEN DEFECTS IN COPPER-OXIDE SUPERCONDUCTORS

J. D. Jorgensen, P. G. Radaelli, H. Shaked, J. L. Wagner, B. A. Hunter, J. F. Mitchell, R. L. Litterman, and D. G. Hinks Apr. 1993 6 p Presented at the International Workshop on Superconductivity, Hokkaido, Japan, 28 Jun. - 1 Jul. 1993

(Contract W-31-109-eng-38)
(DE93-014875; ANL/MSD/CP-79578; CONF-930682-1) Avail: CASI HC A02/MF A01

Oxygen vacancy and interstitial defects can have a profound effect on the superconducting compounds. Recent work on compounds such as La2CuO(4+x) provided new insight into the role of interstitial oxygen defects as a doping mechanism. Studies of (La,Sr,Ca)(3)Cu2O(6+x) with various metal compositions and metal-site ordering show that interstitial oxygen defects that form between the CuO2 layers in this structure systematically lower (Tc) and eventually destroy superconductivity. However, oxygen vacancies in the CuO2 planes have surprisingly little effect at concentrations below 3%. The infinite-layer compounds, ACuO2 where A = La, Sr, Ca, Nd, etc., in solid-solution combinations, offer a very similar environment for the formation of interstitial oxygen defects between the CuO2 planes. However, neutron diffraction experiments on Sr(0.9)La(0.1)CuO2 (T(sub c) = 42 K) have not found any interstitial oxygen. DOE

THE GROWTH OF InAs(1-x)Sb(x)/InAs STRAINED-LAYER SUPERLATTICES BY METAL-ORGANIC CHEMICAL VAPOR DEPOSITION

R. M. Biefeld, K. C. Baucom, and S. R. Kurtz 1993 14 p Presented at the 9th American Conference on Crystal Growth, Characterization and Applications, Baltimore, MD, 1-6 Aug. 1993

(Contract DE-AC04-76DP-00789)
(DE93-015028; SAND-93-0300C; CONF-930851-1) Avail: CASI HC A03/MF A01

InAs(1-x)Sb(x)/InAs strained-layer superlattice (SLS) semiconductors and thick epitaxial layers of InAs(1-x)Sb(x) were grown under a variety of conditions by metal-organic chemical vapor deposition on InAs substrates. The 3/5 ratio was varied from 0.026 to 1.0 over a temperature range of 475-525C, at pressures of 200 to 660 torr and growth rates of 0.75 to 3.0 micron/hour. The composition of the ternary can be predicted from the input gas molar flow rates using a thermodynamic model. At lower temperatures, the thermodynamic model must be modified to take account of the incomplete decomposition of arsine and trimethyl antimony. These layers were characterized by optical microscopy, SIMS, and x-ray diffraction. The optical properties of these SLS's were determined by infrared photoluminescence and absorption measurements. The PL peak energies of the alloys and the SLS's are consistently lower than the previously reported values for the bandgap of InAs(1-x)Sb(x) alloys. DOE

INTERFACIAL STRUCTURE OF LATTICE MISMATCHED BCC(110)/BCC(110) TRANSITION METAL SUPERLATTICES

E. E. Fullerton, C. H. Sowers, S. D. Bader, S. Mini, A. S. Bommannavar (City Univ. of New York, Brooklyn.), and S. N. Ehrlich (Purdue Univ., West Lafayette, IN.) Mar. 1993 7 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 12-16 Apr. 1993

(Contract W-31-109-eng-38)
(DE93-015162; ANL/XFD/CP-79634; CONF-930405-18) Avail: CASI HC A02/MF A01

We present structural characterizations of a series of sputtered Fe/Nb and V/Nb superlattices by high-angle x-ray diffraction. Diffraction scans were performed with the scattering vector at various angles (chi) with respect to the layers. Chi = 0 deg diffraction spectra (normal to the layers) were fitted to a general structural model to determine the (110) lattice strains, interfacial disorder and interdiffusion. Chi greater than 0 deg spectra probe the lattice strain of the individual layers and the in-plane interfacial coherence. Both systems form incoherent interfaces above a critical modulation wavelength (lambda(sub C)). At lambda(sub C), the Fe/Nb system undergoes a crystalline-to-amorphous transition while the V/Nb forms in-plane coherent interfaces. DOE

PHOTOEMISSION STUDY OF DIAMOND (100) SURFACE

J. Wu, R. Cao, X. Yang, P. Pianetta, and I. Lindau Mar. 1993 7 p Presented at the 39th National Symposium of the American Vacuum Society, Chicago, IL, 9-13 Nov. 1992

(Contract DE-AC03-76SF-00515)
(DE93-015251; SU-SLAC-PUB-6078; SLAC/SSRL-0015; CONF-921129-10) Avail: CASI HC A02/MF A01

The electronic structure of the diamond C(100)-(2 x 1)/(2 x 2) has been investigated by means of angle-resolved photoelectron spectroscopy for the first time. A surface-related shift has been observed in the C 1s core level spectrum. The surface-state band dispersion was measured along the symmetry axis Gamma-J' in the surface Brillouin zone. For k(sub (parallel)) = 0, there is a very pronounced surface state 1.5 eV below Fermi level E(sub F), and it disperses downwards with increasing k(sub (parallel)). Near the boundary of the surface Brillouin zone J', we find two states with binding energies of 1.9 and 2.4 eV with respect to E(sub F). DOE

A REEXAMINATION OF GRAIN BOUNDARY FRACTURE IN NI3AL: ENVIRONMENTAL AND ALLOYING EFFECTS

E. P. George, C. T. Liu, and D. P. Pope (Pennsylvania Univ., Philadelphia.) 1993 9 p Presented at the International Symposium on Structural

Intermetallics, Champion, PA, 26-30 Sep. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015431; CONF-930997-2) Avail: CASI HC A02/MF A01

The intrinsic room-temperature ductility (approximately 23 percent) of polycrystalline Ni3Al is considerably higher than previously thought. Environmental embrittlement, caused by moisture in ordinary ambient air, reduces significantly the maximum attainable ductility in air. Microcracks (introduced during processing) can also reduce the maximum attainable ductility in air. A consequence of these extrinsic factors is that polycrystalline Ni3Al is usually found to be quite brittle in air, and very careful experimental procedures are required if its (higher) intrinsic ductility is to be measured. The addition of B essentially suppresses environmental embrittlement in Ni3Al, thereby improving ductility. The substitutional elements Zr and Hf also improve ductility, but Ti (which is from the same group in the periodic table) does not. The mechanism by which Zr and Hf improve ductility is not known, but they appear to both alleviate environmental embrittlement and enhance grain-boundary cohesion. DOE

THIN NI SILICIDE FORMATION BY LOW TEMPERATURE-INDUCED METAL ATOM REACTION WITH ION IMPLANTED AMORPHOUS SILICON

Y. N. Erokhin (North Carolina State Univ., Raleigh.), S. Pramanick (North Carolina Univ., Chapel Hill.), F. Hong (North Carolina State Univ., Raleigh.), G. A. Rozgonyi (North Carolina State Univ., Raleigh.), B. K. Patnaik (North Carolina Univ., Chapel Hill.), and C. W. White 1992 5 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-015449; CONF-921101-126) Avail: CASI HC A01/MF A01

We have extended our recent work on buried silicide formation by Ni diffusion into a buried amorphous silicon layer to the case where silicide formation is at lower temperatures on silicon substrates which have been preamorphized. The reaction of metal atoms from a 12 nm Ni film evaporated on top of a 65 nm thick surface amorphous layer formed by 35 keV Si(+) ion implantation has been investigated at temperature less than or equal to 400 C. Rutherford Backscattering Spectrometry (RBS) with channeling, cross-sectional transmission electron microscopy (XTEM), x-ray diffraction and four-point probe measurements were used to determine structure, interfacial morphology, composition, and resistivity of the silicide films. It has been found that an increased rate of silicidation occurs for amorphous silicon with respect to crystalline areas permitting a selective control of the silicon area to be contacted during silicide growth. Vacuum furnace annealing at 360 C for 8 hours followed by an additional step at 400 C for one hour produces a continuous NiSi2 layer with a resistivity 44 (mu)(Omega) cm. DOE

THE ROLE OF INTERFACIAL CHEMISTRY IN SURFACE NUCLEATION AND GROWTH OF CALCIUM OXALATE

L. Song, A. A. Campbell, and B. C. Bunker 1993 6 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 12-16 Apr. 1993
(Contracts DE-AC06-76RL-01830; DE-FG06-89ER-75522)
(DE93-015689; PNL-SA-22038; CONF-930405-20) Avail: CASI HC A02/MF A01

The surface adsorption of Ca(2+) and oxalate anions Ox(2-) on SiO2, TiO2 and Al2O3 oxide colloids were by electrosonic amplitude measurements. Kinetics studies of CaO(x) formation on the model oxide surfaces were carried out using constant composition method. Results suggested Ca(2+) and Ox(2-) adsorption was promoted on the oxide surfaces with opposite charges, and the specific adsorption of the divalent ions also resulted in surface charge reversal. For heterogeneous nucleation of CaO(x) on the three model oxide surfaces, induction times ranged from 270 to 360 minutes compared with 1200 minutes estimated for homogeneous nucleation and 700 minutes for spontaneous or nucleation at pH 6.5 and S = 3.3. Lower nucleation barriers, 27 mJ/sq m for SiO2, 26 mJ/sq m for TiO2, were observed by studying the dependence of nucleation induction times as the function of solution supersaturation. DOE

CRYSTALLIZATION OF GRAIN BOUNDARY PHASES IN SILICON NITRIDE WITH LOW ADDITIVE CONTENTS BY MICROWAVE ANNEALING

T. N. Tiegs, K. L. Ploetz, J. O. Kiggans, and R. L. Yeckley 1993 11 p Presented at the 95th Annual Meeting of the American Ceramic Society, Cincinnati, OH, 18-22 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015801; CONF-930438-24) Avail: CASI HC A03/MF A01

Microwave annealing of dense Si3N4-4% Y2O3 materials showed improvements over conventional heating. Increases in fracture toughness were observed for annealing between 1200-1650C. The high temperature strength was related to the residual (alpha)-Si3N4 content which is indicative of a finer average grain size in the specimens. The high temperature dynamic fatigue showed increased stress to failure for specimens microwave annealed between 1400-1550C for periods greater than 5 h. Silicon nitrides with different sintering additives would require different conditions for optimum crystallization. While there were some observed property improvements, they were not so dramatic to justify abandoning conventional over microwave heating. The Si3N4-4% Y2O3 materials used in the study were developed for elevated temperature use and already possesses excellent to good high temperature strength, fatigue resistance and creep properties. This is due to the very refractory nature of the grain boundary phases and the small quantity of secondary phase present. However, microwave annealing of these materials may be necessary in applications where the maximum in fracture toughness and fatigue resistance are required and thus justifies its use. DOE

A short review is given of the methods by which mercuric iodide is prepared and purified to obtain material suitable for the growth of single crystals. The method used in our laboratory to grow single crystals up to 1,000 grams in weight from the vapor is discussed. Effects of gravity on the growth process are described. A crystal growth system suitable for operation in the reduced gravity environment of space was designed and crystal growth experiments were performed during the flights of Spacelab 3 (April 1985) and the International Microgravity Laboratory (January 1992). Structural quality and electronic properties of ground-based and space-grown crystals are compared. DOE

LOCAL ENVIRONMENT ABOUT O ATOMS IN Pr-Y-Ba-Cu-O FILMS STUDIED BY O K-EDGE XAFS

A. Krol, Y. L. Soo, S. Huang, Z. H. Ming, L. W. Song, Y. H. Kao, and G. C. Smith (Brookhaven National Lab., Upton, NY.) Sep. 1992 8 p Presented at the 6th Annual New York State Inst. on Superconductivity Conference on Superconductivity and Applications, Buffalo, NY, 15-17 Sep. 1992

(Contracts DE-AC02-76CH-00016; DE-FG02-87ER-45283)
(DE93-016218; BNL-48361; CONF-920944-7) Avail: CASI HC A02/MF A01

The local environment about oxygen atoms in Pr(x)Y(1-x)Ba2Cu3O7 films obtained by laser ablation has been investigated by means of the x-ray absorption fine structure (XAFS) spectroscopy at the O K-edge. It has been found that the Pr atoms do not substitute for the Cu atoms nor do they form interstitial defects in the CuO2 planes and that the presence of Pr dopant does not disturb the local environment of oxygen.

FAST-ICCD PHOTOGRAPHY AND GATED PHOTON COUNTING MEASUREMENTS OF BLACKBODY EMISSION FROM PARTICULATES GENERATED IN THE KrF-LASER ABLATION OF BN AND YBC
D. B. Geohegan Nov. 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-015491; CONF-921101-123) Avail: CASI HC A02/MF A01

Fast intensified CCD photography and gated photon counting following KrF-laser irradiation of YBCO and BN targets reveals the first observations of very weak emission from slow-moving ejecta up to 2 cm from the target and times extending to approximately 1.5 ms. Time-of-flight velocities inferred from the emission measurements indicate velocities (v approximately (0.45-1.2) x 10(exp 4) cm s(exp -1) comparable to those measured for the large particles which often accompany the pulsed laser deposition process. Gated photon counting is employed to obtain temporally resolved spectra of this weak emission. The spectral shape is characteristic of blackbody emission, which shifts to longer wavelengths as the particles cool during flight in vacuum. Estimates of the temperature of the particles are made based on the emissivity of a perfect blackbody and range from 2200 K to 3200 K for both BN and YBCO when irradiated at Phi(sub 248) = 3.5 J cm(exp -2) and 1.5 J cm(exp -2), respectively. The temperature decrease of the particles in vacuum is compared to a radiative cooling model which gives estimates of the initial surface temperature and radii of the particles.

THERMAL DISORDER IN ADSORBED Cl ON Si(100)
C. C. Cheng, Q. Gao, Z. Dohnalek, W. J. Choyky, and J. T. Yates, Jr. 21 May 1993 24 p
(Contract N00014-82-K-0280)
(AD-A266295; TR-56) Avail: CASI HC A03/MF A01

Thermal broadening of Cl(+) ESDIAD patterns, related to the vibrational motion of the adsorbate, has been investigated by subtraction of patterns measured at different temperatures. In the case of Cl on Si(100), the observed difference pattern between 130 K and 305 K indicates that azimuthally isotropic motion of Cl occurs about the most probable Si-Cl bond direction. Equal distributions from the in-plane and out-of-plane bending motions are observed, correlating with the approx 200/cm frequencies associated with these motions.

APPARATUS FOR AND A METHOD OF GROWING THIN FILMS OF ELEMENTAL SEMICONDUCTORS Patent
Max N. Yoder, inventor (to Navy) 6 Jul. 1993 16 p Filed 22 Jun. 1990
(AD-D015813; US-Patent-5,225,366; US-Patent-Appl-SN-541990;
US-Patent-Class-437-108) Avail: US Patent and Trademark Office

An apparatus for and a method of growing thin films of the elemental semiconductors (group IVB), i.e., silicon, germanium, tin, lead. and, especially diamond, using modified atomic layer epitaxial (ALE) growth techniques are disclosed. In addition, stoichiometric and nonstoichiometric compounds of the group IVB elements are also grown by a variation of the method according to the present invention. The ALE growth of diamond thin films is carried-out, inter alia, by exposing a plurality of diamond or like substrates alternately to a halocarbon reactant gas, e.g., carbon tetrafluoride (CF4), and a hydrocarbon reactant gas, e.g., methane (CH4), at substrate temperatures between 300 and 650 C. A stepping motor device portion of the apparatus is controlled by a programmable controller portion such that the surfaces of the plurality of substrates are given exposures of at least 10(exp 15) molecules/sq cm of each of the reactant gases. The chemical reaction time to complete the growth of an individual atom layer is approximately 25 x 10(exp -6) second.

METHOD FOR DOPING GaAs WITH HIGH VAPOR PRESSURE ELEMENTS Patent
Bijan Tadayon, inventor (to Navy) and Saied Tadayon, inventor (to Navy) 2 Feb. 1993 7 p Filed 3 May 1991
(AD-D015794; US-Patent-5,183,779; US-Patent-Appl-SN-695018;
US-Patent-Class-437-165) Avail: US Patent and Trademark Office

A method is disclosed for the incorporation of relatively high vapor pressure elements into good quality GaAs at extremely low T(sub s) using the migration enhanced epitaxy technique. Zinc was doped in GaAs material grown at a low T, of 120 C. Zinc may thus be used as a p-type dopant replacing more toxic Be. Similarly, other high vapor pressure elements can be incorporated much more efficiently into the material grown at low T(sub s).

(Contract DAAL03-89-G-0110)
(AD-A266570; ARO-27154-8-PH-SAH) Avail: CASI HC A01/MF A01

A systematic investigation of ultrafast electron tunneling processes in semiconductor microstructures in presence of inter-valley (X-gamma) scattering, infrared radiation, phonons, and Coulomb interaction has been undertaken. Various important time constants involved in high speed electronic and photonic device operation were obtained such as the lifetime of a quasi-bound state, the time needed for an electron to tunnel into a well through a barrier, and the escape time for an electron to tunnel out from a well through a barrier. Our investigation under the period supported by the grant has resulted in ten journal publications.

POWDER DIFFRACTION STUDIES USING ANOMALOUS DISPERSION
D. E. Cox and A. P. Wilkinson (California Univ., Santa Barbara.) 1993 25 p Presented at the International Conference on Anomalous Scattering, Malente, Germany, 15-19 Aug. 1993
(Contract DE-AC02-76CH-00016)
(DE93-012531; BNL-48626; CONF-930899-1) Avail: CASI HC A03/MF A01

With the increasing availability and accessibility of high resolution powder diffractometers at many synchrotron radiation sources throughout the world, there is rapidly-growing interest in the exploitation of anomalous dispersion techniques for structural studies of polycrystalline materials. In conjunction with the Rietveld profile method for structure refinement, such studies are especially useful for the determination of the site distributions of two or more atoms which are near neighbors in the periodic table, or atoms which are distributed among partially occupied sites. Additionally, it is possible to (1) determine the mean-square displacements associated with different kinds of atoms distributed over a single set of sites, (2) distinguish between different oxidation states and coordination geometries of a particular atom in a compound, and (3) to determine f' for a wide range of atomic species as a function of energy in the vicinity of an absorption edge. Experimental methods for making anomalous dispersion measurements are described in some detail, including data collection strategies, data analysis and correlation problems, possible systematic errors, and the accuracy of the results. Recent work in the field is reviewed, including cation site-distribution studies

(e.g. doped high (Tc) superconductors, ternary alloys, FeCo2(PO4)3, FeNi2BO5), oxidation-state contrast (e.g. YBa2Cu3O(6+x), Eu3O4, GaCl2, Fe2PO5), and the effect of coordination geometry (e.g. Y3Ga5O12). DOE

(Contract N00014-91-J-1035)
(AD-A266492; TR-15) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Dioxorhenium(V) tetrapyridyl species are currently under active investigation as model systems for interfacial two-electron, two-proton transfer reaction sequences. We now find that the corresponding oxo,methoxo complexes can be prepared from dioxo species and methyl trifluoromethanesulfonate. The new complexes behave nearly identically to the analogous oxo,hydroxo complexes - with one important exception: CH3(+), unlike H(+), does not dissociate from the oxo ligand. As a direct consequence, the usually elusive rhenium oxidation state, IV, is stabilized with respect to redox disproportionation and is observable for several complexes at high pH. The ability to detect this state, in turn leads to: (1) direct access to the formal reduction potentials for the isolated 1e(-) redox couples comprising the overall two electron transfer (key information for understanding multi-ET kinetics); (2) elucidation of the profound structural and energetic consequences of the initial protonation (methylation) step in the dioxorhenium(V) reduction kinetics; (3) estimates for pK(sub s) of (O)(HO)Re(sup IV)L4(3+) (exceptionally negative); and (4) estimates for the first pK(sub s) of (HO)2Re(III)L4(+) (extremely large and positive). The combination of (1) and (2), in principle, provides sufficient information to characterize completely the energetic accessiblity of key intermediate species lying just before or just after the transition state for the two-electron, two-proton reduction of dioxorhenium(V) at electrochemical interfaces.

(Contract N00014-91-J-1636)
(AD-A266568) Avail: CASI HC A01/MF A01

In this dissertation, the precision of molecular-beam epitaxy (MBE) is taken advantage of in order to grow semiconductor reflectors, microcavities, and quantum wells for studies of vertical-cavity surface-emitting lasers (VCSEL's) and the coupling between reflectors and the spatially localized dipoles of semiconductor quantum wells. The design of the structures and the choice of epitaxial growth parameters used for the structures are discussed in detail. Experimental techniques and results are discussed which relate to studies that advance the optoelectronics technology and our understanding of fundamental physics. MBE is used to grow epitaxial structures in which a QW is precisely placed either in close proximity to a DBR, or near the surface of the epitaxial layer, so that a highly reflective mirror can be placed in close proximity to the QW. TRITIUM DIFFUSION AND DESORPTION IN SINGLE CRYSTAL LIAIO2
J. P. Kopasz, C. A. Seils, and C. E. Johnson 1992 11 p Presented at the International Workshop on Ceramic Breeder Blanket Interactions, Tokyo, Japan, 26-29 Oct. 1992
(Contract W-31-109-eng-38)
(DE93-015140; ANL/CMT/CP-79667; CONF-9210255-2) Avail: CASI HC A03/MF A01

In an attempt to determine the diffusivity of tritium in lithium aluminate, we have performed isothermal annealing tests on single crystal samples (approximately 1.5 mm dia.). Large single crystals were used to minimize the contributions from desorption. Diffusion kinetics become more dominant as the crystal radius increases due to the decreasing surface area to volume ratio. However, the release may still be in the mixed diffusion-desorption regime which would make obtaining the rate constants from the time dependence of the tritium release difficult. Therefore, we have decided to section the samples and determine the diffusivity from the tritium concentration profile within the sample. In addition, in an attempt to understand the effects of impurities on the tritium transport, we have studied the tritium profiles in pure and Mg doped (0.3%) LiAlO2. DOE

MICROSTRUCTURE OF Zr3Al AFTER 2 MeV PROTON BOMBARDMENT
F. C. Chen (University of Southern California, Los Angeles.), A. J. Ardell (University of Southern California, Los Angeles.), D. F. Pedraza, and R. A. Buhl 1992 6 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-015331; CONF-921101-127) Avail: CASI HC A02/MF A01

The ordered intermetallic Ll2 alloy Zr3Al was irradiated with 2 MeV protons at -124 C to fluences up to 2(10)(exp 15) H(+)/sq mm and at 250 C to fluences 1(10)(exp 15) H(+)/sq mm. Defects with spherically symmetric strain fields were produced at both irradiation temperatures. They are of interstitial character at -124 C and vacancy character at 250 C. Disordering is induced at -124 C, whereas irradiating at 250 C initially lowers, then slightly raises, the degree of long-range order above its unirradiated value. Additional defects that appear as black spots were imaged using superlattice reflections in dark field. For the low-temperature irradiations they were seen at all doses, but were present at only the lowest dose for the high-temperature irradiations. They are probably disordered zones, although some of the zones may be amorphous at the higher doses in the low-temperature irradiations. DOE

CRYSTALLINE BEAM GROUND STATE
Jie Wei, Xiao-Ping Li (California Univ., Berkeley. Lawrence Berkeley Lab.), and A. M. Sessler (California Univ., Berkeley. Lawrence Berkeley Lab.) 1993 4 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contracts DE-AC02-76CH-00016; DE-AC03-76SF-00098)
(DE93-014331; BNL-48385; CONF-930511-63) Avail: CASI HC A01/MF A01

In order to employ Molecular Dynamics method, commonly used in condensed matter physics, we have derived the equations of motion for a beam of charged particles in the rotating rest frame of the reference particle. We include in the formalism that the particles are confined by the guiding and focusing magnetic fields, and that they are confined in a conducting vacuum pipe while interacting with each other via a Coulomb force. Numerical simulation has been performed to obtain the equilibrium structure. The effects of the shearing force, centrifugal force, and azimuthal variation of the focusing strength are investigated. It is found that a constant gradient storage ring can not give a crystalline beam, but that an alternating-gradient (AG) structure can. In such a machine the ground state is, except for one-dimensional (1-D) crystals, time-dependent. The ground state is a zero entropy state, despite the time-dependent, periodic variation of the focusing force. The nature of the ground state, similar to that found by Rahman and Schiffer, depends upon the density and the relative focusing strengths in the transverse directions. At low density, the crystal is 1-D. As the density increases, it transforms into various kinds of 2-D and 3-D crystals. If the energy of the beam is higher than the transition energy of the machine, the crystalline structure can not be formed for lack of radial focusing. DOE

DENSITY OF STATES AND TUNNELING CHARACTERISTICS OF LAYERED SUPERCONDUCTORS
S. H. Liu and R. A. Klemm (Argonne National Lab., Idaho Falls, ID.) Apr. 1993 3 p Presented at the Conference of the International Union of Pure and Applied Physics on Low Temperature Physics (LT 20), Eugene, OR, 1-11 Aug. 1993
(Contracts DE-AC05-84OR-21400; W-31-109-eng-38)
(DE93-015898; CONF-930801-5) Avail: CASI HC A01/MF A01

We have studied the structure of the density of states (DOS) curves and tunneling characteristics of layered superconductors with two distinct layers in a unit cell. In general, the peaks of the DOS curves do not correspond to energy gaps of each layer, but depend on the gaps and the interlayer hopping strengths in a complex manner. This makes the

interpretation of tunneling data of layered superconductors much less straightforward than isotropic superconductors. Our simulated tunneling characteristics bear certain resemblance to experimental results. DOE

INSIGHTS INTO SEMICONDUCTING MATERIALS AND GROWTH PHENOMENA THROUGH Z-CONTRAST STEM
S. J. Pennycook, D. E. Jesson, M. F. Chisholm, and N. D. Browning Apr. 1993 5 p Presented at the 20th Annual Meeting of the Microscopical Society of Canada, Toronto (Canada), 2-5 Jun. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015964; CONF-9306183-1) Avail: CASI HC A01/MF A01

The high-angle annular detector proposed by Howie is used to form an atomic resolution Z-contrast image in a high-resolution scanning transmission electron microscope. For incoherent scattering, the coherent probe is effectively channeled along each individual atomic column, forming a basis for atomic resolution incoherent imaging and atomic resolution microanalysis. Incoherent imaging is combined with strong compositional sensitivity. Since a model structure is not needed to interpret the images to first order, unexpected interfacial phenomena are immediately apparent, such as the compositional ordering at a CoSi2/Si(100) interface made by high-dose Co implantation and annealing. Growth and relaxation of strained Si(x)Ge(1-x) layers are studied. Combining atomic resolution imaging and analysis on a single microscope is a powerful method for studying interfaces without any prior knowledge or model structures. DOE

DIFFUSE SCATTERING AND IMAGE CONTRAST OF TWEED IN SUPERCONDUCTING OXIDES: A SIMULATION AND INTERPRETATION
Yimei Zhu and Zhi-Xiong Cai 1993 23 p Presented at the John M. Crowley Symposium on Ultramicroscopy, Scottsdale, AZ, 5-8 Jan. 1993
(Contract DE-AC02-76CH-00016)
(DE93-016131; BNL-48498; CONF-9301114-1) Avail: CASI HC A03/MF A01

Monte Carlo simulations were performed with a lattice gas model which represents the interactions between oxygen atoms in YBa2 (Cu(1-x)M(x))(sub 3) O(7+delta) (M=Fe, Co, or Al, 0.03 less than x less than 0.1) system. The amplitudes of concentration waves/displacement waves obtained from these simulations were then used to calculate the intensity of the diffuse scattering of tweed seen in the electron diffraction pattern. The characteristic features of the tweed image were produced by calculation, using a model based on the contrast originating from structures with displacive modulation, stacking on the top of each other. Both calculations agree well with the TEM observations and provide a useful basis for a better insight into the origin of the tweed structure. DOE

STRUCTURAL PHASE TRANSITION AND SUPERCONDUCTIVITY IN La(2-x)Ba(x)CuO4
S. Katano (Japan Atomic Energy Research Inst., Tokai.), S. Funahashi (Japan Atomic Energy Research Inst., Tokai.), J. A. Fernandez-Baca, N. Mori (Tokyo Univ., Japan.), C. Murayama (Tokyo Univ., Japan.), and Y. Ueda (Tokyo Univ., Japan.) 1993 7 p Presented at the International Symposium on Advanced Nuclear Energy Research: Neutrons As Microscopic Probes, Mito Ibaraki (Japan), 10-12 Mar. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015812; CONF-9303190-1) Avail: CASI HC A02/MF A01

High-resolution neutron powder diffraction experiments and ac magnetic susceptibility measurements have been performed on La(2-x)Ba(x)CuO(4) (where x = 0.125) at ambient pressure and under high pressures. Crystal parameters including bond lengths and angle are refined by profile analysis at ambient pressure. Results suggest that the changes in the Cu-O bonds accompanied with the structural phase transition may be related to the suppression of the superconductivity. Effects of pressure on the structural transition is fairly large. The LTT phase is greatly suppressed and disappears at 0.7 GPa. The superconducting transition temperature (Tc) remains almost constant up to 0.5 GPa; however, above this pressure it increases at the rate of about 10 K/GPa. These results clearly indicate a strong correlation between the crystal structure and the superconductivity in this system. DOE

SUPPRESSION OF CHARGE SCATTERING IN MOESSBAUER EXPERIMENTS USING SYNCHROTRON RADIATION
U. Bergmann, D. P. Siddons, and J. B. Hastings 1992 17 p Presented at the International Conference on Anomalous Scattering (ICAS), Hamburg, Germany, 17-21 Aug. 1992
(Contract DE-AC02-76CH-00016)
(DE93-015406; BNL-48963; CONF-9208186-4) Avail: CASI HC A03/MF A01

The extremely small ratio of linewidth to energy combined with the character of recoil free absorption and reemission makes the low lying nuclear resonances a unique spectroscopic tool. Further, considering the simplicity of performing Moessbauer experiments, they have become very useful in a wide range of disciplines. (sup 57)Fe has remained the most widely used isotope despite its low natural abundance (2%) because iron is ubiquitous in nature and shows a strong effect. The energy width of this resonance corresponds to a lifetime of 140 nsec of the excited state. Therefore in principle time differential spectroscopy is possible. Using the time differential measurement one is no longer restricted to a nuclear source, in fact a short pulse excitation is favored in such experiments. The concept of using a pulsed source and time gating to isolate the resonant scattering was already suggested in 1962. In 1974 it was noted that synchrotron radiation (SR) was ideally suited to this task. Although the time gating technique is conceptually simple the bandwidth of SR poses significant technical difficulties. In this paper we will discuss the extraction of the nuclear signal from the overwhelming background, which is the central problem in SR-based Moessbauer experiments. We will only, consider the (sup 57)Fe-isotope, although other isotopes might be of interest in a SR-based experiment. Although SR sources have the disadvantages of creating this high background and being limited in beam-time and location, new and unique opportunities make them very attractive even with these difficulties. For this reason research and development groups at every major SR facility worldwide are increasingly working on Moessbauer experiments, stimulated by the first successful observation of nuclear Bragg scattering (NBS) using SR in 1984. GROWTH AND DOPING OF Al(x)Ga(1-x)N FILMS BY ELECTRON CYCLOTRON RESONANCE ASSISTED MOLECULAR BEAM EPITAXY Annual Report, May 1992 - 30 Apr. 1993
Theodore D. Moustakas 30 May 1993 104 p
(Contract N00014-92-J-1436)
(AD-A267305) Avail: CASI HC A06/MF A02

During this funding period, the work focused on the heteroepitaxial growth, doping, and characterization of GaN by the ECR-MBE method.

Nitrogen-ECR plasmas were investigated by Optical Emission Spectroscopy. Work was also initiated in the growth of AlN. In the area of GaN growth on (0001) sapphire, we identified ECR-plasma conditions to grow the material in the layer-by-layer growth mode to a layer-by-layer growth followed by an island growth mode. Such films were grown in semi-insulating form (p approximately equal to 10(exp 12) omega-cm) and doped p- and n-type with Mg and Si at the level of 10(exp 19) cm(exp -3) RIE of GaN using CCl2F2 and CF3Br/Ar as well as Ohmic contacts to n-GaN were developed. Defects in the films were characterized by photoluminescence and EPR studies. Initial studies of AlN growth indicate that the material can grow in the single crystal form at temperatures comparable to that of GaN. DTIC

AN ALTERNATIVE APPROACH TO THE GROWTH OF SINGLE CRYSTAL GALLIUM NITRIDE Final Report, 1 Sep. 1990 - 31 Jan. 1993
Neville Jonathan 30 Jun. 1993 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0337-90)
(AD-A267876; AFGAN-2; EOARD-TR-93-08) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This project has been primarily concerned with investigating a new approach to the synthesis of epitaxial layers of high purity gallium nitride. The new approach involves the use of hydrazoic acid, HN3, a previously untried precursor as the source of active nitrogen. A new, all-stainless steel apparatus which is UHV compatible, has been constructed. It has been designed to allow growth studies to be made by the chemical beam epitaxy (CBE) technique or by low pressure metal organic vapour phase deposition (LPMOCVD) at pressures up to ca. 1 mbar. During the grant period, the apparatus has been constructed, tested, and modified. Experiments have been carried out which show that gallium nitride and aluminium nitride can be made from the reaction of hydrazoic acid with trimethyl gallium and trimethyl aluminium respectively, at a hot substrate surface. In-situ RHEED patterns and ex-situ Auger spectra and x-ray diffraction data have been obtained. Systematic studies aimed at producing high quality single crystal films have been made. The results are promising and uniform, golden yellow films of gallium nitride can now be produced. RHEED data show that the films are composed of highly orientated crystals. The x-ray results support this, with crystal sizes being at least 1000 A with the crystals strongly orientated along the c-axis. DTIC

PHOTO-ASSISTED EPITAXIAL GROWTH FOR III-V SEMICONDUCTORS Interim Report, 1 Sep. 1990 - 31 Oct. 1992
C. W. Tu Feb. 1993 58 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-90-C-5946)
(AD-A267889; UCSD-CWT-93-R1; WL-TR-93-4029) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Photo-assisted metalorganic molecular beam epitaxy (MOMBE), with an argon ion laser, has been used to grow GaAs. The substrate temperature was calibrated by an infrared laser interferometric technique with an accuracy of + or - 3 C. The MOMBE growth of GaAs, InAs, and InGaAs was first studied, by monitoring intensity oscillations of reflection high-energy electron diffraction (RHEED). The actual arsenic incorporation rate was deduced from As-induced RHEED oscillations, and a unity V/III incorporation ratio could be obtained. In growing InGaAs, indium segregation suppresses the InGaAs growth rate. In laser-assisted MOMBE, the enhancement of arsenic desorption with laser irradiation and its effects were observed. The decomposition of triethylgallium and desorption of arsenic compete with each other, resulting in a saturation in the enhanced growth rate in the arsenic-controlled growth regime. The initial growth behavior was also studied by inspecting the details of the RHEED behavior and arsenic surface coverage. DTIC

THE INFLUENCE OF AN ELECTRIC FIELD ON THE KINETICS OF NUCLEATION [WPLYW POLA ELEKTRYCZNEGO NA KINETYKE NUKLEACJI]
Leszek Jarecki 1991 62 p In POLISH
(IFTR-2/91) Avail: CASI HC A04/MF A01

This paper examines in detail a crystallization model in an electric field that has been proposed previously for systems in oriented fields. The model takes into account the angular configuration of the crystal nuclei and the effect of rotational diffusion of the nuclei on nucleation kinetics. The orientation state of the amorphous phase in an electrostatic field, where the particles manifest uniaxial symmetry under polarization and are subject to a constant dipole moment are analyzed. An expression is given for the free formation energy of the polar and non-polar aggregates of the crystallized stated depending on the angle within the field assuming uniaxial symmetry of the polarization tensor of the crystal grid. A solution of a continuity equation expanded in terms of the magnitude and orientation of the aggregates is given; this solution takes into account the growth and rotational diffusion of the aggregates where the motive force behind such processes consists of the free growth energy and the free energy of the aggregates in the field. The solution takes a form that accounts for the kinetic parameter representing the ratio of the continuous rotation diffusion of the nucleus and the reaction constant of the aggregate with a single element. An expression is derived for the angular distribution of the nucleation rate in the form of an expansion in an established parameter; an expression for independent diffusion is derived together with expressions corresponding to rotational diffusion and nucleation in a system disrupted by diffusion. Certain values of the angular distributions of the nucleation rate and diffusion corrections as a function of field intensity and temperature for polar and non-polar phases of polyfluorovinylide are discussed. Solid solutions and pseudomorphic heterostructures of AlN and SiC have been grown on vicinal alpha (6H)-SiC substrates via plasma-assisted, gas-source molecular beam epitaxy at 1050 C. Reflection high energy electron diffraction, high resolution TEM, and Auger depth profiling show the films to be monocrystalline and to possess the desired chemical compositions. The solid solutions have the wurtzite structure. The multilayers have the following phases: alpha (6H)-SiC substrate, 2H-AlN, and 3C-SiC. Chemical interdiffusion between alpha (6H)-SiC wafers and epitaxially deposited 2H-AlN films are under investigation within the temperature range of 1500 C to 1700 C. Scanning Auger spectroscopy and XTEM is being used to determine the diffusion profiles and the occurrence of new phases. The Auger data and electron energy loss measurements are in disagreement. Additional diffusion and segregation research is under way to resolve this conflict. Superlattices of GaN/AlN on sapphire and SiC have been extensively investigated via HRTEM. Below the critical thickness, AlN only contains threading dislocations emanating from the misfit dislocations; above this thickness, defects parallel to the growth surface greatly increase. Deposition of GaN on sapphire or SiC results in a larger number of threading dislocations caused by the large misfit as well as a high concentration of dislocations parallel to the growth surface. Both types of defects are decreased in density if the GaN is deposited on AlN. DTIC

The maximum temperature at which self-terminating monolayers of Si can be formed on Si(100) from Si2H6 has been determined to be 570 deg C. As such, the chemical reactivity of C2H4 has been determined to be insufficient at this temperature, and acetylene has been selected as the successor C precursor due to its superior reactivity and chemisorption

properties. A cryogenic purifier for removing acetone has been commissioned. Trenched Si(100) wafers are also being made to assess the ALE process for sidewall deposition uniformity and future bipolar devices. Nonstoichiometric, Si-rich SiC has been produced with an associated decrease in the band gap. An AES/XPS UHV analytical system and associated ALE deposition system has been commissioned and integrated into a much larger surface science system. These dual systems will allow a thorough study and characterization of both the initial nucleation of SiC and the overall ALE growth process of SiC. Tetramethylsilane and hexamethyldisilane have been deposited onto Si substrates in a hot filament CVD chamber to investigate their ability to promote ALE of diamond under DC biasing and a variety of system parameters. An electron gun and heating stage has been added to the growth chamber to enable AES and substrate heating. Good quality diamond films have been nucleated on deposited interlayers of both precursor compounds. The films have been examined by SEM and Raman spectroscopy. Good quality epitaxial films of CeO2 have been grown on Si(111) using laser ablation. Atomically clean substrates and slow growth rates were determined necessary for epitaxy. DTIC

One possibility for accomplishing growth of single crystal diamond film on a nondiamond substrate is based upon ion implantation of carbon atoms into crystalline copper. In spite of widespread interest in the concept, heteroepitaxial diamond growth by this approach has never been confirmed. The objective of this program is to develop specialized ion implantation capabilities for C(+) into Cu processing under conditions for which heteroepitaxial formation of diamond on copper may be feasible. A 200 keV medium current ion implantation system has been modified to allow implantations to be performed into substrates at temperatures up to 1000 C, to incorporate background atomic hydrogen in the vicinity of the substrate surface during implantation, and to facilitate in-situ CVD diamond growth processing. Apparatus development has been completed, and process investigations have been initiated. DTIC

(Contract N00014-91-J-1441)
(AD-A267291) Avail: CASI HC A02/MF A01

Progress this period was accomplished in two areas: hot electron degradation studies of partially- and fully-depleted transistors; and measurement and analysis of relaxation parameters (generation lifetime) in fully-depleted enhancement and accumulation mode transistors. A summary of the results is given in the attached abstracts: Successive Charging/Discharging of Gate Oxides in SOI MOSFET's by Sequential Hot Electron Stressing of Front/Back Channel and Generation Lifetime Measurements in Fully Depleted Enhancement and Accumulation Mode SOI MOSFET's submitted for presentation in the forthcoming 1993 IEEE SOI Conference; and Sequential Stressing of Front/Back Gate Oxides in SOI MOSFET's for Device Characterization and Applications submitted for presentation in the forthcoming 1993 IEEE IEDM. A presentation was given at INFOS' 93 (8th biennial conference on Insulating Films on Semiconductors) on the topic of Mechanisms of Hot-Carrier Induced Degradation of SOI (SIMOX) MOSFET's. A full length paper on the mechanisms of our hot carrier degradation studies is under preparation for IEEE Transactions on Electron Devices. DTIC

INVESTIGATION OF THE ORIGIN OF HOT SPOTS IN DEFORMED CRYSTALS: AMMONIUM PERCHLORATE STUDIES Final Report, Jan. 1986 - Sep. 1990
W. L. Elban, H. W. Sandusky, B. C. Beard, and B. C. Glancy 19 Jul. 1993 40 p
(AD-A267692; NSWCDD/TR-92/206) Avail: CASI HC A03/MF A01

A number of single crystals of ammonium perchlorate (AP) were shock loaded near the reaction threshold to investigate the effects of concentrated lattice defects (dislocations) and differing crystal orientations on chemical reactivity. Large, optical quality crystals of pure AP were immersed in mineral oil and shocked through either the (001) or 210 surfaces by a detonator. Prior to shock loading, some crystals had localized regions of increased lattice defects and strain created by placing diamond pyramid (Vickers) hardness impressions into their exterior cleavage surfaces. High-speed photographs showed preferential cracking and luminosity near some of the hardness impressions. The photographs also revealed the occurrence of the same slip deformation identified previously from hardness testing. The shocked crystals were recovered, sometimes intact, for microstructural characterization and chemical analyses. Crystal orientation relative to the shock propagation direction changed the dynamic response and threshold for decomposition of the crystal, indicating the influence of material microstructure. Along these freshly cleaved surfaces, the XPS results showed enhanced lattice disruption and perchlorate decomposition as a result of the hardness impressions. The greatest decomposition was not immediately adjacent to the impressions, but near the tips of cracks and along slip planes emanating from the impressions several millimeters, or more, into the crystal. DEVELOPMENT OF ULTRA-LOW NOISE, HIGH PERFORMANCE 3-V QUANTUM WELL INFRARED PHOTODECTORS (QWIP'S) FOR FOCAL PLANE ARRAY STARING IMAGE SENSOR SYSTEMS Quarterly Progress Report No. 8, 1 May - 31 Jul. 1993
Sheng S. Li 1 Aug. 1993 64 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1976)
(AD-A267715) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

During this reporting period we have continued to make excellent progress towards the program goals. We have made a major breakthrough in the development of a new normal incidence p-type strained layer InGaAs/InAlAs QWIP grown on InP by MBE, which achieved both the lowest dark current and highest detectivity ever reported for a QWIP operating at 8.1 um and 77 K. The device dark current at 77 K is one to two orders of magnitude smaller than its 300 K background photocurrent, which shows that this p-type strained layer QWIP is under BLIP operation at 77 K. Other tasks performed during this period include: (1) measured and compared the device dark current with 300 K background limited photocurrent (BLIP) for several QWIP's fabricated from GaAs/AlGaAs, InGaAs/InAlAs, and AlAs/AlGaAs material systems, (2) designed a broad band 2-D square mesh grating coupler for the dual-mode operation GaAs QWIP to enhance the coupling quantum efficiency and responsivity of this QWIP in the 3-5 and 8-12 um bands, (3) using a 2-D square mesh grating coupler to achieve maximum responsivity for an InGaAs SBTM QWIP, and (4) performed noise characterization on four different types of III-V QWIP's and identified their noise sources. Detailed results and accomplishments are discussed in this report. DTIC

THEORETICAL STUDIES OF THE CRYSTAL STRUCTURE OF RARE EARTHS AND ACTINIDES AT ZERO TEMPERATURE
J. M. Wills and O. Eriksson (Uppsala Univ., Sweden.) 1993 9 p Presented at the 14th International Conference on High Pressure Science and Technology and the 1993 Meeting of the Topical Group on Shock Compression of Condensed Matter, Colorado Springs, CO, 28 Jun - 3 Jul. 1993
(Contract W-7405-eng-36)
(DE93-016488; LA-UR-93-2368; CONF-9306167-7) Avail: CASI HC A02/MF A01

Accurate total energy electronic structure calculations have recently been carried out over a range of volumes for selected rare-earth and actinide elements in crystal structures experimentally observed in these elements. Correct zero temperature crystal structures are obtained, and calculated equilibrium properties are in reasonable agreement with experiment. Results of these calculations indicate that the interactions underlying crystal structure stability are similar in itinerant f-electron metals and transition metals. The stable crystal structure at a particular volume is determined by a balance between one-electron bandwidths and band fillings

and the electrostatic energy of the crystal lattice. Broad bands favor high-symmetry, close-packed structures while narrow bands favor low-symmetry, open structures; allowing for expansion as well as contraction, both transition and actinide elements can be stabilized in both low- and high-symmetry crystal structures. Space is an Application Visualization System (AVS) graphics module designed for crystallographic and molecular research. The program can handle molecules, two-dimensional periodic systems, and three-dimensional periodic systems. All are referred to in the paper as models. Using several methods, the user can select atoms, groups of atoms, or entire molecules. Selections can be moved, copied, deleted, and merged. An important feature of Space is the crystallography component. The program allows the user to generate the unit cell from the asymmetric unit, manipulate the unit cell, and replicate it in three dimensions. Space includes the Buerger reduction algorithm which determines the asymmetric unit and the space group of highest symmetry of an input unit cell. Space also allows the user to display planes in the lattice based on Miller indices and to cleave the crystal to expose the surface. The user can display important precalculated volumetric data in Space, such as electron densities and electrostatic surfaces. With a variety of methods, Space can compute the electrostatic potential of any chemical system based on input point charges. DOE

BURIED POROUS SILICON-GERMANIUM LAYERS IN MONOCRYSTALLINE SILICON LATTICES AND METHOD OF PRODUCING Patent Application
Robert W. Fathauer, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) and Thomas George, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) 11 Aug. 1993 23 p
(Contract NAS7-918)
(NASA-Case-NPO-18836-1-CU; NAS 1.71:NPO-18836-1-CU; US-Patent-Appl-SN-105728) Avail: CASI HC A03/MF A01

Lattices of alternating layers of monocrystalline silicon and porous silicon-germanium have been produced. These single crystal lattices have been fabricated by epitaxial growth of Si and Si-Ge layers followed by patterning into mesa structures. The mesa structures are stain etched resulting in porosification of the Si-Ge layers with a minor amount of porosification of the monocrystalline Si layers. Thicker Si-Ge layers produced in a similar manner emitted visible light at room temperature. NASA

(Contract N00014-92-J-1477)
(AD-A268269) Avail: CASI HC A06

Theoretical studies have involved calculations of the electronic states of hydrogenated surfaces and the properties of defect and impurities in GaN. Infrared studies on diamond films have indicated SiC at the interface and the lack of C-H bonding in the films. To investigate SiC growth, two chambers have been integrated into the surface science facility. Studies of the interdiffusion of SiC-AlN have indicated new results concerning SiC-AlN phase diagrams. The use of ALE for SiC deposited on patterned substrates has been initiated. Low temperature (LT) GaP and InGaP films produced by gas source MBE proved the first demonstration of high resistivity, semi-insulating properties. Using an ALE reactor, layer-by-layer growth of GaN has been demonstrated. The CVD deposition of AlN nitride has been demonstrated on various substrates. A combined photo/cathodo-luminescence system is being assembled. The effects of hydrogen and oxygen on the Schottky barrier of Ni/diamond has been studied, and negative electron affinity effects are observed. The Schottky barrier properties of various metals on clean n-type 6H-SiC have been measured. Approaches have been developed for contacts on GaN and AlN. A reactive ion etching system has been configured for patterning of GaN and AlN films. DTIC

LASER PROBING OF THE KINETICS AND DYNAMICS OF 3-5 SEMICONDUCTOR GROWTH Final Report, Feb. 1990 - 30 Jun. 1993
Stephen R. Leone 30 Jun. 1993 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0166-90)
(AD-A268388; AFOSR-93-0583TR) Avail: CASI HC A03

Work is carried out on the dynamics of Ga, In, and As scattering, sticking, and desorption from silicon single crystals using laser induced fluorescence and laser ionization probing of the Ga and In atoms and As atoms, dimers, and tetramers in the gas phase. Desorption kinetics are used to probe the InAs and GaAs heterostructures on silicon and the islanding behavior that occurs for the mixed systems. It is observed that islands form readily when In and Ga are grown on a prelayer of As on Si(100). State-resolved detection of As2 species is demonstrated by laser-induced fluorescence probing for the first time. Laser single photon ionization detection of III-V semiconductor species is also demonstrated with high sensitivity and species specific detection. These results are relevant to the epitaxial growth of GaAs and InAs on silicon. DTIC

LATTICE RELAXATION THEORY OF LOCALIZED EXCITATIONS IN QUASI-ONE-DIMENSIONAL SYSTEMS
Chui-Lin Wang (China Center for Advanced Science and Technology, Beijing.), Zhao-Bin Su, and Yu Lu Apr. 1993 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-624947; IC-93/71) Avail: CASI HC A03 (US Sales Only)

The lattice relaxation theory developed earlier by Su and Yu for solitons and polarons in conducting polymers is applied to systems with both electron-phonon and electron-electron interactions, described by a single band Peierls-Hubbard model. The localized excitations in the competing bond-order-wave (BOW), charge-density-wave (CDW) and spin-density-wave (SDW) systems show interesting new features in their dynamics. In particular, a non-monotonic dependence of the relaxation rate on the coupling strength is predicted from the theory. The possible connection of this effect with photo-luminescence experiments is discussed. Similar phenomena may occur in other quasi-one-dimensional systems as well. DOE

(AD-A268144; AFOSR-93-0585TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Compound semiconductors are attractive materials for optoelectronic devices since they present a broad selection of band gaps. The mechanical properties of these materials is of interest for both practical and theoretical reasons; however, there is a paucity of experimental information on this topic. The objective of this research program was to develop methods for providing reliable experimental information on the mechanical properties of compound semiconductors and their alloys. The main activity has been the measurement of the hardness of these materials. We have used two basic hardness measurements: conventional microhardness measurements, such as the Vickers hardness test; and the Nanoindentor hardness. For the former measurements, bulk crystals or thick films were needed. A significant part of the program was devoted to preparing relevant samples for these measurements. We used conventional methods of crystal growth for producing bulk crystals, and we developed novel methods of vapor phase epitaxial growth to prepare thick films of variable composition. The Nanoindentor was used for measuring the hardness and the modulus of thin films, and bulk samples were measured by Vickers or with the Nanoindentor. We investigated a wide variety of semiconductor systems for measurement, but we selected a few systems that had well established device applications for particular emphasis in our studies. DTIC

INVESTIGATIONS OF YBaCuO MATERIALS WITH NEAR-ROOM-TEMPERATURE RESISTIVITY TRANSITIONS Annual Report, 15 Jun. 1993 - 14 Jun. 1993
Lowell E. Wenger and J. T. Chen 14 Jul. 1993 6 p
(Grant AF-AFOSR-0319-91)
(AD-A268016; AFOSR-93-0587TR) Avail: CASI HC A02/MF A01

This annual technical report describes the continual superconductivity research on the materials and structural phases responsible for the above 200-K superconducting transitions, their synthesis conditions, and the study of the physical properties associated with these transitions. Superconducting resistive transition and magnetic flux trapping phenomena have been observed in mixed-phase ceramic samples of YBaCuO e.g. Y5Ba6Cu11O(x) and on the surfaces of YBa2Cu3O7 single crystals in the temperature range 230 K to 270 K. Near room-temperature oxidation studies show that the properties can change, including a large resistance decrease over a 3-month period. This behavior is consistent with the formation of a different oxide phase on the surface of the grains. Structural analyses by x-ray diffraction and high-resolution transmission electron microscopy indicate these samples have surfaces with large amounts of defect structures as well. Correspondingly these surface phases/structures may be responsible for the above 200-K transitions. DTIC

(AD-A268206) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

A series of computer-based statistical experimental designs have been conducted to determine the optimum conditions for negative bias-enhanced nucleation of diamond. The concentration of CH4 and the effects of pressure and bias voltage on the time for complete coverage of the substrate, film uniformity, and nucleation density were the experimental parameters and desired results investigated. Time to complete film formation, uniformity, and nucleation density were all improved with the use of both a negative bias voltage and high CH4 concentrations. Diamond has also been formed on diamond seeds placed on nickel substrates via microwave plasma CVD. The long range nucleation density was low and the formation of clusters of diamond more common. Polycrystalline Si-Ge films have been grown by e(-) beam deposition on naturally occurring p-type semiconducting diamond C(001) substrates. Room temperature and 300 C I-V data show the formation of a low-barrier rectifying contacts which exhibit ohmic behavior. Annealing at 850 C under UHV conditions resulted in apparent degradation in the I-V characteristics. DTIC

(Contract F49620-92-C-0004)
(AD-A268199; AFOSR-93-0593TR) Avail: CASI HC A02

Progress under AFOSR Contract F49620-92-C-0004 for the period 15 Oct. 1991 to 31 Oct. 1992 is reported. Important results include studies of the grain boundaries in a-axis oriented high-Tc superconducting 123 YBCO thin films, the study of the vortex properties of high-Tc single crystals of the superconductor 2212 BSCCO, and the artificially structured Mo-Ge/Ge quasi-two-dimensional superconductors. The latter provide an outstanding model system for the study of vortices in highly anisotropic superconductors, such at the high-Tc cuprates, without all the attendant difficult materials problems. Progress in the synthesis and study of the so-called infinite layer cuprate SrCuO4 and the normally conducting oxide SrRuO3 of interest as a barrier materials in high-Tc SNS devices are also reported. Finally, we report the development of advanced approaches to rate control of the cation fluxes in the reactive coevaporation of the high-Tc superconductors. DTIC

The overall goal of this Phase 1 project was to focus on developing procedures for the fabrication and evaluation of epitaxial layers of GaAs which are doped with rare earth (RE) ions of Erbium. The essential elements of the originally proposed approach have been demonstrated through the efforts on this Phase 1 project. Erbium was successfully incorporated in epitaxially grown Gallium Arsenide (GaAs) and Aluminum-Gallium Arsenide (AlGaAs) by using the Metal Organic Chemical Vapor Deposition (MOCVD) method and using Tris(n-butylcyclopentadienyl)erbium Er(C4H9C5H4)3 as Er source material. Concentrations of Erbium as high as 10(exp 19)/cm(exp

-3) were detected by Secondary Ion Mass Spectroscopy (SIMS). A substantial, though unknown, amount of the Erbium was incorporated in the form of trivalent ions; this was evident by the observation of the characteristic Er(3+) light emission from photoluminescence spectra of our samples. DTIC

EPITAXIAL IRON FILMS Annual Report, 1 Mar. 1992 - 1993
E. D. Dahlbert 15 Jun. 1993 9 p
(Contract F49620-92-J-0185)
(AD-A268286; AFOSR-93-0596TR) Avail: CASI HC A02/MF A01

This research involved studies of the magnetic properties of multilayered magnetic films and high quality thin films. Both ultra high vacuum sputtering and molecular beam epitaxy techniques were utilized to prepare the films. Both electrical transport and magneto-optic effects were used to measure the magnetic properties of the films. The primary focus during this year was to develop high quality trilayers consisting of a magnetic layer, nonmagnetic layer, and a magnetic layer. These structures are being developed to determine the scattering origin of the giant magnetoresistance phenomena. In addition, other investigations included the determination of the temperature dependence of the magnetic anisotropy energies of epitaxial iron films, the magnetization dynamics of thin films, and the general transport properties of multilayers. The transport effort utilized multilayers of magnetic and nonmagnetic metals to study the interfacial scattering. The combination of a magnetic and nonmagnetic metal in this work facilitates the origin of the scattering by use of the anisotropic magnetoresistance. DTIC

MECHANICAL PROPERTIES OF INTERFACES AND SUPERLATTICES Final Report
Ivan K. Schuller 1993 13 p
(Contract N00014-91-J-1177)
(AD-A268591) Avail: CASI HC A03/MF A01

This proposal was dedicated to the study of mechanical properties of interfaces and superlattices. These properties were correlated with growth techniques and extensive structural characterization. The principal goal of this proposal was to ascertain whether structural or electronic effects control the mechanical properties of interfaces and superlattices. Molecular Beam Epitaxy (MBE) and Sputtering were used to prepare single interfaces and multilayers. In-situ structural characterization was accomplished mainly using High Energy Electron Diffraction (HEED). Post preparation Micro-cleavage Transmission Electron Microscopy (MTEM), together with temperature dependent x-ray diffraction was performed to characterize the structure of the sample. The main successes during the last funding period of this proposal includes the simultaneous study of a variety of elastic constants of Cu/Nb, Fe/Cr, and W/Ni superlattices together with detailed structural studies, the measurement of the elastic constants of GaAs/AlAs superlattices and the development of a vibrating drum method for measurements of the biaxial modulus of thin films. In addition to the stable silica polymorph quartz, several metastable silica phases are present in Yucca Mountain. The conversion of these phases to quartz is accompanied by volume reduction and a decrease in the aqueous silica activity, which may destabilize clinoptilolite and mordenite. The primary reaction sequence for the silica phases is from opal or glass to disordered opal-CT, followed by ordering of the opal-CT and finally by the crystallization of quartz. The ordering of opal-CT takes place in the solid state, whereas the conversion of opal-CT takes place through dissolution-reprecipitation involving the aqueous phase. It is proposed that the rate of conversion of opal-CT to quartz is controlled by diffusion of defects out of a disordered surface layer formed on the crystallizing quartz. The reaction rates are observed to be dependent on temperature, pressure, degree of supersaturation, and pH. Rate equations selected from the literature appear to be consistent with observations at Yucca Mountain. DOE

SUPERSYMMETRY OF GAUGE EQUATIONS AND GEOMETRIC NONADIABATIC PHASES
A. A. Suzko 1992 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-626671; JINR-E-4-92-282) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

It is shown that nondiagonal elements of the connection operator A generate the nonadiabatic geometric phase in addition to Aharonov-Anandan one. The extra geometric phases are produced by A-singularities arising due to crossing of potential curves and in certain case of supersymmetry. The supersymmetric extension for the system of gauge equations is discussed. DOE

BREAKDOWN OF ADIABATIC INVARIANCE M.S. Thesis
Charolette V. Leigh Mar. 1993 84 p
(AD-A267246) Avail: CASI HC A05/MF A01

Adiabatic invariance, in which certain quantities of a system remain unchanged as a parameter of the system is infinitely slowly altered, plays a fundamental role in many areas of physics. For any harmonic oscillator, the adiabatic invariant is the energy divided by the frequency. When the alterations are slow but occur over a finite time, there is predicted to be an exponential suppression of the change in adiabatic invariant; that is, if epsilon is a dimensionless positive number that tends to zero in the limit of infinitely slow alterations, then the change in adiabatic invariant is proportional to exp(-1/epsilon). We report numerical simulations of three oscillators whose parameters are varied at rates ranging from very slow to very fast compared to the oscillation frequency. The models are single-degree-of-freedom oscillators that are based on simple physical

systems. The exponential suppression is not observed, which indicates that its observation may be extremely difficult or impossible. Furthermore, the change in adiabatic invariant is found tc depend upon the initial phase even in the limit of infinitely slow changes. In the case of abrupt alterations, the numerical simulations verify some theoretical calculations, but reveal that other theoretical calculations are incorrect. DTIC

NUMERICAL STUDIES OF THE PHOTOLUMINESCENCE SPECTRUM OF QUANTUM HALL SYSTEMS
X. M. Chen (Tennessee Univ., Knoxville.) and J. J. Quinn (Tennessee Univ., Knoxville.) Apr. 1993 6 p Presented at the Electronic Properties of Two-Dimensional Systems Conference, Newport, RI, 31 May - 4 Jun. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015822; CONF-9305225-1) Avail: CASI HC A02/MF A01

The eigenfunctions and eigenvalues of a system consisting of a finite number of electrons on a two dimensional plane together with a few holes on a neighboring plane are obtained by numerical diagonalization within the subspace of the lowest Landau level. The energy spectrum and ground state energy per particle are studied as a function of the Landau level degeneracy and the interlayer separation. By evaluating the square of the matrix element of the luminescence operator between the initial state with N(sub e) electrons and one hole and various final states with N(sub e) - 1 electrons and no hole, and multiplying by a delta function which conserves energy, the luminescence intensity I(omega) is obtained. (DE93-016619; LA-UR-93-2133; CONF-930866-2) Avail: CASI HC A01/MF A01

Some intriguing connections between the properties of nonlinear, noise driven systems and the nonlinear dynamics of a particular set of Hamilton's equation are discussed. A large class of Fokker-Planck equations, like the Schroedinger equation, can exhibit a transition in their spectral statistics as a coupling parameter is varied. This transition is connected to the transition to non-integrability in the Hamilton's equations. DOE

SUPERCRITICAL THERMODYNAMICS OF SULFUR AND NITROGEN SPECIES
C. A. Eckert 1993 11 p
(Contract DE-FG22-91PC-91287)
(DE93-017727; DOE/PC-91287/8) Avail: CASI HC A03/MF A01

Significant opportunity exists for the application of supercritical fluid (SCF) technology to coal processing, both for pretreatment of high sulfur coals, as well as liquefaction and treatment of coal liquids. Supercritical fluids are attractive solvents for a variety of coal processing applications because of their unusual solvating and mass transfer properties. Solubility studies have been carried out for a number of model coal and coal-liquid compounds, primarily in pure supercritical fluids. We are extending this database of model coal compound equilibria using modern techniques that have the advantage of being much more rapid than traditional techniques. Cosolvent effects on solubility are being investigated over a variety of solvent properties. In addition, specific molecular interactions are being investigated through spectroscopic techniques. The resulting data are being used to develop a chemical-physical equation of state (EOS) model of SCF solution with meaningful parameters. The equation of state will be used to predict solubility behavior, which will permit the design and tailoring of SCF cosolvent systems for specific coal processing applications. DOE

NUMERICALLY SOLVING A TRANSIENT HEAT CONDUCTION PROBLEM WITH CONVECTION AND RADIATION M.S. Thesis
David J. Albert Jun. 1993 98 p
(AD-A268521) Avail: CASI HC A05/MF A02

The transient surface temperature distribution is determined for the flat plate and sphere subjected to cooling by combined convection and radiation. In the study, the initial boundary value problem is reduced to a singular nonlinear Volterra integral equation of the second kind using the integral transform method. Several numerical techniques are introduced in an attempt to find an approximate solution of the problem: The method of successive approximations, the Runge-Kutta method, and the finite difference method. The integral equation is solved numerically by the Runge-Kutta method of orders 1, 3, and 5. In addition, the finite difference method is implemented to solve the initial boundary value problem, and the solutions are compared with those generated by the Runge-Kutta method. All the numerical results are presented graphically. Limitations and difficulties involved in these schemes are discussed. At the end, a numerical algorithm for solving the problem is proposed. DTIC

THE UNIVERSALITY OF THE SHIFT OF THE CHERN-SIMONS PARAMETER FOR A GENERAL CLASS OF BRS INVARIANT REGULARIZATIONS
G. Giavarini (Paris VII Univ., France.), C. P. Martin (Universidad Autonoma de Madrid, Cantoblanco, Spain.), and F. RuizRuiz 1993 8 p Sponsored in part by Stichting voor Fundamenteel Onderzoek der Materie, Netherlands, and Comisionn de Investigacion Cientifica y Tecnica, Spain Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract SC-900376)
(NIKHEF-H/93-03; FTUAM-93/03; LPTHE-93/06; ETN-93-94825) Avail: CASI HC A02

A biparametric family of BRS invariant regularization methods of SU(N) Chern-Simons theory (the parameters defining the family taking arbitrary values in the two dimensional real space) is presented and it is shown that the shift k (tends to) k + sign(k)N of the Chern-Simons parameter k occurs for arbitrary values of the family defining parameters. This supports irrefutably the conjecture that the shift of k is universal for BRS invariant regulators. ESA

THE RENORMALIZATION OF THE AXIAL ANOMALY IN DIMENSIONAL REGULARIZATION
S. A. Larin 1992 12 p
(NIKHEF-H/92-18; ETN-93-94823) Avail: CASI HC A03/MF A01

The prescription for the gamma(sub five) matrix within dimensional regularization in multiloop calculations is elaborated. The three loop anomalous dimension of the singlet axial current is calculated. Thoughout the calculations minimal subtraction scheme or its standard variation are used to perform renormalizations. The dimension of space time is defined in the standard way as D 4 - 2 epsilon. All calculations were performed within massless perturbative quantum chromodynamics. ESA

COEFFICIENTS FOR CALCULATING THERMODYNAMIC AND TRANSPORT PROPERTIES OF INDIVIDUAL SPECIES
Bonnie J. McBride, Sanford Gordon (Gordon, Sanford, Cleveland, OH.), and Martin A. Reno (Heidelberg Coll., Tiffin, OH.) Oct. 1993 92 p
(RTOP 505-62-52)
(NASA-TM-4513; E-7981; NAS 1.15:4513) Avail: CASI HC A05/MF A01

Libraries of thermodynamic data and transport properties are given for individual species in the form of least-squares coefficients. Values of C(sup

0)(sub p)(T), H(sup 0)(T), and S(sup 0)(T) are available for 1130 solid, liquid, and gaseous species. Viscosity and thermal conductivity data are given for 155 gases. The original C(sup 0)(sub p)(T) values were fit to a fourth-order polynomial with integration constants for H(sup 0)(T) and S(sup 0)(T). For each species the integration constant for H(sup 0)(T) includes the heat of formation. Transport properties have a different functional form. The temperature range for most of the data is 300 to 5000 K, although some of the newer thermodynamic data have a range of 200 to 6000 K. Because the species are mainly possible products of reaction, the data are useful for chemical equilibrium and kinetics computer codes. Much of the data has been distributed for several years with the NASA Lewis equilibrium program CET89. The thermodynamic properties of the reference elements were updated along with about 175 species that involve the elements carbon, hydrogen, oxygen, and nitrogen. These sets of data will be distributed with the NASA Lewis personal computer program for calculating chemical equilibria, CETPC. Author (revised)

DERIVATION OF THE VERLINDE FORMULA FROM CHERN-SIMONS THEORY AND THE G/G MODEL
M. Blau and G. Thompson May 1993 49 p
(DE93-628620; IC-93/83) Avail: CASI HC A03/MF A01 (US Sales Only)

We give a derivation of the Verlinde formula for the G(sub k) WZW model from Chern-Simons theory, without taking recourse to CFT, by calculating explicitly the partition function Z(sub (Sigma x S(sup 1))) of Sigma x S(sup 1) with an arbitrary number of labelled punctures. By a suitable gauge choice, Z(sub (Sigma x S(sup 1))) is reduced to the partition function of an Abelian topological field theory on Sigma (a deformation of non-Abelian BF and Yang-Mills theory) whose evaluation is straightforward. This relates the Verlinde formula to the Ray-Singer torsion of Sigma x S(sup 1). We derive the G(sub k)/G(sub k) model from Chern-Simons theory, proving their equivalence and give an alternative derivation of the Verlinde formula by calculating the G(sub k)/G(sub k) path integral via a functional version of the Weyl integral formula. From this point of view the Verlinde formula arises from the corresponding Jacobian, the Weyl determinant. Also, a novel derivation of the shift k(yields)k+h is given, based on the index of the twisted Dolbeault complex. DOE

REPRESENTATION IN INCREMENTAL LEARNING
1993 4 p
(Contract NCC2-658)
(NASA-CR-194595; NAS 1.26:194595) Avail: CASI HC A01/MF A01

Work focused on two areas in machine learning: representation for inductive learning and how to apply concept learning techniques to learning state preferences, which can represent search control knowledge for problem solving. Specifically, in the first area the issues of the effect of representation on learning, on how learning formalisms are biased, and how concept learning can benefit from the use of a hybrid formalism are addressed. In the second area, the issues of developing an agent to learn search control knowledge from the relative values of states, of the source of that qualitative

information, and of the ability to use both quantitative and qualitative information in order to develop an effective problem-solving policy are examined. Author (revised)

MAXIMIZING PARTICIPATION OF WOMEN IN COLLEGIATE AVIATION EDUCATION Ph.D. Thesis
Jacqueline R. Luedtke Jul. 1993 112 p
(NIAR-93-14) Avail: CASI HC A06/MF A02

The purpose of this study is to collect and analyze information which can be used to examine the reasons for the seemingly low number of women in the United States' collegiate aviation educational system. With ever-increasing global competition, it is vital to assist all qualified persons in the aviation field to succeed in their chosen area of this profession. Only by utilizing all trained persons, men and women, will the United States remain competitive in aviation. With women comprising such a large percentage of the work force, it is only logical to employ the best and brightest of both genders to accomplish this goal. Data will be collected directly from program directors and/or aviation faculty at each participating member institution in the UAA with a four-year degree program in aviation. These directors and faculty members can offer insight into whether or not women are, in fact, under-represented in higher aviation education, and, if so, what they believe can be done to rectify this situation. They will be able to evaluate the status of aviation education and what the future needs might be. This research endeavor will attempt to determine what progress has been made in recent years to increase the percentage of women in collegiate aviation education. Both factual data and perceptions from the respondents will be acquired. By analyzing the history of women aviation educators, this study hopes to offer means of maximizing participation of women in collegiate aviation education. Recommendations for improvements which will allow the integration of women more readily into this field will be sought. The information gathered through this study will allow persons in higher aviation education at all colleges and universities and at the University Aviation Association to better understand the role women should be playing in this field. Such information will also be useful to the aviation industry at large as women become a larger force in this area of study and expertise. Author

THE IMPACT OF INDUSTRY/UNIVERSITY CONSORTIA PROGRAMS ON SPACE EDUCATION
John R. Page (New South Wales Univ., Kensington, Australia.) and Barbara A. Stone 1993 7 p Presented at the 44th Congress of the IAF Symposium on Space and Education, Graz, Austria, 16-22 Oct. 1993
(NASA-TM-109340; NAS 1.15:109340; IAF-93-P.2.365) Copyright Avail: Issuing Activity

Australia and the United States have each established industry/university consortia programs to facilitate and promote the development of their space industry. The universities also benefit from being involved in the discipline associated with real commercial space projects and access to current industrial practice. Generically, the consortia are composed of universities and companies seeking to identify and exploit potentially commercially-significant technologies. Australia has two programs: Space Industry Development Centers (spacebased technologies) and Cooperative Research Centers (not limited to space research but including Centers with a space interest). In the United States, the Centers for the Commercial Development of Space Program was established in 1985 to stimulate interest and expand private sector investment in commercial space activities. This paper examines these programs from the standpoint of their impact on space education in their respective counties. Author

HSTS: INTEGRATING PLANNING AND SCHEDULING
Nicola Muscettola Mar. 1993 40 p
(Contract F30602-91-F-0016)
(AD-A266991; CMU/RI-TR-93-05) Avail: CASI HC A03/MF A01

In the traditional approach to managing complex systems, planning and scheduling are two very distinct phases. However, in a wide variety of applications this strict separation is not possible or beneficial. During scheduling it is often necessary to make planning decisions (plan the setup of a machine); moreover planning decisions can benefit from scheduling information (choose a process plan depending on resource loads). HSTS (Heuristic Scheduling Testbed System) is a representation and problem solving framework that provides an integrated view of planning and scheduling. HSTS emphasizes the decomposition of a domain into state variables evolving over continuous time. This allows the description and manipulation of resources far more complex than it is possible in classical scheduling. The inclusion of time and resource capacity into the description of causal justifications allows a fine-grain integration of planning and scheduling and a better adaptation to problem and domain structure. HSTS puts special emphasis on leaving as much temporal flexibility as possible during the planning/scheduling process to generate better plan/schedules with less computation effort. Within the HSTS framework we have implemented several planning/scheduling systems. In the paper we describe an integrated planner and scheduler for short term scheduling of the Hubble Space Telescope. This system has demonstrated the ability to deal effectively with all of the important constraints of the domain. Experimental results show that executable schedules for Hubble can be built in a time compatible with operational needs. The paper also describes a methodology for job-shop scheduling problems. The methodology exploits the temporal flexibility provided by HSTS. DTIC

(NASA-TM-109324; NAS 1.15:109324) Avail: CASI HC A03/MF A01

This new, unique Cost Engineering Report introduces the 800-page, C-100 government estimate for the Space Station Processing Facility (SSPF) and Volume IV Aerospace Construction Price Book. At the January 23, 1991, bid opening for the SSPF, the government cost estimate was right on target. Metric, Inc., Prime Contractor, low bid was 1.2 percent below the government estimate. This project contains many different and complex systems. Volume IV is a summary of the cost associated with construction, activation and Ground Support Equipment (GSE) design, estimating, fabrication, installation, testing, termination, and verification of this project. Included are 13 reasons the government estimate was so accurate; abstract of bids, for 8 bidders and government estimate with additive alternates, special labor and materials, budget comparison and system summaries; and comments on the energy credit from local electrical utility. This report adds another project to our continuing study of 'How Does the Low Bidder Get Low and Make Money?' which was started in 1967, and first published in the 1973 AACE Transaction with 18 ways the low bidders get low. The accuracy of this estimate proves the benefits of our Kennedy Space Center (KSC) teamwork efforts and KSC Cost Engineer Tools which are contributing toward our goals of the Space Station. THE IMPACT OF REPORT OF INVESTIGATION WRITING STYLE ON THE ASSESSMENT TIMES, IMPRESSIONS, PERCEPTIONS AND PREFERENCES OF ADJUDICATORS Technical Report
James E. Suchan (Naval Postgraduate School, Monterey, CA.) and Mark LaViolette Jan. 1993 95 p
(AD-A265748; PERS-TR-93-003) Avail: CASI HC A05/MF A01

This report examines the effect of style of written communication on processing of information and readers' perceptions of the writer. Forty senior adjudicators from four sites reviewed two cases containing significant derogatory information. The reports of investigation (ROI's) were written in two styles: high- and low-impact. High-impact reports were designed to facilitate information processing through structural and stylistic features such as lists, bullets, active verbs and subject-verb-object sentence construction. The results show that adjudicators prefer a high-impact ROI for its presentation of information, ease of reading, remembering and applying adjudication criteria, and limited amount of re-reading. With the high-impact ROI adjudicators also formed a more favorable impression of the quality of investigation and the competence of field agents. There was no evidence of a shorter reading time for high-impact ROI's. DTIC

NASA TREND ANALYSIS PROCEDURES
Oct. 1993 71 p
(NASA-RP-1290; NAS 1.61:1290) Avail: CASI HC A04/MF A01

This publication is primarily intended for use by NASA personnel engaged in managing or implementing trend analysis programs. 'Trend analysis' refers to the observation of current activity in the context of the past in order to infer the expected level of future activity. NASA trend analysis was divided into 5 categories: problem, performance, supportability, programmatic, and reliability. Problem trend analysis uncovers multiple occurrences of historical hardware or software problems or failures in order to focus future corrective action. Performance trend analysis observes changing levels of real-time or historical flight vehicle performance parameters such as temperatures, pressures, and flow rates as compared to specification or 'safe' limits. Supportability trend analysis assesses the adequacy of the spaceflight logistics system; example indicators are repair-turn-around time and parts stockage levels. Programmatic trend analysis uses quantitative indicators to evaluate the 'health' of NASA programs of all types. Finally, reliability trend analysis attempts to evaluate the growth of system reliability based on a decreasing rate of occurrence of hardware problems over time. Procedures for conducting all five types of trend analysis are provided in this publication, prepared through the joint efforts of the NASA Trend Analysis Working Group. Author (revised)

PERMANENT CHANGE OF STATION: THE NASA EMPLOYEE'S GUIDE TO AN EASIER MOVE
Apr. 1993 68 p
(NHB-9760.1A; NAS 1.18:9760.1A) Avail: CASI HC A04/MF A01

This guide is for the NASA employee preparing to make a permanent change of station. Whether a transferee or a new appointee, this guide contains information that will help a Government-authorized move go more smoothly from start to finish. The guide outlines the allowances and expense reimbursements one is entitled to under Federal Travel Regulations (FTR). It provides samples of forms one may need to fill out to start the transfer rolling and to claim reimbursements. However, it is important to note that this guide is not a copy of the FTR. Information in the FTR and the NASA Travel Regulations, FMM 9760, is far more detailed and is always updated and correct. Derived from text

FACILITIES MAINTENANCE HANDBOOK

Dec. 1991 283 p

(NHB-8831.2; NAS 1.18:8831.2) Avail: CASI HC A13/MF A03

This handbook is a guide for facilities maintenance managers. Its objective is to set minimum facilities maintenance standards. It also provides recommendations on how to meet the standards to ensure that NASA maintains its facilities in a manner that protects and preserves its investment in the facilities in a cost-effective manner while safely and efficiently performing its mission. This handbook implements NMI 8831.1, which states NASA facilities maintenance policy and assigns organizational responsibilities for the management of facilities maintenance activities on all properties under NASA jurisdiction. It is a reference for facilities maintenance managers, not a step-by-step procedural manual. Because of the differences in NASA Field Installation organizations, this handbook does not assume or recommend a typical facilities maintenance organization. Instead, it uses a systems approach to describe the functions that should be included in any facilities maintenance management system, regardless of its organizational structure. For documents referenced in the handbook, the most recent version of the documents is applicable. This handbook is divided into three parts: Part 1 specifies common definitions and facilities maintenance requirements and amplifies the policy requirements contained in NMI 8831. 1; Part 2 provides guidance on how to meet the requirements of Part 1, containing recommendations only; Part 3 contains general facilities maintenance information. One objective of this handbook is to fix commonality of facilities maintenance definitions among the Centers. This will permit the application of uniform measures of facilities conditions, of the relationship between current replacement value and maintenance resources required, and of the backlog of deferred facilities maintenance. The utilization of facilities maintenance system functions will allow the Centers to quantitatively define maintenance objectives in common terms, prepare work plans, and develop management information in order to statistically identify and analyze variances from those plans. It will also add credibility to the NASA facilities maintenance budgeting process. The key to a successful maintenance program is the understanding and support of the senior Center managers. NASA SECURITY HANDBOOK

Feb. 1993 361 p

(NHB-1620.3C; NAS 1.18:1620.3C) Avail: CASI HC A16/MF A03

This 'NASA Security Handbook' provides basic information regarding the assignment of individual security responsibilities within NASA. It sets forth minimum standards, procedures, specifications, and guidelines for the protection of classified information, material, facilities, and property in the possesion of NASA. It expands upon and further specifies NASA security policy spelled out in NMI 1600.2. This Handbook implements the provisions of Executive Order 12356, 'National Security Information,' dated April 2, 1982, 'Information Security Oversight Office Directive No. 1 Concerning National Security Information,' dated June 25, 1982, Executive Order 10450, 'Security Requirements for Government Employees' dated April 27, 1953, and the Federal Personnel Manual, Chapters 731, 732, and 736.

The NASA Industrial Labor Relations Manual provides internal guidelines and procedures to assist NASA Field Installations in dealing with contractor labor management disputes, Service Contract Act variance hearings, and to provide access of Labor Union Representatives to NASA for the purpose of maintaining schedules and goals in connection with vital NASA programs. This manual will be revised by page changes as revisions become necessary. Initial distribution of this manual has been made to NASA Headquarters and Field Installations. Derived from text

THE NASA COMPETITIVE PLACEMENT PLAN FOR POSITIONS GS-15 AND BELOW (INCLUDING TRADES AND LABOR POSITIONS)

1 Feb. 1993 19 p

(NHB-3335.1C; NAS 1.18:3335.1C) Avail: CASI HC A03/MF A01

This plan provides the framework for selection based on merit from among the best qualified candidates available. Selections will be made without regard to political, religious, or labor organization affiliation or nonaffiliation, marital status, race, color, sex, national origin, nondisqualifying disability, or age. This plan does not guarantee promotion but rather ensures that all qualified available candidates receive fair and equitable consideration for positions filled under these competitive procedures. Announcing a vacancy under this plan is only one method of locating applicants for a position and can be used in conjunction with other methods. Subject to applicable law and regulation, selection of an individual to fill a position is the decision of management, as is the decision as to the method(s) to be used in identifying candidates. This plan is applicable to all NASA Installations. It covers all positions in the competitive service at (and below) the GS/GM-15 level (including all trades and labor positions), except positions in the Office of the Inspector General. The requirements herein are not intended to, nor should they be construed to limit in any way, the independent personnel authority of the Inspector General under the Inspector General Act, as Amended. THE SENIOR EXECUTIVE SERVICE

Dec. 1992 42 p

(NHB-3100.6; NAS 1.18:3100.6) Avail: CASI HC A03/MF A01

A major innovation of the Civil Service Reform Act of 1978 was the creation of a Senior Executive Service (SES). The purpose of the SES is both simple and bold: to attract executives of the highest quality into Federal service and to retain them by providing outstanding opportunities for career growth and reward. The SES is intended to: provide greater authority in managing executive resources; attract and retain highly competent executives, and assign them where they will effectively accomplish their missions and best use their talents; provide for systematic development of executives; hold executives accountable for individual and organizational performance; reward outstanding performers and remove poor performers; and provide for an executive merit system free of inappropriate personnel practices and arbitrary actions. This Handbook summarizes the key features of the SES at NASA. It is intended as a special welcome to new appointees and also as a general reference document. It contains an overview of SES management at NASA, including the Executive Resources Board and the Performance Review Board, which are mandated by law to carry out key SES functions. In addition, assistance is provided by a Senior Executive Committee in certain reviews and decisions and by Executive Position Managers in day-to-day administration and oversight. Derived from text

EQUIPMENT MANAGEMENT USER'S HANDBOOK FOR PROPERTY CUSTODIANS

Mar. 1993 86 p

(NHB-4200.2A; NAS 1.18:4200.2A) Avail: CASI HC A05/MF A01

The NASA Equipment Management User's Handbook for Property Custodians is issued as an instructional guide for personnel designated as property custodians and technical personnel involved in the acquisition, management, and use of NASA-owned equipment. This handbook provides general information and basic operational procedures for processing equipment transactions through the agency-wide NASA Equipment Management System (NEMS). Each NASA installation must prepare

supplementary instructions for local requirements beyond the scope of NASA-wide policies and procedures contained herein, or as specified for local implementation in NHB 4200.1, 'NASA Equipment Management Manual.' NHB 4200.1 sets forth policy, uniform performance standards, and procedural guidance to NASA personnel for the acquisition, management, and use of NASA-owned equipment. This handbook is a controlled document, issued in loose-leaf form and revised by page changes. Additional copies for internal use may be obtained through normal distribution. Author (revised)

DESIGN QUALITY TASK FORCE SURVEY COMMENTS Final Report, Feb. - Apr. 1992
Larry Lang May 1993 64 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A266283; CETEC-ES-P-93-7) Avail: CASI HC A04

In November 1991, the U.S. Army Corps of Engineers (USACE) commissioned a Design Quality Task Force (DQTF). Its objective was to identify problems with, and recommend improvements in the quality of, design products in the Corps' Engineering Divisions. As part of this overall effort, the Engineer Strategic Studies Center (ESSC) performed a comprehensive district-level survey in Feb. 1992 to assess the importance of issues and the Corps' perception of where it is performing today on these issues. The questionnaire collected data by program (Civil Works and Military Construction), by function (Planning, Construction, Program and Project Management (PPM), Operations, and Engineering), and by position (Division Chief, Branch/Section Chief, or Journeyman). Approximately one-third of the 1231 people who returned questionnaires wrote in optional comments. This report contains verbatim comments from the questionnaire forms. The report has a section for each function, and comments for each function are sorted by position. These comments provide grass roots insight into Design Quality in USACE. DTIC

THE EARLY ACTIVITIES OF THE COPERS AND THE DRAFTING OF THE ESRO CONVENTION (1961/62)
John Krige Jan. 1993 47 p
(ESA-HSR-4) Avail: CASI HC A03/MF A01

The aim of this report is to describe the main activities of these two groups, particularly in so far as they bore on the drafting of the convention of the new European Space Research Organization (ESRO). This convention was laid before an intergovernmental conference in Paris on 14 and 15 June 1962. By restricting our time span and our subject matter in this way we do not, of course, deal with all matters handled by the working groups in this period, and not by the LAFWG in particular (staff policy and internal structure, privileges and immunities, etc.). We do, however, throw into relief the most significant issues which were 'settled' in the run up to the signature of the convention, so exploring in depth the history of some key clauses in that important legal document. MISSION MANAGEMENT AIRCRAFT OPERATIONS MANUAL
Mar. 1992 75 p
(NHB-7900.3; NAS 1.18:7900.3) Avail: CASI HC A04/MF A01

This manual prescribes the NASA mission management aircraft program and provides policies and criteria for the safe and economical operation, maintenance, and inspection of NASA mission management aircraft. The operation of NASA mission management aircraft is based on the concept that safety has the highest priority. Operations involving unwarranted risks will not be tolerated. NASA mission management aircraft will be designated by the Associate Administrator for Management Systems and Facilities. NASA mission management aircraft are public aircraft as defined by the Federal Aviation Act of 1958. Maintenance standards, as a minimum, will meet those required for retention of Federal Aviation Administration (FAA) airworthiness certification. Federal Aviation Regulation Part 91, Subparts A and B, will apply except when requirements of this manual are more restrictive. Derived from text

AIRCRAFT OPERATIONS MANAGEMENT MANUAL
Mar. 1992 80 p
(NHB-7900.3(V1); NAS 1.18:7900.3(V1)) Avail: CASI HC A05/MF A01

The NASA aircraft operations program is a multifaceted, highly diverse entity that directly supports the agency mission in aeronautical research and development, space science and applications, space flight, astronaut readiness training, and related activities through research and development, program support, and mission management aircraft operations flights. Users of the program are interagency, inter-government, international, and the business community. This manual provides guidelines to establish policy for the management of NASA aircraft resources, aircraft operations, and related matters. This policy is an integral part of and must be followed when establishing field installation policy and procedures covering the management of NASA aircraft operations. Each operating location will develop appropriate local procedures that conform with the requirements of this handbook. This manual should be used in conjunction with other governing instructions, handbooks, and manuals. Author

Avail: CASI HC A01/MF A02

During this quarter studies were extended to determine the electronic contribution to the perpendicular interface anisotropy in Co-based multilayers. Using in situ Kerr effect measurements, the influences of different transition metals (TM = Ag, Au, Cu, and Pd) on the magnetic properties of single-crystal Co films grown on Pd (111) and Au (111) surfaces are investigated. Last quarter the discovery of a large peak in the perpendicular anisotropy when approximately one monolayer of Cu or Ag is deposited on the Co surface was reported. We now have added a computer-controlled stepper-motor drive to our MBE sample transfer mechanism. The motor allows us to move the sample at a constant velocity from behind a shutter during deposition. The film, therefore, is deposited as a wedge with a linear variation of thickness across the substrate. In this way, a continuous range of coverage on a single sample is studied. The stepper motor also provides the necessary control for precisely positioning the sample in the laser beam for Kerr effect measurements at the different coverages.

MeV ION-BEAM ANALYSIS OF OPTICAL DATA STORAGE FILMS
J. A. Leavitt, L. C. McIntyre, Jr., and Z. Lin *In its* Research Studies on Advanced Optical Module/Head Designs for Optical Disk Recording Devices 15 Mar. 1993 p 11-13 (For primary document see N94-14981 03-82)
Avail: CASI HC A01/MF A02

Our objectives are threefold: (1) to accurately characterize optical data storage films by MeV ion-beam analysis (IBA) for ODSC collaborators; (2) to develop new and/or improved analysis techniques; and (3) to expand the capabilities of the IBA facility itself. Using H-1(+), He-4(+), and N-15(++) ion beams in the 1.5 MeV to 10 MeV energy range from a 5.5 MV Van de Graaff accelerator, film thickness (in atoms/sq cm), stoichiometry, impurity concentration profiles, and crystalline structure were determined by Rutherford backscattering (RBS), high-energy backscattering, channeling, nuclear reaction analysis (NRA) and proton induced X-ray emission (PIXE). Most of these techniques are discussed in detail in the ODSC Annual Report (February 17, 1987), p. 74. The PIXE technique is briefly discussed in the ODSC Annual Report (March 15, 1991), p. 23.

MEASUREMENT OF BIREFRINGENCE FOR OPTICAL RECORDING DISK SUBSTRATES
Hong Fu, S. Sugaya (Nippon Electric Co. Ltd., Japan.), J. K. Erwin, T. Goodman, Z. Yan, W. J. Tang, and M. Mansuripur *In its* Research Studies on Advanced Optical Module/Head Designs for Optical Disk Recording Devices 15 Mar. 1993 p 37-75 (For primary document see N94-14981 03-82)
Avail: CASI HC A03/MF A02

The birefringence of bare and coated substrates for magneto-optical recording is experimentally investigated using ellipsometry at the wavelengths of 632.8 nm and 780 nm. The rotation and ellipticity of the polarization state of the reflected or transmitted light is measured for different incident angles and different orientations of the incident linear polarization. The measured data is then fitted by a computer program which solves the Maxwell equations for the plane-wave propagation in a multilayer structure and minimizes the error between the measured and calculated data by adjusting the unknown parameters of the multilayer. This approach enables us to determine orientations of the three principal axes in the substrate and the corresponding refractive indices. A special feature of our ellipsometers is that a glass hemisphere is placed in contact with the substrate, which eliminates the refraction of the incident light and enables a maximum propagation angle of 70 degrees (with respect to the normal) in the substrate. This increases the sensitivity of the measurement. Certain anomalies were observed, which we believe are associated with the presence of grooves on these substrates. Author (revised)

RING LENS FOCUSING AND PUSH-PULL TRACKING SCHEME FOR OPTICAL DISK SYSTEMS
R. Gerber, J. Zambuto, J. K. Erwin, and M. Mansuripur *In its* Research Studies on Advanced Optical Module/Head Designs for Optical Disk Recording Devices 15 Mar. 1993 p 79-105 (For primary document see N94-14981 03-82)
Avail: CASI HC A03/MF A02

An experimental comparison of the ring lens and the astigmatic techniques of generating focus-error-signal (FES) in optical disk systems reveals that the ring lens generates a FES over two times steeper than that produced by the astigmat. Partly due to this large slope and, in part, because of its diffraction-limited behavior, the ring lens scheme exhibits superior performance characteristics. In particular the undesirable signal known as 'feedthrough' (induced on the FES by track-crossings during the seek operation) is lower by a factor of six compared to that observed with the astigmatic method. The ring lens is easy to align and has reasonable tolerance for positioning errors. Author (revised)

MAGNETIC AND MAGNETO-OPTICAL PROPERTIES AND DOMAIN STRUCTURE OF Co/Pd MULTILAYERS
S. Gadetsky, Teho Wu, T. Suzuki (International Business Machines Corp., San Jose, CA.), and M. Mansuripur *In its* Research Studies on Advanced Optical Module/Head Designs for Optical Disk Recording Devices 15 Mar. 1993 p 109-132 (For primary document see N94-14981 03-82)
Avail: CASI HC A03/MF A02

The domain structure of Co/Pd(1.6/6.3 A)xN multilayers and its relation to the bulk magnetic properties of the samples were studied. The Co/Pd multilayers were deposited by rf and dc magnetron sputtering onto different substrates. It was found that magnetic and magnetooptical properties and domain structure of the multilayers were affected by total film thickness and substrate condition. Magnetization, coercivity, and anisotropy of the films decreased significantly as the film thickness dropped below 100 A. However, Kerr rotation angle had a maximum at the same thickness. The width of the domain structure increased with the decrease of the film thickness attaining the single domain state at N = 10. The initial curves in Co/Pd multilayers were found to depend on demagnetization process. The samples demagnetized by inplane field showed the largest difference between initial curves and the corresponding parts of the loops. Different domain structures were observed in the samples demagnetized by perpendicular and in-plane magnetic fields. Author (revised)

DETERMINATION OF AVERAGE REFRACTIVE INDEX OF SPIN COATED DCG FILMS FOR HOE FABRICATION **c35**
T. J. Kim, Eugene W. Campbell, and Raymond K. Kostuk *In its* Research Studies on Advanced Optical Module/Head Designs for Optical Disk Recording Devices 15 Mar. 1993 p 135-144 (For primary document see N94-14981 03-82)
Avail: CASI HC A02/MF A02

The refractive index of holographic emulsions is an important parameter needed for designing holographic optical elements (HOE's). Theoretical calculations of the accuracy required for the refractive index and thickness of emulsions needed to meet predetermined Bragg angle conditions are presented. A modified interferometric method is used to find average refractive index of the unexposed and the developed dichromated gelatin holographic films. Slanted transmission HOE's are designed considering the index and thickness variations, and used to verify the index measurement results. The Brewster angle method is used to measure surface index of the unexposed and the developed films. The differences between average index and surface index are discussed. Theoretical calculation of the effects of index variation on diffraction efficiency, and experimental results for index modulation variation caused by process changes are also presented. Mar. 1993 p 153-159 (For primary document see N94-14981 03-82)
Avail: CASI HC A02/MF A02

It was shown how full-width at half maximum (FWHM), full-width at 1/e(sup 2) (FW1/e(sup 2)), Strehl ratio, and encircled energy figures of merit vary with different types of aberration and measurement methods. The array sampling method and the slit-scan method are examined in detail. Our irradiance in the exit pupil of the optical system is a simple gaussian. It was found that in general the slit-scan method and the array method do not yield the same result. The width measurements for the central lobe of the diffraction pattern are very insensitive to aberration.

DETERMINING THE LOCATIONS OF THE VARIOUS CIRC RECORDING FORMAT INFORMATION BLOCKS (USER DATA BLOCKS, C2 AND C1 WORDS AND EFM FRAMES) ON A RECORDED COMPACT DISC
Dennis G. Howe *In its* Research Studies on Advanced Optical Module/Head Designs for Optical Disk Recording Devices 15 Mar. 1993 p 175-186 (For primary document see N94-14981 03-82)
Avail: CASI HC A03/MF A02

Just prior to its being EFM modulated (i.e., converted to eight-to-fourteen channel data by the EFM encoder) and written to a Compact Disc (CD), information that passes through the CIRC Block Encoder is grouped into 33-byte blocks referred to as EFM frames. Twenty four of the bytes that make up a given EFM frame are user data that was input into the CIRC encoder at various (different) times, 4 of the bytes of this same EFM frame were created by the C2 ECC encoder (each at a different time), and another 4 were created by the C1 ECC encoder (again, each at a different time). The one remaining byte of the given EFM frame, which is known as the EFM frame C&D (for Control & Display) byte, carries information that identifies which portion of the current disc program track the given EFM frame belongs to and also specifies the location of the given EFM frame on the disc (in terms of a time stamp that has a resolution of 1/75th second, or 98 EFM frames). (Note: since the program track and time information is stored as a 98-byte word, a logical group consisting of 98 consecutive EFM frames must be read, and their respective C&D bytes must be catenated and decoded, before the program track identification and time position information that pertains to the entire block of 98 EFM frames can be obtained.) The C&D byte is put at the start (0th byte) of an EFM frame in real time; its placement completes the construction of the EFM frame - it is assigned just before the EFM frame enters the EFM encoder. Four distinct blocks of data are referred to: 24-byte User Input Data Blocks; 28-byte C2 words; 32-byte C1 words; and 33-byte EFM frames.

NASA'S ONLINE MACHINE AIDED INDEXING SYSTEM Final Report
June P. Silvester (RMS Associates, Linthicum Heights, MD.), Michael T. Genuardi (RMS Associates, Linthicum Heights, MD.), and Paul H. Klingbiel (RMS Associates, Linthicum Heights, MD.) Sep. 1993 60 p
(Contract NASw-4584)
(NASA-CR-4518; NAS 1.26:4518) Avail: CASI HC A04/MF A01

This report describes the NASA Lexical Dictionary, a machine aided indexing system used online at the National Aeronautics and Space Administration's Center for Aerospace Information (CASI). This system is comprised of a text processor that is based on the computational, non-syntactic analysis of input text, and an extensive 'knowledge base' that serves to recognize and translate text-extracted concepts. The structure and function of the various NLD system components are described in detail. Methods used for the development of the knowledge base are discussed. Particular attention is given to a statistically-based text analysis program that provides the knowledge base developer with a list of concept-specific phrases extracted from large textual corpora. Production and quality benefits resulting from the integration of machine aided indexing at CASI are discussed along with a number of secondary applications of NLD-derived systems including on-line spell checking and machine aided lexicography.

THE THIRD ANNUAL NASA SCIENCE INTERNET USER WORKING GROUP CONFERENCE
Brian S. Lev, ed. (Hughes STX, Inc., Lanham, MD.) and J. Patrick Gary, ed. Washington May 1993 464 p Conference held in Greenbelt, MD, 30 Mar. - 3 Apr. 1992
(RTOP 656-63-00)
(NASA-CP-3170; Rept-93B00048; NAS 1.55:3170) Avail: CASI HC A20/MF A04

The NASA Science Internet (NSI) User Support Office (USO) sponsored the Third Annual NSI User Working Group (NSIUWG) Conference March 30 through April 3, 1992, in Greenbelt, MD. Approximately 130 NSI users attended to learn more about the NSI, hear from projects which use NSI, and receive updates about new networking technologies and services. This report contains material relevant to the conference; copies of the agenda, meeting summaries, presentations, and descriptions of exhibitors. Plenary sessions featured a variety of speakers, including NSI project management, scientists, and NSI user project managers whose projects and applications effectively use NSI, and notable citizens of the larger Internet community. The conference also included exhibits of advanced networking applications; tutorials on internetworking, computer security, and networking technologies; and user subgroup meetings on the future direction of the conference, networking, and user services and applications.

CLASSIFIED INFORMATION: VOLUME COULD BE REDUCED BY CHANGING RETENTION POLICY
May 1993 44 p
(AD-A266938; GAO/NSIAD-93-127) Avail: CASI HC A03/MF A01

The U.S. government maintains a large but unquantifiable volume of classified documents, some dating to before World War II. The Chairmen, House Committees on Government Operations and on Foreign Affairs, expressed concerns about whether this is warranted and asked GAO to review the classification of national security information. Accordingly, GAO examined the reasons for the retention of large volumes of documents as

classified for long periods of time. GAO also reviewed documents for classification errors, reports on government-wide classification and declassification activity and adherence to policies and procedures, and various executive orders that have governed national security information. DTIC

A TRALINET GUIDE TO THE INTERNET Final Report
Leroy Bell and Ed Burgess Jun. 1993 32 p
(AD-A266946) Avail: CASI HC A03/MF A01

This workbook was put together for the benefit of TRALINET librarians. It addresses some specific problems that TRADOC libraries will face in accessing Internet resources. Some assumptions: Most TRALINET librarians will go through Profs. Most use an IBM 4381 running the VM operating system. About half of all TRALINET libraries dial into Profs using a modem and communications software. In some cases, this workbook will talk about commands and practices which are in use at Fort Monroe. Readers should be aware that those practices are not universal. The reader is advised to speak with the local system administrators. Anyone wishing to actually do work on the Internet is advised to bring along an extra helping of patience. Partly because of the hosts that TRADOC uses, and partly because the reality of the software you will be interacting with is far removed from the promotional literature, Internet surfers often get stuck. The Internet is new, evolving, constantly changing, designed by computer systems people rather than information retrieval people. Things don't always go as well as one would hope. DTIC

NASA DIRECTIVES MASTER LIST AND INDEX
31 Mar. 1993 95 p
(NHB-1410.13L) Avail: CASI HC A05/MF A01

This Handbook sets forth in two parts the following information for the guidance of users of the NASA Management Directives System. Part A is a master list of management directives in force as of March 31, 1993. Chapter 1 contains introductory informative material on how to use this Handbook. Chapter 2 is a complete master list of Agencywide management directives, describing each directive by type, number, effective date, expiration date, title, and organization code of the office responsible for the directive. Chapter 3 includes a consolidated numerical list of all delegations of authority and a breakdown of such delegation by the office or installation to which special authority is assigned. Chapter 4 sets forth a consolidated list of all NASA Handbooks (NHB's) and important footnotes covering the control and ordering of such documents. Chapter 5 is a consolidated list of NASA management directives applicable to the Jet Propulsion Laboratory. Chapter 6 is a consolidated list of NASA management directives published in the Code of Federal Regulations. Complementary manuals to the NASA Management Directives System are described in Chapter 7. Part B is the index to NASA management directives in force as of March 31, 1993. This part contains an in-depth alphabetical index to all NASA management directives other than Handbooks. NHB's 1610.6, 'NASA Personnel Security Handbook,' 1620.3, 'NASA Physical Security Handbook,' 1640.4, 'NASA Information Security Program,' 1900.1, 'Standards of Conduct for NASA Employees,' 5103.6, 'Source Evaluation Board Handbook,' and 7400.1, 'Budget Administration Manual,' are indexed in-depth. All other NHB's are indexed by titles only. Derived from text

DEPARTMENT OF DEFENSE TECHNICAL ARCHITECTURE FRAMEWORK FOR INFORMATION MANAGEMENT. VOLUME 3: ARCHITECTURE CONCEPTS AND DESIGN GUIDANCE, VERSION 2.0
John Keane 22 Jun. 1993 97 p
(AD-A267195) Avail: CASI HC A05/MF A02

For purposes of the Technical Architecture Framework for Information Management (TAFIM), an information system may be characterized as composed of the following components: data; mission-specific applications; and a technical infrastructure consisting of support applications, computing platforms, and communications networks. This document presents the technical architecture concepts and the design guidance for information systems in the Department of Defense (DoD). As part of the TAFIM, this volume provides guidance for the evolution of the Department's technical infrastructure in support of specific mission requirements. The data and mission-specific software architectures are critical elements in information system development. Guidance on their development and use will be provided in separate documents outside of the TAFIM. DTIC

NASA/DOD AEROSPACE KNOWLEDGE DIFFUSION RESEARCH PROJECT. PAPER 32: A NEW ERA IN INTERNATIONAL TECHNICAL COMMUNICATION: AMERICAN-RUSSIAN COLLABORATION
Madelyn Flammia (University of Central Florida, Orlando.), Rebecca O. Barclay (Rensselaer Polytechnic Inst., Troy, NY.), Thomas E. Pinelli, Michael L. Keene (Tennessee Univ., Knoxville.), Robert H. Burger (Illinois Univ., Urbana.), and John M. Kennedy (Indiana Univ., Bloomington.) 1993 6 p Presented at the International Professional Communication Conference, Philadelphia, PA, 5-8 Oct. 1993
(NASA-TM-109336; NAS 1.15:109336) Avail: CASI HC A02/MF A01

Until the recent dissolution of the Soviet Union, the Communist Party exerted a strict control of access to and dissemination of scientific and technical information (STI). This article presents models of the Soviet-style information society and the Western-style information society and discusses the effects of centralized governmental control of information on Russian technical communication practices. The effects of political control on technical communication are then used to interpret the results of a survey of Russian and U.S. aerospace engineers and scientists concerning the time devoted to technical communication, their collaborative writing practices and their attitudes toward collaboration, the kinds of technical documents they produce and use, their views regarding the appropriate content for an undergraduate technical communication course, and their use of computer technology. Finally, the implications of these findings for future collaboration between Russian and U.S. engineers and scientists are examined. Author

INDEX OF NASA PREFIXED FORMS
Jan. 1992 34 p
(NHB-1420.21; NAS 1.18:1420.21) Avail: CASI HC A03/MF A01

This Handbook sets forth information for the guidance of all users of the NASA Forms Management Program System. It is issued in accordance with the Federal Information Resources Management Regulation (FIRMR), Subpart 201-9.1. This Handbook sets forth an alpha-functional index of NASA-prefixed forms by title, identifying number, and unit of issue. The automated processing two-letter code (NF) has been substituted for the spelling out of the NASA form-prefix preceding the form number. To indicate a description in lieu of a distinct title, the entire reference under the Form Title/Description column has been enclosed in parentheses. A list of current forms, shown by number and page, is included for cross-reference and to preclude the ordering of those forms which have been deleted from the system. This Handbook will be updated, as appropriate. NHB 1420.2H dated July 1986, is cancelled. Derived from text

NASA INFORMATION RESOURCES MANAGEMENT HANDBOOK
Apr. 1992 218 p
(NHB-2410.1E; NAS 1.18:2410.1E) Avail: CASI HC A10/MF A03

This National Aeronautics and Space Administration (NASA) Handbook (NHB) implements recent changes to Federal laws and regulations involving the acquisition, management, and use of Federal Information Processing (FIP) resources. This document defines NASA's Information Resources Management (IRM) practices and procedures and is applicable to all NASA personnel. The dynamic nature of the IRM environment requires that the controlling management practices and procedures for an Agency at the leading edge of technology, such as NASA, must be periodically updated to reflect the changes in this environment. This revision has been undertaken to accommodate changes in the technology and the impact of new laws and regulations dealing with IRM. The contents of this document will be subject to a complete review annually to determine its continued applicability to the acquisition, management, and use of FIP resources by NASA. Updates to this document will be accomplished by page changes. This revision cancels NHB 2410.1D, dated April 1985. Derived from text

METHOD FOR RESTRUCTURING A DATABASE USING A RELATIONAL DATABASE SCHEME DERIVED BY SELECTING SUBSCHEME JOINS TO AVOID CYCLES Patent
Allen D. Parks, inventor (to Navy) 22 Jun. 1993 6 p Filed 9 Jul. 1990 Supersedes AD-D014755
(AD-D015816; US-Patent-5,222,233; US-Patent-Appl-SN-551104; US-Patent-Class-395-600) Avail: US Patent and Trademark Office

A method for relational database scheme design with the aid of a digital computer for a database having attributes A(sub i), i = 1 to n and relational schemes R(sub j), j = 1 to m is described. Each relational scheme Rj is a non-empty subset of the attributes Ai. The method detects any scheme that is non-acyclic in a simple manner that is easily adapted to a digital computer environment. The resulting relational database scheme design is thereby prevented from being non-acyclic. DTIC

NASA ELECTRONIC LIBRARY SYSTEM (NELS): THE SYSTEM IMPACT OF SECURITY
Terry L. McGregor (I-NET, Inc., Bethesda, MD.) Jul. 1993 19 p
(Contract NCC9-16; RICIS Proj. RB-08)
(NASA-CR-194614; NAS 1.26:194614) Avail: CASI HC A03/MF A01

This paper discusses security issues as they relate to the NASA Electronic Library System which is currently in use as the repository system for AdaNET System Version 3 (ASV3) being operated by MountainNET, Inc. NELS was originally designed to provide for public, development, and secure collections and objects. The secure feature for collections and objects was deferred in the initial system for implementation at a later date. The NELS system is now 9 months old and many lessons have been learned about the use and maintenance of library systems. MountainNET has 9 months of experience in operating the system and gathering feedback from the ASV3 user community. The user community has expressed an interest in seeing security features implemented in the current system. The time has come to take another look at the whole issue of security for the NELS system. Two requirements involving security have been put forth by MountainNET for the ASV3 system. The first is to incorporate at the collection level a security scheme to allow restricted access to collections. This should be invisible to end users and be controlled by librarians. The second is to allow inclusion of applications which can be executed only by a controlled group of users; for example, an application which can be executed by librarians only. The requirements provide a broad framework in which to work. These requirements raise more questions than answers. To explore the impact of these requirements a top down approach will be used. DISCONNECTED OPERATION IN A DISTRIBUTED FILE SYSTEM Ph.D. Thesis
James J. Kistler May 1993 268 p
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A266461; CMU-CS-93-156) Avail: CASI HC A12/MF A03

Disconnected operation refers to the ability of a distributed system client to operate despite server inaccessibility by emulating services locally. The capability to operate disconnected is already valuable in many systems, and its importance is growing with two major trends: the increasing scale of distributed systems, and the proliferation of powerful mobile computers. The former makes clients vulnerable to more frequent and less controllable system failures, and the latter introduces an important class of clients which are disconnected frequently and for long durations--often as a matter of choice. This dissertation shows that it is practical to support disconnected operation for a fundamental system service: general purpose file management. It describes the architecture, implementation, and evaluation of disconnected file service in the Coda file system. The architecture is centered on the idea that the disconnected service agent should be one and the same with the client cache manager. The Coda cache manager prepares for disconnection by pre-fetching and hoarding copies of critical files; while disconnected it logs all update activity and otherwise emulates server behavior; upon reconnection it reintegrates by sending its log to the server for replay. This design achieves the goal of high data availability--users can access many of their files while disconnected, but it does not sacrifice the other positive properties of contemporary distributed file systems: scalability, performance, security, and transparency. EXPLOITING WORLD STRUCTURE TO EFFICIENTLY SEARCH FOR OBJECTS
Lambert E. Wixson Nov. 1992 56 p
(Grant NSF IRI-89-03582)
(TR-434) Avail: CASI HC A04/MF A01

This paper studies the task of using a mobile camera platform to search a region of space for a target object. Our goal is to maximize the efficiency of such searches. The problem is analyzed using a simple mathematical description of the factors that affect search efficiency. This analysis suggests that one way to improve efficiency is to take advantage of the spatial relationships in which the target object commonly participates. Searches that do so, which we call indirect searches, are modeled as two-stage processes that first find an intermediate object that commonly participates in a spatial relationship for the target object, and then look for the target in the restricted region specified by this relationship. A mathematical model of search efficiency is then used to analyze the efficiency of indirect search over a wide range of situations that vary the spatial structure of the domain as well as recognition performance. The model predicts that, for searches that involve rotating a camera about a fixed location, indirect searches improve efficiency by factors of 2 to 8. An implemented robot search system substantiates these predictions. Finally, we highlight some areas in need of further research if these efficiencies are to be achieved. Author (revised)

PROCESSING OF RESONANCE PARAMETER COVARIANCE FILES
B. L. Broadhead 1992 16 p Presented at the Nuclear Energy Agency Science Committee (NEANSC) Specialists Meeting on Evaluation and Processing of Covariance Data, Oak Ridge, TN, 7-9 Oct. 1992
(Contract DE-AC05-84OR-21400)
(DE93-015506; CONF-9210173-5) Avail: CASI HC A03/MF A01

The prudent use of resonance parameter covariance information requires the availability of a means of error propagation from the resonance parameters to the cross sections. This work presents an approach to obtaining these so-called resonance parameter sensitivities. The resonance parameter sensitivity methodology developed herein generally provides accurate results when compared to direct recalculations using existing and wellknown cross-section processing codes. However, it has been shown in several cases that self-shielded cross sections can be very nonlinear functions of the basic parameters. For this reason, caution must be used in any study which assumes that a linear relationship exists between a given self-shielded group cross section and its corresponding basic data parameters. The study also has pointed out the need for more approximate techniques which will allow the required sensitivity information to be obtained in a more cost-effective manner. This paper is a synopsis of major work that was completed nearly ten years ago. However, due to the lack of additional development in the field, it remains essentially the current state-of-the-art. (Contract DE-AC05-84OR-21400)
(DE93-015515; CONF-9306177-1) Avail: CASI HC A03/MF A01

This report discusses the concepts and efforts involved in competitively managing an information organization that supports the 20,000 staff members of Martin Marietta Energy Systems, Inc., a government-contracted organization run for the Department of Energy (DOE) by Martin Marietta Corporation. A range of library and records management services to three different plant locations and several off-site locations in Oak Ridge, Tennessee is provided. Library and records management consulting to the plants in Paducah, Kentucky and Portsmouth, Ohio are also provided. A dozen libraries, six records centers, 15 document management centers, a centralized policy management group, and other groups provide customized information analysis and database development services. Subjects supporting business include multidisciplinary basic and applied scientific research and development, manufacturing process support, environmental restoration and waste management, and legislative and management information. These endeavors are supported through 176 regular staff and about 25 subcontracted staff members, who reside in eight major site locations in the Oak Ridge vicinity. DOE

DESIGN AND IMPLEMENTATION OF AN OBJECT-ORIENTED INTERFACE FOR THE MULTI-MODEL/MULTI-LINGUAL DATABASE SYSTEM M.S. Thesis
John W. Moore and Turgay Karlidere Mar. 1993 196 p
(AD-A267413) Avail: CASI HC A09/MF A03

Database designs in today's information-intensive environment, challenge the database-system user to adhere to strict and somewhat archaic means, i.e., traditional data models and their data languages, of expressing their database applications. In light of these requirements, the user must purchase the new database system that supports the latest data model and its data language. We design and implement a comprehensive data-model-and-data-language interface which is a simple and yet effective alternative to the costly and cumbersome standard method of purchasing or developing a new database system. Our solution is two-fold. First, we use the concept of a data-model-and-data-language interface to an existing database system. This not only eliminates the costs associated with building a separate, stand-alone database system to support each new data model and its language, but also allows for resource consolidation and data duplication elimination. Second, using the data-model-and-data-language interface concept, we design and implement an object-oriented-data-model-and-data-language interface for the multimodel/multilingual database system. A GEOLOGICAL AND GEOPHYSICAL INFORMATION SYSTEM FOR EURASIA Semiannual Technical Report No. 3, 30 Oct. 1992 - 30 Apr. 1993
Eric J. Fielding, Muawia Barazangi, and Bryan L. Isacks 29 Jun. 1993 16 p
(Contract F29601-91-K-DB08)
(AD-A267841) Avail: CASI HC A03/MF A01

Topography and heterogeneous crustal structure have major effects on the propagation of regional seismic phases. We are collecting topographical, geological, and geophysical datasets for Eurasia into an information system that can be accessed via Internet connections. Now available are digital topography, satellite imagery, and data on sedimentary basins and crustal structure thicknesses. We are expanding the scope of our information system to include data on the Middle East and North Africa. Under the auspices of several other ongoing projects at Cornell, we have collected a very large literature collection, satellite imagery and some detailed datasets, especially in Syria and Morocco. New datasets for Eurasia include maps of depth to Moho beneath Europe and Scandinavia. We have created regularly spaced grids of the crustal thickness values from these maps that can be used to create profiles of crustal structure. These profiles can be compared by an analyst or an automatic program with the crustal seismic phases received along the propagation path to better understand and predict the path effects on phase amplitudes, a key to estimating magnitudes and yields, and for understanding variations in travel-time delays for phases such as Pn which are important for improving regional event locations. The gridded data could also be used to model propagation of crustal phases in three dimensions. In the near future, we will be making new databases from the Middle East and North Africa available via the Internet. We encourage ARPA and Air Force researchers to contact us about gaining access to our databases. DTIC

CRITICALLY EVALUATED/DISTRIBUTED DATABASE OF IRAS LRS SPECTRA Final Report, 15 Aug. 1990 - 14 Aug. 1993
R. E. Stencel 1993 10 p
(Grant NAG5-1214)
(NASA-CR-193611; NAS 1.26:193611) Avail: CASI HC A02/MF A01

Accomplishments under this grant effort include: successful scientific utilization of the IRAS Low Resolution Spectrometer (LRS) database of over 150,000 scans of 7-23 micron spectra for over 50,000 celestial sources; publication in refereed journal of an additional 486 critically evaluated spectra of sources brighter than 20 Jy, completing the LRS ATLAS (Olnon and Raimond 1986 A&A) uniformly to that level, and production of an additional 1,830 critically evaluated spectra of sources brighter than 10 Jy; creation and maintenance of on-line, remotely accessible LRS spectra of over 7500 sources; cooperation with Astrophysics Data System personnel for transitioning this LRS database to the ADS access system after funding for this project expires; and publication of research highlights, which include a systematic variation of the shapes of LRS silicate features among stars of differing IRAS broad-band colors, maser characteristics and light curve asymmetries, all correlated with the chemical and physical development and processing of solid phase materials, and preliminary evidence for silicate profile variations in individual stars as a function of visual light curve phase. DEFENSE RDT&E ONLINE SYSTEM (DROLS) HANDBOOK Final Report
Barbara Lesser, Christian M. Cupp, Richard J. Wayman, Keith L. Thompson, and Holly J. Wilson Jul. 1993 250 p Supersedes DLAM 4185.4,

dated Sep. 1990 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A267546; DTIC/TR/93-20; DLAM 4185.4) Avail: CASI HC A11

This training handbook provides basic instruction in the use of the Defense RDT and E Online System (DROLS), an automated system providing access to major research and development (R and D) data collections. The Technical Report Database (TR) and Current File Technical Report Database (CF) both address completed R and D work efforts, whereas the Work Unit Database (WU) addresses work in progress. The IR and D Database, representing planned work efforts by Department of Defense (DoD) contractors wholly funded by the DoD. It is intended to be used in conjunction with the DROLS Workbook AD-A259033. DTIC

DESIGN AND IMPLEMENTATION OF AN INTERFACE EDITOR FOR THE AMADEUS MULTI-RELATIONAL DATABASE FRONT-END SYSTEM M.S. Thesis
James P. Hargrove 25 Mar. 1993 286 p
(AD-A267403) Avail: CASI HC A13/MF A03

This thesis extends the Graphical User Interface of a prototype multi-relational database front-end system, called Amadeus. System enhancements are realized through the application of Object-Oriented Programming (OOP) and Human-Computer Interface (HCI) design principles. Knowledge gained from each topic has been incorporated into the design and implementation of a Form-based interface for database data entry and display. The focus of this thesis is divided between two issues: the development of a set of tools for creating and using Form objects; and the design of the Form object itself. Form creation is accomplished using an application program called the Interface Editor module. The Interface Editor is one of six modules which, together, comprise the Amadeus system. Form manipulation occurs in a second application which implements basic program methods for controlling Data entry and display processes. Design and implementation of this thesis was accomplished using the Prograph programming language and development environment, which provided a basic set of system classes essential to the implementation of the Form object and Graphical User Interfaces. DEFENSE LOGISTICS INFORMATION SYSTEM (DLIS). PROCEDURES MANUAL: LOGISTICS ON-LINE ACCESS (LOLA) PROCEDURES MANUAL
Jul. 1992 122 p
(AD-A267685; DOD-4100.39-M) Avail: CASI HC A06/MF A02

This section provides a non-technical presentation of information on the overall system. Detailed technical information, i.e., how to use the Logistics On-Line Access (LOLA) Procedures Application, is presented in other sections of this manual. The LOLA Procedures Application is a component of an automated customer service system provided by the Defense Logistics Services Center (DLSC). LOLA Procedures was designed, developed, and implemented as part of an overall modernization effort at DLSC which was undertaken to address End-User considerations. These considerations include reliability transparency where possible, seamless integration, quick response, single user interface, inter-operability, connectivity, availability, and growth. The LOLA Procedures Application accomplishes these tasks by providing timely responsiveness for customers, increasing reliability and performance, increasing responsiveness to change, and reducing dependence on hardcopy. The Defense Logistics Information System (DLIS) is a centralized, large-scale, fully-integrated, mainframe system. As a part of this System, LOLA Procedures provides the on-line software designed to permit easy access to volumes of information stored in DLSC's databases. LOLA Procedures provides the End-User with user-friendly, help-responsive, interactive screens from which data is requested and then displayed. DTIC

(RTOP 505-90-00)
(NASA-TM-107693; NAS 1.15:107693; Rept-15) Avail: CASI HC A04/MF A01

An exploratory study was conducted that investigated the influence of technical uncertainty and project complexity on information use by U.S. industry-affiliated aerospace engineers and scientists. The study utilized survey research in the form of a self-administered mail questionnaire. U.S. aerospace engineers and scientists on the Society of Automotive Engineers (SAE) mailing list served as the study population. The adjusted response rate was 67 percent. The survey instrument is appendix C to this report. Statistically significant relationships were found to exist between technical uncertainty, project complexity, and information use. Statistically significant relationships were found to exist between technical uncertainty, project complexity, and the use of federally funded aerospace R&D. The results of this investigation are relevant to researchers investigating information-seeking behavior of aerospace engineers. They are also relevant to R&D managers and policy planners concerned with transferring the results of federally funded aerospace R&D to the U.S. aerospace industry. Author

(NASA-TM-107693; NAS 1.15:107693) Avail: CASI HC A04/MF A01

The NASA/DOD Aerospace Knowledge Diffusion Research Project attempts to understand, among other things, the information environment in which U.S. aerospace engineers and scientists work and the factors that influence their use of scientific and technical information (STI). Such an understanding could do the following: (1) lead to the development of practical theory; (2) contribute to the design and development of aerospace information systems; and (3) have practical implications for transferring the results of federally funded aerospace research and development (R&D) to the U.S. aerospace community. In this report, the results of an exploratory study that investigated the influence of two variables--technical uncertainty and project complexity--on the use of information and information sources in completing or solving a project, task, or problem are reported. Several authors have explored relationships among uncertainty, complexity, and information use (Tushman and Nadler; Gifford, Bobbitt, and Slocum; and Randolph). Tushman and Nadler, for example, reported that the more complex the R&D task, the greater the use of STI. Randolph found that the greater the uncertainty associated with the task, the greater the use of STI. These findings, plus the work of Bodensteiner; Holland, Stead, and Leibrock; Atkin; and Kuhlthau, led us to investigate the extent to which the perceived technical uncertainty and complexity of a project, task, or problem affected the use of information and information sources by U.S. aerospace engineers and scientists. The work of Paisley, Wilson, Roberts, Dervin, and Taylor regarding 'information use environments' influenced the conceptual framework, underlying assumptions, and direction of this study. Finally, information on the aerospace information environment and on the information seeking behavior of U.S. aerospace engineers and scientists is included to help establish a context for the study. The study's methodology is described in detail. The variables and their measurement are explained. The study's hypotheses, the data used to test the hypothesis, and a discussion of the results are presented. Author (revised)

DESIGN AND DIAGNOSIS PROBLEM SOLVING WITH MULTIFUNCTIONAL TECHNICAL KNOWLEDGE BASES Final Report, 1 Sep. 1989 - 31 Oct. 1992
B. Chandrasekaran and John Josephson 29 Sep. 1992 226 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-89-C-0110; DARPA Order 6919)
(AD-A268375; AFOSR-93-0575TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The research goal for the project reported here has been to develop enabling technology for building large knowledge bases designed to support automated and semi-automated problem solving for scientific and engineering domains. The work on analyzing problem-solving tasks, much of it preceding the project reported here, has led to the view that there are distinct, analyzable Generic Tasks (GT's) that occur naturally in problem-solving activity. The Functional Representation Language (FR), was originally introduced by Sembugamoorthy and Chandrasekaran as a device representation from which diagnosis specific knowledge could be derived by a process of knowledge compilation. It was subsequently applied to support other tasks besides diagnosis (most notably forms of qualitative simulation), and used to represent a wide variety of device types. DTIC

AUTOMATIC TRANSLATION OF DATABASE INTEGRITY CONSTRAINTS INTO COMPENSATING PRODUCTION RULES
Piero Fraternali 1992 27 p
(Rept-92-055; ETN-93-94567) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

In conventional database systems, consistency is preserved either by forbidding operations that violate integrity constraints or by rolling back transactions that produce inconsistent database states. A third way to integrity maintenance is that of post processing faulty transactions, by introducing system generated compensating actions that lead to a database state which is consistent and as close as possible to that intended by the user. Active databases provide the appropriate technology to implement this paradigm. A framework in which constraints are expressed in a logical language and automatically translated into a set of database rules is introduced. Automatic derivation not only of the triggering conditions of rules but also of the compensating actions is stressed, so that the user is presented with the complete set of actions available to repair constraints violations. This approach ensures that if the execution of the rules triggered by a faulty transaction eventually comes to an end, the final state reached is correct with respect to all the declared constraints. Compile time analysis of termination is then discussed and the features of the run time needed to cope with conflicts among rules enforcing different constraints or the same constraint in several ways are presented. LANGUAGE-BASED DOCUMENT PROCESSING
Dennis S. Arnon (Xerox Corp., Palo Alto, CA.), Isabelle Attali, and Paul Franchi-Zannettacci (Nice Univ., France.) Jul. 1992 21 p
(INRIA-RR-1731; ETN-93-94433) Avail: CASI HC A03/MF A01

An application of programming environments generation to structured documents manipulation is proposed. Centaur is used as a formal tool to model and implement logical and physical structure, logical editing and layout processing, document analysis, re-use and conversion for a sample class of documents: scientific articles including equations and figures. To make connections with real document systems, two particular external forms are given to the logical structure: Tioga source and LATEX source. From the specifications of the logical and physical structures of the Article document class on one hand, and, on the other hand, the specification of the layout processing (viewed as its semantics according to the Tioga or the LATEX layout model) and other semantic tools, the Centaur system automatically generates structured environments for Tioga and LATEX documents and conversions between them. When estimating costs, interval estimates are more informative than simple point estimates. Interval estimates are sometimes available using analytical methods. These methods may be either exact (for example, a sum of random variables) or approximate (for example, based on Taylor series). When analytical methods are not available, simulation may be used instead. This paper illustrates the application of both analytical and simulation methods to the three main types of cost analysis: cost-estimating relationships, work breakdown structures, and stochastic network models. In addition, the paper contains descriptions of some commercially-available software products that can be used to perform simulations for the types of cost-risk analysis described. DTIC

The United States and Australia are among the 20 or more nations of the world having industries currently engaging in some form of space commerce. As a matter of national policy, the United States has encouraged private investment and involvement in space activities since 1984, when the Congress declared it in the best interest of the Nation that NASA '...seek and encourage to the maximum extent possible, the fullest commercial use of space.' Australia's space policy, announced in 1986, has the objective of encouraging greater involvement by industry in space research and development, and the development of commercial space activities. This paper discusses the underlying policies, current status, and prospects for the future of commercial space business activities in the two countries. Author (revised)

TECHNOLOGY TRANSFER. DETERMINING INDUSTRY NEEDS: A GUIDE FOR COMMUNITIES
31 Mar. 1993 28 p Sponsored by NASA. Marshall Space Flight Center
(NASA-CR-194676; NAS 1.26:194676) Avail: CASI HC A01/MF A01

This Guide was developed in accordance with the Memorandum of Understanding between the NASA George C. Marshall Space Flight Center and the following States: Alabama, Georgia, Louisiana, Mississippi, Tennessee, West Virginia. The economic welfare of individual communities is currently a matter of considerable interest. Concern for the position of US industry in the competitive world marketplace is a matter of growing concern as well. This 'guide' describes a process whereby communities may seize the opportunity to improve their own economic destiny. The method described involves linking the technology needs of existing industries to the technologies which are available from Federal Laboratories. Community technology transfer is an 'action possibility' which allows individual citizen groups to do something tangible to improve the economic climate of the places where they live and work. The George C. Marshall Space Flight Center in Huntsville, Alabama is pledged to promote and encourage such efforts, and stands ready to help communities both large and small in that regard. TECHNOLOGY IN ACTION Annual Report
1992 88 p
(NASA-TM-109345; NAS 1.15:109345) Avail: CASI HC A05/MF A01

In keeping with the NASA Administrator's announcement that technology transfer will become a fundamental mission of NASA, the Marshall Space Flight Center (MSFC) has initiated new programs to reach the heartland of U.S. industry. The Center has continued to expand its already well-established outreach program aimed at helping American business, industry, and academia at the grassroots level. The goal is to ensure that America regains and maintains its proper place of leadership among the world's technologically developed nations. MSFC's national goal is to

enhance America's competitiveness in the world marketplace, fortify the value of the dollar, and ensure technological breakthroughs by American laboratories benefit taxpayers and industries. The Technology Utilization (TU) Office at MSFC believes a number of measures are possible to slow, then halt, and ultimately reverse the erosion of American technological leadership. MSFC's TU Office is reaching out to American industry on an increasingly broadening scope, facilitating the transfer of NASA derived technologies to American businesses, industries, educational institutions, and individuals. There are many valid approaches to achieving this goal. Some, such as the National Technology Initiative, begin at the top and work down through America's top corporate structure. Others, such as the technology transfer program that MSFC has implemented, begin at the one-on-one, grassroots level -- working with small and medium-sized firms that form the bulk of American industry. What can be done by one NASA center is, admittedly, limited. But by extrapolating this one-on-one approach to the more than 700 Federal laboratories, a great deal can be accomplished. This report contains an examination of outreach and in reach programs, problem statements programs, applications projects, new technology reporting, new technology administration, and the need for increased resources to further facilitate technology transfer. TOTAL SOLAR ECLIPSE OF 3 NOVEMBER 1994
Fred Espenak and Jay Anderson (Prairie Weather Centre, Winnipeg, Manitoba.) Oct. 1993 69 p
(RTOP 693-00-00)
(NASA-RP-1318; Rept-93B00120; NAS 1.61:1318) Avail: CASI HC A04/MF A01

A total eclipse of the Sun will be visible from the southern half of the Western Hemisphere on 3 November 1994. The path of the Moon's shadow passes through Peru, Chile, Bolivia, Paraguay, and Brazil. Detailed predictions for this event are presented and include tables of geographic coordinates of the path of totality, local circumstances for hundreds of cities, maps of the path of total and partial eclipse, weather prospects, and the lunar limb profile. THE THEORY OF QSO ABSORPTION LINE SYSTEMS AND THEIR RELATIONSHIP TO THE GALAXIES Annual Status Report
Jane Charlton 1 Nov. 1993 3 p
(Grant NAGw-3571)
(NASA-CR-194596; NAS 1.26:194596) Avail: CASI HC A01/MF A01

The fundamental goal of this effort is to paint a picture of what the Ly-alpha forest clouds are and how they are distributed in space. Progress during the first phase of this program involved development of the 'Cheshire Cat Model' of Ly-alpha clouds in which systems over a large range of column densities are produced by disks with somewhat smaller column densities than those of normal galaxies. A prediction of the slab model of Ly-alpha clouds was confirmed by a new observational result, and the comparison of models to the new data allowed an estimate of the pressure of the intergalactic medium. This result should be forthcoming in pre-print form within the next month. The various results will now be described in more detail. Derived from text

ROSAT-IUE OBSERVATIONS OF SYMBIOTIC STARS. THE X RAY MORPHOLOGY OF HIGH LATITUDE ASSOCIATIONS Final Report
Robert E. Stencel 31 Oct. 1993 2 p
(Grant NAG5-1798)
(NASA-CR-194616; NAS 1.26:194616) Avail: CASI HC A01/MF A01

The purposes of this grant included: to provide for continuing investigations of the x-ray properties of a class of interacting binaries known as symbiotic stars through analysis of their detection statistics in the ROSAT All-Sky Survey and simultaneous IUE observations; and to obtain and analyze ROSAT images of selected high latitude OB star associations, in order to permit multi-wavelength dissection of their contents and energetics. The first study is expected to result in enhanced information on mass transfer and accretion in such systems, and provide a more quantitative basis for interpretation of the spectra of these and similar stellar and extragalactic systems. This particular effort represents NASA support for an approved collaboration between the PI and the ROSAT Team at MPE Garching. In the second study, we seek to correlate the strength with which the diffuse clouds have been shocked and the recent star formation triggered, namely, the O and B stars of the Association, as well as nearby T Tauri stars. The large scale X-ray emission in deep ROSAT PSPC images will be compared with the optical, infrared, and radio topology of nearby supernova remnants, molecular clouds, and the distribution of massive stars in the regions. This should enable us to test whether the star formation triggering shocks originate from in the galactic plane (nearby supernovae) or from the collision of infalling matter with the disk material (galactic fountain dynamics). COMPLEX QSO ABSORBERS: HIGH-REDSHIFT CLUSTERS OF GALAXIES? Final Technical Report
David M. Meyer 9 Nov. 1993 2 p
(Grant NAG5-1779)
(NASA-CR-194617; NAS 1.26:194617) Avail: CASI HC A01/MF A01

Using the PSPC instrument on the ROSAT satellite, we have obtained deep exposures of the fields centered on the QSO's 1556+335, 1037-271, and 0854+191 in an effort to search for extended X-ray emission corresponding to complex QSO absorption-line systems (QALS's) that could be indicative of clusters of galaxies at high redshift. The QSO 1556+335 is known to have a pair of complicated C IV absorption systems at z equals 1.610 (Delta v = 988 km/s) and z equals 1.650 (Delta v = 1677 km/s) near the z equals 1.641 QSO redshift. It has been suggested that the absorption may be due to two rich clusters, one containing the QSO itself. The QSO 0854+191 (z(sub em) = 1.89) has 6 strong C IV absorption systems in 2 close groups at z equals 1.2954, 1.2973,1.3019 and z equals 1.3522, 1.3543, 1.3558. Assuming q(sub O) equals 0.5 and H(sub O) equals 50 km/s Mpc(exp -l), the redshift range of this absorption-line cluster corresponds to a radial distance of 44 Mpc. Interestingly, there is a nearby (approximately 30') QSO (0856+189) with a projected separation of 16 Mpc whose redshift (z = 1.29) is similar to that of the absorbing material toward 0854+191. In the case of 1037-271 (Z(sub em) = 2.18), common QALSs have been observed at z equals I.90, 1.96, 2.02, 2.08, and 2.14 (a radial range of 66 Mpc) in its spectrum and that of its neighbor Tol 1038-272 (Z(sub em) = 2.32) whose 18' separation corresponds to a linear distance of 9 Mpc at z approximately equals 2. The length scales implied by the absorbers toward 0854+191 and 1037-271 are interesting in that they suggest structures more akin to superclusters than clusters. Derived from text

TIP-TILT COMPENSATION: RESOLUTION LIMITS FOR GROUND-BASED TELESCOPES USING LASER GUIDE STAR ADAPTIVE OPTICS
S. S. Olivier, C. E. Max, D. T. Gavel, and J. M. Brase Oct. 1992 52 p Presented at the Laser Guide Star Adaptive Optics Workshop, Albuquerque, NM, 10-12 Mar. 1992
(Contract W-7405-eng-48)
(DE93-016426; UCRL-JC-109219-Rev-2; CONF-9203139-5-Rev-2) Avail: CASI HC A04/MF A01

The angular resolution of long-exposure images from ground-based telescopes equipped with laser guide star adaptive optics systems is fundamentally limited by the the accuracy with which the tip-tilt aberrations introduced by the atmosphere can be corrected. Assuming that a natural star is used as the tilt reference, the residual error due to tilt anisoplanatism can significantly degrade the long-exposure resolution even if the tilt reference star is separated from the object being imaged by a small angle. Given the observed distribution of stars in the sky, the need to find a tilt reference star quite close to the object restricts the fraction of the sky over which long-exposure images with diffraction limited resolution can be obtained. In this paper, the authors present a comprehensive performance analysis of tip-tilt compensation systems that use a natural star as a tilt reference, taking into account properties of the atmosphere and of the Galactic stellar populations and optimizing over the system operating parameters to determine the fundamental limits to the long-exposure resolution. Their results show that for a ten meter telescope on Mauna Kea, if the image of the tilt reference star is uncorrected, about half the sky can be imaged in the V band with long-exposure resolution less than 60 milli-arc-seconds (mas), while if the image of the tilt reference star is fully corrected, about half the sky can be imaged in the V band with long-exposure resolution less than 16 mas. Furthermore, V band images long-exposure resolution of less than 16 mas may be obtained with a ten meter telescope on Mauna Kea for unresolved objects brighter than magnitude 22 that are fully corrected by a laser guide star adaptive optics system. This level of resolution represents about 70% of the diffraction limit of a ten meter telescope in the V band and is more than a factor of 45 better than the median seeing in the V band on Mauna Kea. SOLAR ELECTRO-OPTICAL NETWORK (SEON) UPGRADE/REPLACEMENT PROGRAM. PHASE 1: QUALIFICATION OPERATIONAL TEST AND EVALUATION PLAN Test Report
Stephen D. Fitts and Herman E. Loftin Jun. 1993 84 p
(AD-A266364; AFOTEC-DET1/TP-92-007) Avail: CASI HC A05/MF A01

Detachment 1, Air Force Operational Test and Evaluation Center will conduct a Qualification Operational Test and Evaluation (QOT&E) on the SEON Upgrade/Replacement Program during the fourth quarter of FY 1993 and the first quarter of FY1994 at the Palehua Solar Observatory in Hawaii. The purpose of this QOT&E is to determine the operational suitability and effectiveness of the upgraded SEON so decision makers can decide what changes, if any, need to be made prior to upgrading the other sites. SEON measures solar events to predict their impact on manned space activities and satellite communication, and validates ionospheric disturbances. SEON interfaces with the Air Force Space Forecast Center and the Air Force Global Weather Central. It is comprised of five Solar Observing Optical Networks (SOONs) and four Radio Solar Telescope Networks (RSTNs) longitudinally separated to ensure the sun is constantly monitored. Each SOON is composed of a solar optical telescope (AN/FMQ-7) with automatic solar tracking. Each RSTN is composed of a solar radio telescope (AN/FRR-95) with automatic solar tracking. This equipment also measures the magnitude of solar flares and prepares the necessary solar event messages for release by the operator into the Automated Weather Network. DTIC

WIDE ANGLE, SINGLE SCREEN, GRIDDED SQUARE-LOOP FREQUENCY SELECTIVE SURFACE FOR DIPLEXING TWO CLOSELY SEPARATED FREQUENCY BANDS Patent Application
Te-Kao Wu, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) 15 Jul. 1993 26 p
(Contract NAS7-918)
(NASA-Case-NPO-18664-1-CU; NAS 1.71:NPO-18664-1-CU; US-Patent-Appl-SN-094331) Avail: CASI HC A03/MF A01

The design and performance of a wide angle, single screen, frequency selective surface (FSS) with gridded square-loop path elements are described for diplexing closely separated signal bands, for example, X- and Ku-band signals in an Orbiting Very Long Baseline Interferometer (OVLBI) earth station reflector antenna system, as well as other applications such as military and commercial communications via satellites. Excellent agreement is obtained between the predicted and measured results of this FSS design using the gridded square-loop patch elements sandwiched between 0.0889 cm thick tetrafluoroethylene fluorocarbon polymer (PTFE) slabs. Resonant frequency drift is reduced by 1 GHz with an incident angle from n degrees normal to 40 degrees from normal. NASA

TEST METHODS FOR ACCEPTANCE TESTING OF TELESCOPES
Jul. 1993 40 p
(AD-A268316; RCC-457-93) Avail: CASI HC A03/MF A01

This guide will provide government organizations who are responsible for the procurement of long focal-length optical systems (telescopes) with a general knowledge of what tests can, and generally should, be performed on these systems to ensure compliance with the required specifications. General test procedures are also included. Since test facilities and test equipment available vary considerably among organizations, it is impractical to write a 'cookbook' type of guide to be followed rigorously by all. It is also true that some procured systems may possess special features not generally found in the normal imaging telescope system such as beam splitters, special filters, and reticles. DTIC

A COMPARISON OF CALCULATED AND OBSERVED MONOCHROMATIC TYPE Ia SUPERNOVA LIGHT CURVES
E. Mueller and P. Hoeflich (Technische Univ., Munich, Germany.) Dec. 1992 35 p Submitted for publication

(MPA-709; ETN-93-94916) Copyright Avail: Issuing Activity (Max-Planck-Institut fuer Physik und Astrophysik, Karl-Schwarzschild-Strasse 1, 8046 Garching, Germany)

The calculated monochromatic light curves of a set of type Ia supernova models are compared with the observed monochromatic light curves of 13 type Ia Supernovae (SNIa). The set consists of 11 type Ia supernova models including deflagrations, detonations, delayed detonations, pulsating delayed detonations and tamped detonations. The theoretical light curves were calculated using our recently developed light curve model. The model incorporates a detailed equation of state with an elaborate treatment of the ionization balance, an implicit grey LTE (Local Thermodynamic Equilibrium) radiation transport scheme based on the moment equations, a total energy equation for the gas and the radiation field, expansion opacities, and a Monte Carlo gamma ray deposition scheme. To evolve the structure of the underlying explosion models homologous expansion is assumed. Based on a comparison of theoretical light curves and observational data, the distances of the patent galaxies were determined. It is shown that SNe Ia allow for a measurement of the value of the Hubble constant provided individual fits are used and if they are located at distances larger than 15 Mpc, because only then they are in the 'Hubble' flow. Taking this restriction into account a Hubble constant can be derived within a 2 sigma error. ESA

Classical trajectory calculations of the cross sections for vibrational and rotational energy exchange in direct and reactive collisions of hydrogen atoms and hydrogen molecules have been carried out. To test the sensitivity, three potential energy surfaces have been used. For the exchange transitions which occur at small internuclear distances, the rate coefficients for the three surfaces agree quite well. For the direct transitions, there are significant differences for the pure rotational transitions from j=0 to 2 and from j=1 to j=3 in which there is no change in vibration. For higher j the differences tend to disappear, suggesting that the rotational angular momentum can couple to the orbital angular momentum to overcome the centrifugal barrier. Complete numerically exact quantum mechanical calculations for the process in which vJ changes have been performed. Dr. M. A'Hearn has provided data on the fluorescent population of the NH rotational and fine-structure levels from which we should be able to predict accurate photodissociation lifetimes. The distribution rate of C2 is being investigated. A review of H3(+) in terrestrial and extraterrestrial environments was prepared for a volume of Advances in Atomic, Molecular and Optical Physics.

Avail: CASI HC A03/MF A01

The possibility that strange quark matter (SQM), rather than Fe-56, could be the ground state of hadronic matter has attracted a lot of attention since Witten resurrected the idea in 1984. Stable or metastable SQM can play an important role in cosmology, neutron stars, cosmic ray physics, and relativistic heavy-ion collisions. The following is a brief introduction (with a bias towards Arhus-activities) to the physics and astrophysics of SQM. Further details can be found in the Proceedings of the International Workshop on Strange Quark Matter in Physics and Astrophysics, which was held at Aarhus University from May 20-24, 1991. Part one of this paper deals with the recent finding of the possible existence of a mixed phase of baryon matter and quark matter inside neutron stars. In part two, we review the theoretically determined minimum rotational periods of neutron stars, which serve to distinguish between pulsars that can be understood as rotating neutron stars and those that can not. Likely candidates for the latter are hypothetical strange stars. Their mass-radius relationship is discussed in the last part. It is pointed out that strange stars with a nuclear crust can give rise to the observed phenomena of pulsar glitches, thus passing the only astrophysical test of the strange-matter hypothesis existing to date.

Theoretical and computational studies were carried out on galactic and planetary disks. With the goal of addressing important open questions centered on galactic structure, the cloudy interstellar medium, giant molecular clouds, and star formation in galactic disks and the collisional dynamics of perturbed particulate matter in planetary disks, focus was largely on the self-gravitational effects, dissipative effects, and collisional dynamics of cloud-particle disks. N-body, 'cloud-particle' computational algorithms were developed for the purpose of isolating the role of gaseous self gravity from the roles of other dominant physical mechanisms and dynamical processes, e.g. the collisional dynamics and dissipative processes. The efforts focused largely on galactic disks show that observational constraints provide stringent tests of the numerical simulation techniques developed. Self gravitational effects of the galactic interstellar medium's gas clouds are included by means of Fourier Transform technique. Author (revised)

(NASA-CR-194649; NAS 1.26:194649) Avail: CASI HC A03/MF A01

In this report we will describe the successes and problems encountered in carrying out the above project. Due to funding delays, we were unable to begin the project until February, 1993. The telescopes were ordered in September, 1992. We arranged with the principals of the participating schools, Fruitvale Elementary and Allendale year-Round, to conduct the building and lecture phases of the project during the second and third weeks of February. The principals chose to employ totally different methods of selecting children to participate. Author

THE FORMATION PROCESS OF THE He I LAMBDA 10830 LINE IN COOL GIANT STARS Final Report, 1 Jul. 1991 - 30 Jun. 1993
Donald G. Luttermoser 29 Oct. 1993 12 p Submitted for publication
(Grant NAG5-1655)
(NASA-CR-194648; NAS 1.26:194648) Avail: CASI HC A03/MF A01

The Final Report on the formation process of the He I lambda 10830 line in cool giant stars is presented. The research involves observing a sample of cool giant stars with ROSAT. These stars were selected from the list of bright stars which display He I lambda 10830 in absorption or emission and lie on the cool side of the coronal dividing line. With measured x ray fluxes or upper limits measured by the Position Sensitive Proportional Counter (PSPC), the role x rays play in the formation of this important line was investigated using the non-LTE radiative transfer code PANDORA. Hydrodynamic calculations were performed to investigate the contributions of acoustic wave heating in the formation of this line as well.

VARIABILITY OF THE SEYFERT GALAXY MKN 766 IN THE ROSAT ALL SKY SURVEY
Silvano Molendi, Tommaso Maccacaro (Osservatorio Astronomico, Brera, Milan, Italy.), and Stefan Schaeidt 19 Oct. 1992 22 p Submitted for publication Sponsored by Max-Planck-Inst. fuer Physik und Astrophysik, Garching, Germany, and Italian Space Agency, Rome, Italy

Results from the Rosat All Sky Survey (RASS) observation of the Seyfert galaxy MKN 766 are presented. Using a technique developed for the analysis of point sources in the RASS it is shown that MKN 766 is highly variable. Comparison of the soft X-ray spectrum with Exosat medium energy archive data shows that the spectrum of MKN 766 is characterized by a strong soft excess. The low energy resolution of the Position Sensitive Proportional Counter (PSPC) instrument on board the Rosat spacecraft does not allow discrimination between different spectral models for the soft access. Both a power law or a thermal component yield an acceptable fit. Of the two thermal models only the first can be accepted since the best fitting parameters derived for the latter are not consistent with bremsstrahlung emission. A comparison with theoretical models for the soft excess is presented. The lack of a strong bump rules out models in which soft X-ray are produced by Comptonizing ultraviolet photons. The soft excess in the spectrum of MKN 766 can be fitted with the emission spectrum from an accretion disk. The accretion disk parameters derived from the fit, the mass, and the accretion rate are consistent with those found by comparing the two variability timescales observed in the lightcurve to two fundamental timescales operating in the disk. Spinning particles in curved space time can have fermionic symmetries generated by the square root of bosonic constants of motion other than the Hamiltonian. A general analysis of the conditions under which such new supersymmetries appear is presented. The Poisson-Dirac algebra of the resulting set of charges, including the conditions of closure of the new algebra are discussed. An example of a new nontrivial supersymmetry is found in black hole solutions of the Kerr-Newmann type and corresponds to the Killing-Yano tensor, which plays an important role in solving the Dirac equation in these black hole metrics. RELATIVISTIC DYNAMICS OF SPIN IN STRONG EXTERNAL FIELDS
J. W. vanHolten 1993 12 p Presented at 4th Hellenic School on Elementary Particle Physics, Corfu, Italy, Sep. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(NIKHEF-H/93-06; ETN-93-94827) Avail: Issuing Activity (European Space Agency (ESA))

The dynamics of relativistic spinning particles in strong external electromagnetic or gravitational fields is discussed. The purpose is to present some examples of this dynamical phenomenon which satisfy the equations of motion of the type proposed by other authors for motion in an electromagnetic field, or a generalization of these equations to motion in gravitational fields. Spin-orbit is shown to affect such relativistic phenomena as time dilation and perihelion shift. Possible applications include muon decay in a magnetic field and the dynamics of neutrion stars in binary systems. ESA

(Max-Planck-Institut fuer Physik und Astrophysik, Karl-Schwarzschild-Strasse 1, 8046 Garching, Germany)

Some of the problems related to the evaluation of binding energies (masses) and weak interaction rates in nuclei of astrophysical interest are discussed. Selected examples of those arising in stellar evolution and nucleosynthesis studies are considered. Judging from the progress made in developing new experiment techniques, it can be expected that some data in the quest will become available in the near future. This concerns masses and beta decay half lives of neutron rich nuclei involved in the r-process nucleosynthesis ESA

ASTROPHYSICS WITH MILAGRO
1993 4 p Presented at the International Cosmic-Ray Conference, Calgary, Alberta, 19-20 Jul. 1993
(Contract W-7405-eng-36)
(DE93-012722; LA-UR-93-1603; CONF-930779-1) Avail: CASI HC A01/MF A01

This paper describes how data from a new type of air shower detector, MILAGRO, can shed light on a variety of interesting problems in astrophysics. MILAGRO has the capability to make observations of VHE/UHE emission from the recently discovered TeV gamma-ray source Markarian 421, an

Active Galactic Nucleus (AGN). An observation of the attenuation of this signal in the range of 1-20 TeV can be used to make the first measurement of the intergalactic infrared radiation. We also describe how MILAGRO can improve the existing limits on the density of Primordial Black Holes (PBH) by three orders of magnitude. Finally, we discuss how this instrument can be used to measure the diffuse galactic emission of gamma-rays which must come from the disk. DOE

A GLOBAL TRAVELING WAVE ON VENUS Final Report
Michael D. Smith, Peter J. Gierasch, and Paul J. Schinder 16 Sep. 1993 88 p
(Grant NAG2-680)
(NASA-CR-194356; NAS 1.26:194356) Avail: CASI HC A05/MF A01

The dominant large-scale pattern in the clouds of Venus has been described as a 'Y' or 'Psi' and tentatively identified by earlier workers as a Kelvin wave. A detailed calculation of linear wave modes in the Venus atmosphere verifies this identification. Cloud feedback by infrared heating fluctuations is a plausible excitation mechanism. Modulation of the large-scale pattern by the wave is a possible explanation for the Y. Momentum transfer by the wave could contribute to sustaining the general circulation.

VOYAGER ENCOUNTER HIGHLIGHTS (Videotape)
28 Jun. 1989 Videotape: 30 min. 18 sec. playing time, in color, with sound
(NASA-TM-109420; NONP-VT-93-190217) Avail: CASI VHS A01/BETA A22

The following are presented: computer animation of trajectories for both Voyagers 1 and 2; view of Jupiter during one orbit of Ganymede; computer animation of Voyager 2's encounter with Jupiter and its satellites; time lapse of the planet's rotation and its satellites; stroboscopic sequence of selected frames; cloud motion; Jupiter's Great Red Spot (4/25 - 5/24, 1979) through a violet filter; and the Great Red Spot through a blue filter by Voyager 1. The dynamics of Jupiter's clouds are shown - the whole planet is shown first, then two closer looks are repeated several times. Also included are pans of stills of Jupiter's satellites and a computer simulation tour of Saturn system from POV just behind Voyager, made of 116 images of Saturn through a green filter and of 516 images taken by Voyager 1 (9/12 - 9/14, 1980). Frames are enhanced to show the motion of features in Saturn's rings. Pans of stills of Saturn's satellites are shown. There is computer animation of the planet's system, rings, and Sigma Sagittari. Images on January 14, 1986 are through an orange filter. Uranus's satellites are shown as is computer animation of an August 1989 encounter.

NEPTUNE ENCOUNTER HIGHLIGHTS (Videotape)
28 Nov. 1989 Videotape: 32 min. 38 sec. playing time, in color, with sound
(NASA-TM-109421; NONP-VT-93-190218) Avail: CASI VHS A01/BETA A22

Voyager encounter data are presented in computer animation (CA) and real (R) animation. The highlights include a view of 2 full rotations of Neptune. It shows spacecraft trajectory 'diving' over Neptune and intercepting Triton's orbit, depicting radiation and occulation zones. Also shown are a renegade orbit of Triton and Voyager's encounter with Neptune's Magnetopause. A model of the spacecraft's complex maneuvers during close encounters of Neptune and Triton is presented. A view from Earth of Neptune's occulation experiment is is shown as well as a recreation of Voyager's final pass. There is detail of Voyager's Image Compensation technique which produces Voyager images. Eighteen images were produced on June 22 - 23, 1989, from 57 million miles away. A 68 day sequence which provides a stroboscopic view - colorization approximates what is seen by the human eye. Real time images recorded live from Voyager on 8/24/89 are presented. Photoclinometry produced the topography of Triton. Three images are used to create a sequence of Neptune's rings. The globe of Neptune and 2 views of the south pole are shown as well as Neptune rotating. The rotation of a scooter is frozen in images showing differential motion. There is a view of rotation of the Great Dark Spot about its own axis. Photoclinometry provides a 3-dimensional perspective

using a color mosaic of Triton images. The globe is used to indicate the orientation of Neptune's crescent. The east and west plumes on Triton are shown. CASI

Avail: CASI HC A01/MF A06

Most compositional characterizations of the minor planets are derived from analysis of visible and near-infrared reflectance spectra. However, such spectra are derived from light which has only interacted with a very thin surface layer. Although regolith processes are assumed to mix all near-surface lithologic units into this layer, it has been proposed that space weathering processes can alter this surface layer to obscure the spectral signature of the bedrock lithology. It has been proposed that these spectral alteration processes are much less pronounced on asteroid surfaces than on the lunar surface, but the possibility of major spectral alteration of asteroidal optical surfaces has been invoked to reconcile S-asteroids with ordinary chondrites. The reflectance spectra of a large subset of the S-asteroid population have been analyzed in a systematic investigation of the mineralogical diversity within the S-class. In this sample, absorption band depth is a strong function of asteroid diameter. The S-asteroid band depths are relatively constant for objects larger than 100 km and increase linearly by factor of two toward smaller sizes (approximately 40 km). Although the S-asteroid surface materials includes a diverse variety

of silicate assemblages, ranging from dunites to basalts, all compositional subtypes of the S-asteroids conform to this trend. The A-, R-, and V-type asteroids which are primarily silicate assemblages (as opposed to the metal-silicate mixtures of most S-asteroids) follow a parallel but displaced trend. Some sort of textural or regolith equilibrium appears to have been attained in the optical surfaces of asteroids larger than about 100 km diameter but not on bodies below this size. The relationships between absorption band depth, spectral slope, surface albedo and body size provide an intriguing insight into the nature of the optical surfaces of the S-asteroids and space weathering on these objects. THE Fe2(+)-Mg INTERDIFFUSION IN ORTHOPYROXENE: CONSTRAINTS FROM CATION ORDERING AND STRUCTURAL DATA AND IMPLICATIONS FOR COOLING RATES OF METEORITES Abstract Only **c90**

J. Ganguly and V. Tazzoli (Pavia Univ., Italy.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 517-518 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Orthopyroxene crystals in a number of meteorites exhibit compositional zoning of Fe and Mg, which provide important constraint on their cooling rates. However, attempts to model cooling rate of these crystals from Fe-Mg zoning profiles suffer from the lack of any measured or theoretically well constrained Fe-Mg interdiffusion data in OP(x) It has been assumed that Fe-Mg interdiffusion in OP(x) only slightly slower than that in olivine. The purpose of this paper is to (1) calculate the Fe-Mg fractionation, and (2) provide analytical formulation relating cooling rate to the length of the diffusion zone across the interface of the overgrowth of a mineral on itself with application to Mg diffusion profile across OP(x) growth on OP(x) in certain mesosiderites. CATION ORDERING IN ORTHOPYROXENES AND COOLING RATES OF METEORITES: LOW TEMPERATURE COOLING RATES OF ESTHERVILLE, BONDOC AND SHAW Abstract Only **c90**

J. Ganguly, H. Yang (Washington Univ., Seattle.), and S. Ghose (Washington Univ., Seattle.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 519-520 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The cooling rates of meteorites provide important constraints on the size of their parent bodies, and their accretionary and evolutionary histories. However, the cooling rates obtained so far from the commonly used metallographic, radiometric and fission-track methods have been sometimes quite controversial, such as in the case of the mesosiderites and the meteorite Shaw. We have undertaken a systematic study of the cooling rates of meteorites using a different approach, which involves single crystal x-ray determination of Fe(2+)-Mg ordering in orthopyroxenes (OP(x)) in meteorites, subject to bulk compositional constraints, and numerical simulation of the evolution of the ordering state as a function of cooling rate, within the framework of the thermodynamic and kinetic principles governing cation ordering. We report the results obtained for OP(x) crystals from Shaw and two mesosiderites, Estherville and Bondoc.

THE SCR Ne-21 AND Ar-38 IN LUNAR ROCK 68815: THE SOLAR PROTON ENERGY SPECTRUM OVER THE PAST 2 MYR Abstract Only

D. H. Garrison, M. N. Rao, and D. D. Bogard (Los Alamos National Lab., NM.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 521-522 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

We determined concentration profiles of Ne-21, Ne-22, and Ar-38 produced by solar protons as a function of depth in oriented lunar rock 68815. A comparison with model predictions indicate a solar proton flux J(4(pi)(r); E greater than 10 MeV) of 100-125 p/sq. cm/s and a rigidity, R sub 0, of 85-100 MV, assuming an erosion rate of 1-2 mm/Myr. These results for 68815 and similar results on 61016 define the integrated solar proton energy spectrum at the moon over the past approximately 2 Myr.

MORPHOMETRIC COMPARISON OF ICELANDIC LAVA SHIELD VOLCANOES VERSUS SELECTED VENUSIAN EDIFICES Abstract Only

James B. Garvin and Richard S. Williams, Jr. (Geological Survey, Woods Hole, MA.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 523-524 Sponsored by NASA. Washington (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Shield volcanoes are common landforms on the silicate planets of the inner Solar System, and a wide variety have recently been documented on Venus by means of Magellan observations. In this report, we emphasize our recently completed morphometric analysis of three representative Icelandic lava shields: the classic Skjaldbreidur edifice, the low-reflief Lambahraun feature, and the monogenetic Sandfellshaed shield, as the basis for comparison with representative venusian edifices (greater than 60 km in diameter). Our detailed morphometric measurements of a representative and well-studied set of Icelandic volcanoes permits us to make comparisons with our measurements of a reasonable subset of shield-like edifices on Venus on the basis of Magellan global radar altimetry. Our study has been restricted to venusian features larger than approximately 60 km in basal diameter, on the basis of the minimum intrinsic spatial resolution (8 km) of the Magellan radar altimetry data. Finally, in order to examine the implications of landform scaling from terrestrial simple and composite shields to larger venusian varieties, we have considered the morphometry of the subaerial component of Mauna Loa, a type-locality for a composite shield edifice on Earth. A MINERALIZED ZONE IN WESTERN CANDOR CHASMA, MARS Abstract Only

P. E. Geissler, R. B. Singer, and G. Komatsu *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 525-526 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Spectral evidence from Viking and Phobos orbiting spacecraft suggests the local development of crystalline ferric oxides in a small region within Mars' equatorial Valles Marineris canyon system. This is the same area noted for its anomalous coloration in Viking Orbiter image 583 A by McEwen. The unique hue of the region in Viking color data is due to a reduced green filter reflectance, relative to violet and red, in comparison to surrounding materials of similar albedo or average reflectance. For this reason, the region does not appear spectrally distinctive in later Survey Mission images which were acquired without the green filter. In high resolution, the spectral unit can be seen to correspond to two 20 km long depressions on the margins of Candor Mensa, a heavily eroded plateau-forming deposit on the canyon floor. Laminae are conspicuous in several places on the plateau, particularly where 15 to 20 cycles of alternating bright and dark laminae are exposed at approximately 200 meter vertical intervals. Laminae are also visible on the steep, vertically fluted cliffs to the south of this depression. Concentric laminae indicate a basis in the depression on the southeastern margin of Candor Mensa at the location of the less pronounced hue anomaly. A distinct lineation at the base of the scarp at the western end of the canyon transects mottled canyon floor deposits believed to be among the youngest in the Valles marineris. Water is implicated in the formation of the iron oxides, since the steep surfaces of layered sediments elsewhere on Candor Mensa show no evidence of unusual coloration despite the fact that these materials were deposited concurrently with the strata exposed in the depressions. This suggests that the mineralization is secondary in nature and developed locally in association with the depressions, which could have ponded surface runoff or groundwater seepage. Author

TRAPPING OF WATER VAPOR FROM AN ATMOSPHERE BY CONDENSED SILICATE MATTER FORMED BY HIGH-TEMPERATURE PULSE VAPORIZATION Abstract Only

M. V. Gerasimov, Yu. P. Dikov, O. I. Yakovlev, and F. Wlotzka

(Max-Planck-Inst. fuer Chemie, Mainz, Germany.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 527-528 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The origin of planetary atmospheres is thought to be the result of bombardment of a growing planet by massive planetesimals. According to some models, the accumulation of released water vapor and/or carbon dioxide can result in the formation of a dense and hot primordial atmosphere. Among source and sink processes of atmospheric water vapor the formation of hydroxides was considered mainly as rehydration of dehydrated minerals (foresterite and enstatite). From our point of view, the formation of hydroxides is not limited to rehydration. Condensation of small silicate particles in a spreading vapor cloud and their interaction with a wet atmosphere can also result in the origin of hydrated phases which have no genetic connections with initial water bearing minerals. We present results of two experiments of a simulated interaction of condensed silicate matter which originated during vaporization of dry clinopyroxene in a wet helium atmosphere. Author

PARGO CHASMA AND ITS RELATIONSHIP TO GLOBAL TECTONICS Abstract Only
R. C. Ghail *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 529 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Pargo Chasma was first identified on Pioneer Venus data as a 10,000 km long lineation extending from Atla Regio in the north terminating in the plains south of Phoebe Regio. More recent Magellan data have revealed this feature to be one of the longest chains of coronae so far identified on the planet. Stofan et al have identified 60 coronae and 2 related features associated with this chain; other estimates differ according to the classification scheme adopted, for example Head et al. identify only 29 coronae but 43 arachnoids in the same region. This highlights one of the major problems associated with the preliminary mapping of the Magellan data: there has been an emphasis on identifying particular features on Venus without a universally accepted scheme to classify those features. Nevertheless, Pargo Chasma is clearly identified as a major tectonic belt of global significance. Together with the Artemis-Atla-Beta tectonic zone and the Beta-Phoebe rift belt, Pargo Chasma defines a region on Venus with an unusually high concentration of tectonic and volcanic features. Thus, an understanding of the processes involved in the formation of Pargo Chasma may lend significant insight into the evolution of the region and the planet as a whole. I have produced a detailed 1 to 10 million scale map of Pargo Chasma and the surrounding area from preliminary USGS controlled mosaiced image maps of Venus constructed from Magellan data. In view of the problems highlighted above in relation the efforts already made at identifying a particular set of features I have mapped the region purely on the basis of the geomorphology visible in the magellan data without any attempt at identifying a particular set or class of features. Thus, the map produced distinguishes between areas of different brightness and texture. This has the advantage of highlighting the tectonic fabric of Pargo Chasma and clearly illustrates the close inter-relationship between individual coronae and the surrounding tectonic belts. Author

Keller (National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, TX.) et al *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 531-532 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The Carbotek/Shimizu process to produce oxygen from lunar soils has been successfully demonstrated on actual lunar samples in laboratory facilities at Carbotek with Shimizu funding and support. Apollo sample 70035 containing approximately 25 percent ilmenite ($FeTiO_3$) was used in seven separate reactions with hydrogen varying temperature and pressure: $FeTiO_3 + H_2$ yields $Fe + TiO_2 + H_2O$. The experiments gave extremely encouraging results as all ilmenite was reduced in every experiment. The lunar ilmenite was found to be about twice as reactive as terrestrial ilmenite samples. Analytical techniques of the lunar and terrestrial ilmenite experiments performed by NASA Johnson Space Center include iron Mossbauer spectroscopy (FeMS), optical microscopy, SEM, TEM, and XRD. The Energy and Environmental Research Center at the University of North Dakota performed three SEM techniques (point count method, morphology determination, elemental mapping), XRD, and optical microscopy. THE FORMATION AND EVOLUTION OF ALPHA AND TELLUS TESSERAE ON VENUS Abstract Only
M. S. Gilmore and J. W. Head *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 533-534 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Although tesserae comprise at approximately 10 percent of the surface of Venus, the nature of their formation and evolution is not well understood. One important clue to elucidate this problem is tessera boundaries which are of two types: type 1 are generally embayed by plains; type 2 boundaries are characterized by being linear at the hundred kilometer scale and often associated with steep scarps or tectonic features. Previous study of a distinctive type 2 boundary at Alpha Regio was pursued in order to characterize and assess the implications for this style in general. A model of gravitational relaxation of the tessera block was presented to explain the specific style of type 2 feature seen at western Alpha; however, this model cannot account for the full range of interior structures of Alpha, namely widespread compressional features overprinted by extensional features and volcanism. In order to explain the features of Alpha, we have considered a three-stage model involving (1) mantle downwelling and compression of the lithosphere, (2) delamination of the thickened tessera root, and (3) gravitational relaxation and extension of the tessera plateau. We compare this to the characteristics of Tellus Regio in order to test its broader application. Derived from text

EXTRACTION AND ISOTOPIC ANALYSIS OF MEDIUM MOLECULAR WEIGHT HYDROCARBONS FROM MURCHISON USING SUPERCRITICAL CARBON DIOXIDE Abstract Only **c90**
Iain Gilmour and Colin Pillinger *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 535-536 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The large variety of organic compounds present in carbonaceous chondrites poses particular problems in their analysis not the least of which is terrestrial contamination. Conventional analytical approaches employ simple chromatographic techniques to fractionate the extractable compounds into broad classes of similar chemical structure. However, the use of organic solvents and their subsequent removal by evaporation results in the depletion or loss of semi-volatile compounds as well as requiring considerable preparative work to assure solvent purity. Supercritical fluids have been shown to provide a powerful alternative to conventional liquid organic solvents used for analytical extractions. A sample of Murchison from the Field Museum was analyzed. Two interior fragments were used; the first (2.85 g) was crushed in an agate pestel and mortar to a grain size of ca. 50-100 micron, the second (1.80 g) was broken into chips 3-8 mm in size. Each sample was loaded into a stainless steel bomb and placed in the extraction chamber of an Isco supercritical fluid extractor maintained at 35 C. High purity (99.9995 percent) carbon dioxide was used and was pressurized using an Isco syringe pump. The samples were extracted dynamically by flowing CO_2 under pressure through the bomb and venting via a 50 micron fused filica capillary into 5 mls of hexane used as a collection solvent. The hexane was maintained at a temperature of 0.5 C. A series of extractions were done on each sample using CO_2 of increasing density. The principal components extracted in each fraction are summarized. Author

CRETACEOUS-TERTIARY BOUNDARY SPHERULES AND CENOZOIC MICROTEKTITES: SIMILARITIES AND DIFFERENCES Abstract Only **c90**

B. P. Glass, Bruce F. Bohor (Geological Survey, Denver, CO.), and William J. Betterton (Geological Survey, Denver, CO.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 539-540 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Bohor and Betterton pointed out that the K-T spherules can be divided into three groups. Their Type 1 spherules appear to be found in or adjacent to North America, particularly the Western Interior and in Haiti and Mexico. The Type 1 spherules occur in the lower part of the K-T boundary clay below an Ir anomaly. It is the Type 1 spherules which are most similar to microtektites. The discovery of K-T boundary spherules in Beloc, Haiti, and Mimbral, Mexico, with residual tektite-like glass cores supports the hypothesis that the Type 1 spherules are diagenetically altered microtektites. The similarities and differences of the Type 1 K-T boundary spherules to previously described Cenozoic microtektites are discussed. Author

A TEST OF THE APPLICABILITY OF INDEPENDENT SCATTERING TO HIGH ALBEDO PLANETARY REGOLITHS Abstract Only

J. D. Goguen *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 541-542 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

We show that 'independent scattering' is a useful approximation for high albedo particles whose size and packing density are similar to typical particles in the lunar regolith. Laboratory measurements of the intensity and linear polarization of light scattered from a laboratory sample of glass spheres of know size and composition are compared to radiative transfer calculations of the same observable quantities. Mie scattering is integrated over the size distribution of the particles to determine the mean phase and polarization functions, or phase matrix, of the particle. Assuming that the particles scatter independently, the 'doubling method' is used to rigorously calculate multiple scattering in an optically thick layer of these anisotropically scattering particles. All of the major features 'predicted' in the calculated intensity (double peaks at small phase angles) and polarization (negative branch at small phase angles, large positive peak near 20 degrees phase, and small polarization elsewhere) are observed in the laboratory measurements, with good quantitative agreement indicated at phase angles less than 90 degrees. Even though the particles are supported by physical contact with each other in the sample, as are the particles in planetary regoliths, the independent scattering calculation yields a good approximation to both the intensity and polarization. The physical parameters input to the calculation are only the size distribution of the particles and their complex index of refraction (composition). Significant advantages of this approach are that the phase matrix is calculated from basic physical principles and both the intensity and polarization are determined simultaneously. This model may have broad applications to the interpretation of photometry, spectroscopy, and polarimetry of the icy regoliths of high albedo satellites. The intent of this effort is to perform a controlled experiment that tests the utility of the independent scattering assumption Author

RHEOLOGY OF WATER AND AMMONIA-WATER ICES Abstract Only **c25**

D. L. Goldsby, D. L. Kohlstedt, and W. B. Durham (Lawrence Livermore National Lab., CA.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 543-544 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Creep experiments on fine-grained water and ammonia-water ices have been performed at one atmosphere and high confining pressure in order to develop constitutive relationships necessary to model tectonic processes and interpret surface features of icy moons of the outer solar system. The present series of experiments explores the effects of temperature, strain rate, grain size, and melt fraction on creep strength. In general, creep strength decreases with increasing temperature, decreasing strain rate, and increasing melt fraction. A transition from dislocation creep to diffusion creep occurs at finer grain sizes, higher temperatures, and lower strain rates. Author

IMPORTANCE OF EXPANSION AND CONTRACTION IN THE FORMATION OF TECTONIC FEATURES ON THE MOON Abstract Only

M. P. Golombek and W. B. Banerdt *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 545-546 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The lack of globally distributed tectonic features on the lunar surface has been used to argue against significant changes in the radius of the Moon since the formation of the presently observed surface, which dates to the end of heavy bombardment about 3.9 Ga. This observation has been used previously to limit the maximum stresses to approximately 100 MPa that could be supported by the lunar lithosphere without the formation of globally distributed tectonic features, which in turn limits the maximum radius changes to plus or minus 1 km for a purely elastic lithosphere. In a previous abstract, limits on the elastic expansion or contraction of the Moon were reexamined with respect to realistic failure stresses necessary to produce actual lunar tectonic features. In addition, limits on the permanent (plastic) strain that could be accommodated by non-mascon grabens and wrinkle ridges were considered with more severe constraints placed on the total reasonable expansion and contraction of the Moon since 3.9 Ga. In this abstract, considerations of the distribution and mechanisms of formation due to a planetary radius change or their accommodating much permanent plastic planetary expansion or contraction. STALKING THE LREE-ENRICHED COMPONENT IN UREILITES Abstract Only **c90**

Cyrena Anne Goodrich and Guenter W. Lugmair (Scripps Institution of Oceanography, San Diego, CA.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 547-548 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Ureilites contain a LREE-enriched component whose origin and identity are unknown, but which may have been introduced into 4.55 Ga olivine + pyroxene assemblages at various times in the period 4.55 - 3.74 Ga. This component is volumetrically minor, inhomogeneously distributed, and can be removed with concentrated HNO3, which suggests that it may be contained in minor, interstitial phases not previously recognized in ureilites. There is evidence, however, that not all of this component is leachable. Whole rock samples of Kenna, Novo Urei, and ALHA77257 form a Nd-143/Nd-144-Sm-147/Nd-144 line with a slope corresponding to an age of 3.74 Ga. Although this line could be a mixing line, with one end-member being the LREE-enriched component and the other being a 4.55 Ga olivine + pyroxene assemblage, the observation that a pyroxene separate from Kenna plots on the line suggests that the LREE-enriched component at least partially equilibrated with the olivine and pyroxene and that the line is an isochron. We performed a leaching experiment on Kenna, using various acids and concentrations, in an attempt to isolate the LREE-enriched component and differentiate between possible hosts for it, and to determine whether all of it is leachable. Our results suggest that most of the LREE-enriched component is surface-sited, rather than contained in a

discrete mineral. However, some of it is not readily leachable because it equilibrated with Kenna olivine + pyroxene at 3.79 plus or minus 0.05 Ga. Author

GROSNAJA ABCs: MAGNESIUM ISOTOPE COMPOSITIONS Abstract Only **c90**
J. N. Goswami, G. Srinivasan, and A. A. Ulyanov (Moscow State Univ., Russia.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 549-550 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Three CAI's from the Grosnaja CV3 chondrite were analyzed for their magnesium isotopic compositions by the ion microprobe. The selected CAI's represent three distinct types: GR4(compact Type A), GR7(Type B) and GR2(Type C). Petrographic studies indicate that all three Grosnaja inclusions were subjected to secondary alterations. The Type A CAI GR4 is primarily composed of melilite with spinel and pyroxene occurring as minor phases. The rim of the inclusion does not exhibit distinct layered structure and secondary alteration products (garnet, Fe-rich olivine and Na-rich plagioclase) are present in some localized areas near the rim region. The average major element compositions of different mineral phases in GR4 are given. Preliminary REE data suggest a depletion of HREE relative to LREE by about a factor of 3 without any clear indication of interelement fractionation. The CAI GR7 has textural and minerological characteristics similar to Type B inclusions. The REE data show a pattern that is similar to Group 6 with enrichment in Eu and Yb. In addition, a depletion of HREE compared to LREE is also evident in this object. Melilite composition shows a broad range of akermanite content (Ak(sub 15-55)). Detailed petrographic study is in progress. GR2 is a anorthite-rich Type C inclusion with large plagioclase laths intergrown with Ti-rich pyroxene. The average plagioclase composition is close to pure anorthite (An99). Author

EUROMET UREILITE CONSORTIUM: A PRELIMINARY REPORT ON CARBON AND NITROGEN GEOCHEMISTRY Abstract Only **c90**
Monica M. Grady and C. T. Pillinger (Open Univ., Milton, England.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 551-552 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The first Euromet expedition to the Frontier Mountain in Antarctica in December 1990 recovered two ureilites, FRO 90036 (34.6g) and FRO 90054 (17.5g). Preliminary classification indicated that the specimens had very different textures and mineral chemistries, and hence were not paired. A third ureilite, Acfer 277 (41.0 g), has also recently been returned from the Sahara. Due to the small sample sizes of the meteorites, and the unusual mineralogy of FRO 90054, a consortium was established to ensure the most effective study of these samples; this abstract reports on the carbon and nitrogen stable isotope geochemistry of two of the three ureilites issued to the consortium. NITRATES IN SNCs: IMPLICATIONS FOR THE NITROGEN CYCLE ON MARS Abstract Only
Monica M. Grady, I. P. Wright (Open Univ., Milton, England.), I. A. Franchi (Open Univ., Milton, England.), and C. T. Pillinger (Open Univ., Milton, England.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 553-554 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Nitrogen is the second most abundant constituent of the Martian atmosphere, after CO2, present at a level of ca. 2.7 percent. Several authors have hypothesized that earlier in the planet's history, nitrogen was more abundant, but has been removed by processes such as exospheric loss from the atmosphere. However, an alternative sink for atmospheric nitrogen is the regolith; model calculations have predicted that, via the formation of NOx, HNO2 and HNO3 in the lower layers of the Martian atmosphere, the regolith might trap nitrite and nitrate anions, leading to the build-up of involatile nitrates. Integrated over 4.5 x 10(exp 9) yr, such a mechanism would contribute the equivalent of a layer of nitrates up to 0.3 cm thick distributed across the Martian surface. Features in thermal emission spectra of the surface of Mars have been interpreted tentatively as emanating from various anions (carbonates, bicarbonates, sulphates, etc.), and the presence of nitrates has also been addressed as a possibility. The identification of carbonates in SCN meteorites has allowed inferences to be drawn concerning the composition and evolution of the Martian atmosphere in terms of its carbon isotope systematics; if nitrites, nitrates, or other nitrogen-bearing salts could be isolated from SNC's, similar conclusions might be possible for an analogous nitrogen cycle. Nitrates are unstable, being readily soluble in water, and decomposed at temperatures between 50 C and 600 C, depending on composition. Any nitrates present in SNC's might be removed during ejection from the planet's surface, passage to Earth, or during the sample's terrestrial history, by weathering etc. The same might have been said for carbonates, but pockets of shock-produced glass (lithology C) from within the EET A79001 shergottite and bulk samples of other SNC contain this mineral, which did apparently survive. Nitrates occurring within the glassy melt pockets of lithology C in EET A79001 might likewise be protected. Lithology C glass was therefore selected for nitrate analysis, first by non-destructive infra red spectroscopy, and then by stepped combustion. Author

NEW K TYPE ASTEROIDS Abstract Only **c90**
James C. Granahan, Greg Smith, and Jeffrey F. Bell *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 557-558 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Several new K type asteroids were identified during near infrared spectral observations on July 30, 1992 at NASA's infrared telescope facility (IRTF) at Mauna Kea, Hawaii. These K asteroids are 513 Centesima, 633 Zelima, 1129 Neujmina, 1416 Renauxa, 1799 Koussevitzky, and 1883 Rauma. A K asteroid is an asteroid which possesses a S type spectra in visible wavelengths and a C type spectra visible in near-infrared wavelengths. These objects are usually misclassified as S asteroids on the basis of visible spectra alone. This type was first detected by the 52 infrared color asteroid survey also conducted at the IRTF. Our observations utilized a new seven color infrared asteroid filter system which allows near-infrared data to be collected from asteroids as faint as 16th 5 magnitude. Author

MARTIAN CRATER DEGRADATION BY EOLIAN PROCESSES: ANALOGY WITH THE RIO CUARTO CRATER FIELD, ARGENTINA Abstract Only
J. A. Grant and P. H. Schultz *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 559-560 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Numerous degraded and rimless craters occur across broad areas of the Martian surface that are mantled by thick, unconformable deposits. These regions include Arabia, Mesogaea, Electris, Tempe, the interior and surface to the northwest of Isidis Basin, southern Ismenius Lacus, and the polar layered terrains. Occurrence of the deposits and low regional thermal inertias indicate that at least some accumulated fine-grained sediment (effective particle diameters of 0.1-0.5 mm or coarse silt to medium sand) to a thickness of 100's to 1000's of meters. Most unconformable deposits

experienced some eolian modification that may be recent in some locales. Despite the presence of these deposits, simple eolian deposition appears incapable of creating the numerous degraded and rimless craters occurring within their limits. Nevertheless, terrestrial analyses of the Rio Cuario craters formed into loessoid deposits demonstrates that eolian redistribution of fine-grained sediment in and around craters produces degraded morphologies that are analogous to some found in mantled regions on Mars.

ROVER MOUNTED GROUND PENETRATING RADAR AS A TOOL FOR INVESTIGATING THE NEAR-SURFACE OF MARS AND BEYONG

Abstract Only **c32**

J. A. Grant and P. H. Schultz *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 561-562 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

In spite of the highly successful nature of recent planetary missions to the terrestrial planets and outer satellites a number of questions concerning the evolution of their surfaces remain unresolved. For example, knowledge of many characteristics of the stratigraphy and soils comprising the near-surface on Mars remains largely unknown, but is crucial in order to accurately define the history of surface processes and near-surface sedimentary record. Similar statements can be made regarding our understanding of near-surface stratigraphy and processes on other extraterrestrial planetary bodies. Ground penetrating radar (GPR) is a proven and standard instrument capable of imaging the subsurface at high resolution to 10's of meters depth in a variety of terrestrial environments. Moreover, GPR is portable and easily modified for rover deployment. Data collected with a rover mounted GPR could resolve a number of issues related to planetary surface evolution by defining shallow stratigraphic records and would provide context for interpreting results of other surface analyses (e.g. elemental or mineralogical). A discussion of existing GPR capabilities is followed first by examples of how GPR might be used to better define surface evolution on Mars and then by a brief description of possible GPR applications to the Moon and other planetary surfaces. SAND TRANSPORT ON MARS: PRELIMINARY RESULTS FROM MODELS Abstract Only

R. Greeley, F. S. Anderson, D. Blumberg, E. Lo, P. Xu, and J. Pollack (National Aeronautics and Space Administration. Ames Research Center, Moffett Field, CA.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 563-564 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Most studies of active aeolian processes on Mars have focused on dust, i.e., particles approximately 1 micron in diameter that are transported in suspension by wind. The presence of sand dunes on Mars indicates that larger grains (approximately greater than 60 microns, transported primarily in saltation) are also present. Although indirect evidence suggests that some dunes may be active, definitive evidence is lacking. Nonetheless, numerous studies demonstrate that sand is substantially easier to transport by wind than dust, and it is reasonable to infer that sand transportation in saltation occurs under present Martian conditions. In order to assess potential source regions, transportation pathways, and sites of deposition for sand on Mars, an iterative sand transport algorithm was developed that is based on the Mars General Circulation Model of Pollack et al. The results of the dust transport model are then compared with observed surface features, such as dune field locations observed on images, and surficial deposits as inferred from Viking IRTM observations. Preliminary results suggest that the north polar dune fields in the vicinity of 270 degrees W, 70 degrees N originated from weathered polar layered plains centered at 280 degrees W, 85 degrees N, and that Thaumasia Fossae, southern Hellas Planitia, and the area west of Hellespontus Montes are sand depositional sites. Examples of transportation 'corridors' include a westward pathway in the latitudinal band 35 degrees N to 45 degrees N, and a pathway southward from Solis Planum to Thaumasia Fossae, among others. GALILEO IMAGING RESULTS FROM THE SECOND EARTH-MOON FLYBY: LUNAR MARIA AND RELATED UNITS

R. Greeley, M. J. S. Belton (Kitt Peak National Observatory, Tucson, AZ.), J. W. Head (Brown Univ., Providence, RI.), A. S. McEwen (Geological Survey, Flagstaff, AZ.), C. M. Pieters (Brown Univ., Providence, RI.), G. Neukum (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Oberpfaffenhofen, Germany.), T. L. Becker (Geological Survey, Flagstaff, AZ.), E. M. Fischer (Brown Univ., Providence, RI.), S. D. Kadel, and M. S. Robinson (Hawaii Univ., Honolulu.) et al *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 565-566 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The second flyby of the Earth-Moon System by Galileo occurred on December 7, 1992, on its trajectory toward Jupiter. The flyby took the spacecraft over the lunar north polar region from the dark farside and continued across the illuminated nearside. This provided the first opportunity to observe northern and northeastern limb regions with a modern, multispectral imaging system with high spatial resolution (up to 1.1 km/pixel). Scientific objectives included compositional assessment of previously uncharacterized mare regions, study of various light plains materials, and assessment of dark mantle deposits (DMD) and dark halo craters (DHC). Color composite images were prepared from ratios of Galileo SSI filter data (0.76/0.41 yields red; 0.76/0.99 yields green; 0.41/0.76 yields blue) and used for preliminary comparison of units. The 0.41/0.76 ratio has been empirically correlated to Ti content of mare soils (blue is relatively high, red is relatively low). The relative strengths of the ferrous one micron absorption in mafic minerals can be compared using the 0.76/0.99 ratio. In addition, relative ages of units analyzed spectrally were determined from crater statistics using Lunar Orbiter images following the techniques of Neukum et al. Mare deposits analyzed include Mare Humboldtianum, central and eastern Mare Frigoris, Mare Crisium and other deposits in the Crisium Basin, and isolated mare patches on the northeastern lunar limb. Preliminary results show a diversity of 0.41/0.76 micron signatures, implying a wide range of titanium contents. Some light plains units are similar to units found at the Apollo 16 site; others may be ancient mare materials. Dark mantle deposits (DMD) analyzed also are available. Author

Wenrich (Arizona State Univ., Tempe.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 567-568 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Many proposed missions to Mars involve landing vehicles, including the Mars 94/96 (Russia), Mars Environmental Survey (MESUR, US), and the Marsnet (ESA) missions. Most landers involve in situ measurements of rock and soil compositions, study of local geology by imaging, and establishment of seismic and meteorological networks. The selection of landing sites on Mars is a complex process that must meet engineering constraints and scientific objectives, using available and anticipated data. The goal of the MASS project is to conduct an 'end-to-end' test of the site selection process using Earth analogs. Derived from text

EARTH IMAGING RESULTS FROM GALILEO'S SECOND ENCOUNTER Abstract Only

R. Greenberg, M. Belton (Kitt Peak National Observatory, Tucson, AZ.), E. DeJong (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), A. Ingersoll (California Inst. of Tech., Pasadena.), K. Klaasen (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), P. Geissler (Arizona Univ., Tucson.), J. Moersch (Cornell Univ., Ithaca, NY.), and W. R. Thompson (Cornell Univ., Ithaca, NY.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 569 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The recent flyby of the Galileo spacecraft en route to Jupiter contributes a unique perspective to our view of our home planet. Imaging activities conducted during the second Earth encounter provide an important opportunity to assess new methods and approaches on familiar territory. These include unique multispectral observations, low light-level imaging

(searches for aurorae, lightning and artificial lights on the nightside) and experiments with multiple exposure times to extend the effective radiometric resolution and dynamic range of the camera system. Galileo imaging data has the potential to make important contributions to terrestrial remote sensing. This is because the particular set of filters included in the Solid State Imaging system are not presently incorporated in any currently operating Earth-orbiting sensor system. The visible/near-infrared bandpasses of the SSI filters are well suited to remote sensing of geological, glaciological, botanical, and meteorological phenomena. Data from this and the previous Earth encounter may provide an extremely valuable reference point in time for comparison with similar data expected from EOS or other systems in the future, contributing directly to our knowledge of global change. The highest resolution imaging (0.2 km/pixel) during the December, 1992 encounter occurred over the central Andes; a five filter mosaic of visible and near infrared bands displays the remarkable spectral heterogeneity of this geologically diverse region. As Galileo departed the Earth, cooperative imaging with the Near Infrared Mapping Spectrometer (NIMS) instrument targeted Antarctica, Australia, and Indonesia at 1.0 to 2.5 km/pixel resolutions in the early morning local times near the terminator. The Antarctic data are of particular interest, potentially allowing ice grain size mapping using the 889 and 968 nm filters and providing an important means of calibrating the technique for application to the Galilean satellites. As the spacecraft receded further, regional scale imaging provided data which, along with data from the previous encounter, will enable the production of global multispectral mosaics of Earth in each of the SSI filters. COLLISIONAL AND DYNAMICAL HISTORY OF GASPRA Abstract Only **c90**
R. Greenberg, M. C. Nolan, W. F. Bottke, Jr., and R. A. Kolvoord *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 571-572 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Interpretation of the impact record on Gaspra requires understanding of the effects of collisions on a target body of Gaspra's size and shape, recognition of impact features that may have different morphologies from craters on larger planets, and models of the geological processes that erase and modify impact features. Crater counts on the 140 sq km of Gaspra imaged at highest resolution by the Galileo spacecraft show a steep size-frequency distribution (cumulative power-law index near -3.5) from the smallest resolvable size (150 m diameter) up through the large feature (1.5 km diameter crater) of familiar crater-like morphology. In addition, there appear to be as many as eight roughly circular concavities with diameters greater than 3 km visible on the asteroid. If we restrict our crater counts to features with traditionally recognized crater morphologies, these concavities would not be included. However, if we define craters to include any concave structures that may represent local or regional damage at an impact size, then the larger features on Gaspra are candidates for consideration. Acceptance of the multi-km features as craters has been cautious for several reasons. First, scaling laws (the physically plausible algorithms for extrapolating from experimental data) indicate that Gaspra could not have sustained such large-crater-forming impacts without being disrupted; second, aside from concavity, the larger structures have no other features (e.g. rims) that can be identified with known impact craters; and third, extrapolation of the power-law size distribution for smaller craters predicts no craters larger than 3 km over the entire surface. On the other hand, recent hydrocode modeling of impacts shows that for given impact (albeit into a sphere), the crater size is much larger than given by scaling laws. Gaspra-size bodies can sustain formation of up to 8-km craters without disruption. Besides allowing larger impact craters, this result doubles the lifetime since the last catastrophic fragmentation event up to one billion years. Events that create multi-km craters also globally damage the material structure, such that regolith is produced, whether or not Gaspra 'initially' had a regolith, contrary to other models in which initial regolith is required in order to allow current regolith. Because the globally destructive shock wave precedes basin formation, crater size is closer to the large size extrapolated from gravity-scaling rather than the strength-scaling that had earlier been assumed for such small bodies. This mechanism may also help explain the existence of Stickney on Phobos. Moreover, rejection of the large concavities as craters based on unfamiliar morphology would be premature, because (aside from Stickney) we have no other data on such large impact structures on such a small, irregular body. The eight candidate concavities cover an area greater than that counted for smaller craters, because they are most apparent where small craters cannot be seen: on low resolution images and at the limb on high resolution images. We estimate that there are at least two with diameter greater than 4 km per 140 sq km, which would have to be accounted for in any model that claims these are impact craters. Author

PETROGRAPHY, MINERALOGY, AND Mg ISOTOPE COMPOSITION OF VICTA: A VIGARANO CaAl4O7-BEARING TYPE A INCLUSION Abstract Only **c46**
R. C. Greenwood, A. Morse (Open Univ., Milton, England.), and J. V. P. Long (Cambridge Univ., England.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 573-574 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Thermodynamic calculations predict that Ca-dialuminate ($CaAl_4O_7$) condenses from a cooling gas of solar composition after hibonite and before melilite. Although Ca-dialuminate has now been recorded from Ca Al-rich inclusions (CAI's) in at least 9 meteorites, compared to hibonite it is a relatively rare phase. As pointed out by Michel-Levy et al., the absence of Ca-dialuminate from most hibonite-bearing inclusions poses a serious problem for the condensation model of CAI formation. Here we describe an inclusion which contains abundant CA-dialuminate partially altered to a hercynite-rich ($FeAl_2O_4$) assemblage. The evidence from VICTA indicates that compared to all other phases in type A inclusions, Ca-dialuminate is the most susceptible to secondary alteration; a feature which may explain its restricted occurrence. Unaltered Ca-dialuminate and melilite in VICTA display excess Mg-26 indicative of in situ decay of Al-26. Author

EXPLOSIVE MAFIC VOLCANISM ON EARTH AND MARS Abstract Only
Tracy K. P. Gregg and Stanley N. Williams *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 575-576 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Deposits within Amazonia Planitia, Mars, have been interpreted as ignimbrite plains on the basis of their erosional characteristics. The western flank of Hecates Tholus appears to be mantled by an airfall deposit, which was produced through magma-water interactions or exsolution of magmatic volatiles. Morphologic studies, along with numerical and analytical modeling of Martian plinian columns and pyroclastic flows, suggest that shield materials of Tyrrhena and Hadriaca paterae are composed of welded pyroclastic flows. Terrestrial pyroclastic flows, ignimbrites, and airfall deposits are typically associated with silicic volcanism. Because it is unlikely that large volumes of silicic lavas have been produced on Mars, we seek terrestrial analogs of explosives, mafic volcanism. Plinian basaltic airfall deposits have been well-documented at Masaya, Nicaragua, and basaltic ignimbrite and surge deposits also have been recognized there. Ambrym and Yasour, both in Vanuatu, are mafic stratovolcanioes with large central calderas, and are composed of interbedded basaltic pyrocalstic deposits and lava flows. Zavaritzki, a mafic stratovolcano in the Kurile Islands, may have also produced pyroclastic deposits, although the exact nature of these deposits in unknown. Masaya, Ambrym and Yasour are known to be located above tensional zones. Hadriaca and Tyrrhena Paterae may also be located above zones of tension, resulting from the formation and evolution of Hellas basin, and, thus, may be directly analogous to these terrestrial mafic, explosive volcanoes. HELIOCENTRIC ZONING OF THE ASTEROID BELT BY ALUMINUM-26 HEATING Abstract Only **c90**
R. E. Grimm and H. Y. McSween, Jr. (Tennessee Univ., Knoxville.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 577-578 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Variations in petrology among meteorites attest to a strong heating event early in solar system history, but the heat source has remained

unresolved. Aluminum-26 has been considered the most likely high-energy, short-lived radionuclide (half-life 0.72 million years) since the discovery of its decay product - excess Mg-26 - in Allende CAI's. Furthermore, observation of relict Mg-26 in an achondritic clast and in feldspars within ordinary chondrites (3,4) provided strong evidence for live Al-26 in meteorite parent bodies and not just in refractory nebular condensates. The inferred amount of Al-26 is consistent with constraints on the thermal evolution of both ordinary and carbonaceous chondrite parent objects up to a few hundred kilometers in diameter. Meteorites can constrain the early thermal evolution of their parent body locations, provided that a link can be established between asteroid spectrophotometric signature and meteorite class. Asteroid compositions are heliocentrically distributed: objects thought to have experienced high metamorphic or even melting temperatures are located closer to the sun, whereas apparently unaltered or mildly heated asteroids are located farther away. Heliocentric zoning could be the result of Al-26 heating if the initial amount of the radionuclide incorporated into planetesimals was controlled by accretion time, which in turn varies with semimajor axis. Analytic expressions for planetary accretion may be integrated to given the time, tau, required for a planetesimal to grow to a specified radius: tau varies as a(sup n), where n = 1.5 to 3 depending on the assumptions about variations in the surface density of the planetesimal swarm. Numerical simulations of planetesimal accretion at fixed semimajor axis demonstrate that variations in accretion time among small planetesimals can be strongly nonlinear depending on the initial conditions and model assumptions. The general relationship with semimajor axis remains valid because it depends only on the initial orbit properties and distribution of the planesimal swarm. In order to demonstrate the basic dependence of thermal evolution on semimajor axis, we parameterized accretion time across the asteroid belt according to tau varies as a(sup n) and calculated the subsequent thermal history. Objects at a specified semimajor axis were assumed to have the same accretion time, regardless of size. We set the initial Al-26/Al-27 ratio = 6 x 10(exp -5) and treated n and tau(sub 0) at a(sub 0) = 3 AU as adjustable parameters. The thermal model included temperature-dependent properties of ice and rock (CM chondrite analog) and the thermodynamic effects of phase transitions. Author

EVOLUTIONARY IMPLICATIONS OF A STEADY-STATE WATER ABUNDANCE ON VENUS Abstract Only

David H. Grinspoon *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 579-580 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

In 1987, Grinspoon proposed that the data on hydrogen abundance, isotopic composition, and escape rate were consistent with the hypothesis that water on Venus might be in steady-state rather than monotonic decline since the dawn of time. This conclusion was partially based on a derived water lifetime against nonthermal escape of approximately 10(exp 8) years. Others have questioned this conclusion. De Bergh et al. found H2O lifetimes of greater than 10(exp 9) years. Donahue and Hodges derived H2O lifetimes of 0.4 - 5 x 10(exp 9) years. The most sophisticated analysis to date of near-IR radiation from Venus' nightside reveals a water mixing ratio of approximately 30 ppm. Recent re-analysis of Pioneer Venus Mass Spectrometer Data are consistent with a water abundance of 30 ppm. Hodges and Tinsley found an escape flux due to charge exchange with hot H(+) of 2.8 x 10(exp 7) cm(exp -2) s(exp -1). Gurwell and Yung estimated an escape flux of 3.5 x 10(exp 6) cm(exp -2) s(exp -1) from collisions with hot O produced by dissociative recombination of O2(+). Brace et al. estimated an escape flux of 5 x 10(exp 6) cm(exp -2) s(exp -1) from ion escape from the ionotail of Venus. The combined estimated escape flux from all of these processes is 3.7 x 10(exp 7) cm(exp -2) s(exp -1), suggesting a lifetime against escape for water of less than 10(exp 8) years. A recent estimate of H escape flux employing a different ionospheric model and using Pioneer Venus reentry data to estimate the response of the escape flux to the solar cycle finds a somewhat lower escape flux of 1.4 x 10(exp 7) cm(exp -2) s(exp -1), suggesting a water lifetime closer to 2 x 10(exp 8) years, significantly less than the age of the planet. Large uncertainties remain in these quantities, yet the data suggest that a source of water more recent than primordial sources is required and that a steady-state is likely. To obvious candidates for this source water are cometary impact and volcanic outgassing. Other aspects of this investigation are discussed. Author

SPATIALLY EXTENSIVE UNIFORM STRESS FIELDS ON VENUS INFERRED FROM RADIAL DIKE SWARM GEOMETRIES: THE APHRODITE TERRA EXAMPLE Abstract Only

Eric B. Grosfils and James W. Head *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 581-582 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The high resolution and near global coverage of Magellan radar images is facilitating attempts to systematically investigate the stresses that have deformed the venusian crust. Here we continue earlier efforts to utilize approximately 170 large, radially lineated structures interpreted as dike swarms to assess the orientation of the regional maximum horizontal compressive stress (MHCS) which existed in their vicinities during emplacement. Examination of swarms near the equator reveals a link to broad scale regional structures, such as Aphrodite Terra, across distances in excess of 1000 km, suggesting the existence of first order stress fields which affect areas of more than 10(exp 6) sq km in a uniform fashion. Focusing further upon the Aphrodite Terra region, the MHCS field in the surrounding lowlands inferred from radial swarms is oriented approximately normal to the slope of the highland topography. This stress configuration appears, at a simple level, to be incompatible with that expected during either upwelling or downwelling construction of the highlands. In addition, the relatively undeformed geometry of the radial structures within the highlands implies that these dike swarm features formed more recently than their highly deformed surroundings. We conclude that the differential stresses which existed during emplacement of the dike swarms within and adjacent to the Aphrodite Terra highlands are related to the gravitational relaxation of pre-existing topography. PETROLOGIC CONSTRAINTS ON THE SURFACE PROCESSES ON ASTEROID 4 VESTA AND ON EXCAVATION DEPTHS OF DIOGENITE FRAGMENTS Abstract Only **c90**

T. L. Grove *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 583-584 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The eucrite-howardite-diogenite meteorite groups are though to be related by magmatic processes. Asteroid 4 Vesta has been proposed as the parent body for these basaltic achondrite meteorites. The similarity of the planetesimal's surface composition to eucrite and diogenite meteorites and the large size of the asteroid (r = 250 km) make it an attractive source, but its position in the asteroid belt far from the known resonances from which meteorites originate make a relation between Vesta and eucrite-howardite-giogenite group problematic. It has been proposed that diogenites are low-Ca pyroxene-rich cumulates that crystallized from a magnesian parent (identified in howardite breccias), and this crystallization process led to evolved eucrite derivative magmas. This eucrite-diogenite genetic relationship places constraints on the physical conditions under which crystallization occurred. Elevated pressure melting experiments on magnesian eucrite parent compositions show that the minimum pressure at which pyroxene crystallization could lead to the observed compositions of main series eucrites is 500 bars, equivalent to a depth of 135 km in a 4 Vesta-sized eucrite parent body. Therefore, the observation of diogenite on the surface of 4 Vesta requires a post-crystallization process that excavates diogenite cumulate from depth. The discovery of diogenite asteroidal fragments is consistent with an impact event on 4 Vesta that penetrated the deep interior of this planetesimal. Author

THE PLANETARY DATA SYSTEM EDUCATIONAL CD-ROM Abstract Only **c82**

E. A. Guinness, R. E. Arvidson, M. Martin (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), and S. Dueck (Jet Propulsion Lab., California

Inst. of Tech., Pasadena.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 585-586 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The Planetary Data System (PDS) is producing a special educational CD-ROM that contains samples of PDS datasets and is expected to be released in 1993. The CD-ROM will provide university-level instructors with PDS-compatible materials and information that can be used to construct student problem sets using real datasets. The main purposes of the CD-ROM are to facilitate wide use of planetary data and to introduce a large community to the PDS. To meet these objectives the Educational CD-ROM will also contain software to manipulate the data, background discussions about scientific questions that can be addressed with the data, and a suite of exercises that illustrate analysis techniques. Students will also be introduced to the SPICE concept, which is a new way of maintaining geometry and instrument information. The exercises will be presented at the freshman through graduate student levels. With simplification, some of the material should also be of use at the high school level. Author

FLUVIAL EROSION ON MARS: IMPLICATIONS FOR PALEOCLIMATIC CHANGE Abstract Only **c90**
Virginia C. Gulick and Victor R. Baker *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 587-588 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Fluvial erosion on Mars has been nonuniform in both time and space. Viking orbiter images reveal a variety of different aged terrains exhibiting widely different degrees of erosion. Based on our terrestrial analog studies, rates of fluvial erosion associated with the formation of many of the valleys on Mars is probably on the order of hundreds of meters per million years, while rates of erosion associated with the formation of the outflow channels probably ranged from tens to hundreds of meters in several weeks to months. However, estimated rates of erosion of the Martian surface at the Viking Lander sites are extremely low, on the order of 1 micron/yr or less. At most this would result in a meter of material removed per million years, and it is unlikely that such an erosion rate would be able to produce the degree of geomorphic work required to form the fluvial features present elsewhere on the surface. In addition, single terrain units are not eroded uniformly by fluvial processes. Instead fluvial valleys, particularly in the cratered highlands, typically are situated in clusters surrounded by vast expanses of uneroded surfaces of the same apparent lithologic, structural, and hydrological setting. Clearly throughout its geologic history, Mars has experienced a nonuniformity in erosion rates. By estimating the amount of fluvial erosion on dissected terrains and by studying the spatial distribution of those locations which have experienced above normal erosion rates, it should be possible to place further constraints on Mars' paleoclimatic history. THE ACRAMAN IMPACT STRUCTURE: ESTIMATION OF THE DIAMETER BY THE EJECTA LAYER THICKNESS Abstract Only **c46**
E. P. Gurov *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 589-590 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The big role of gigantic craters formation in geological history of the Earth was established by the example of the K/T boundary event. The discovery of the iridium anomaly in the sedimentary rocks of Vendian in the western part of Ukrainian shield allows to suppose its origin in connection with the great impact of that time. The only big impact structure of that age is the Acraman Crater in south-eastern part of Australia. The Acraman Crater is presented by deeply eroded structure, original diameter of which it is difficult to determine. By geological and morphological data the Acraman Crater is presented by an inner ring 30 km in diameter, an intermediate ring 90 km in diameter, and an outer ring about 150-160 km in diameter. THE KARAKUL DEPRESSION IN PAMIRS: THE FIRST IMPACT STRUCTURE IN CENTRAL ASIA Abstract Only **c90**
E. P. Gurov, H. P. Gurova, R. B. Rakitskaya, and A. Yu. Yamnichenko *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 591-592 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The Karakul depression was picked out as the possible impact structure by the study of space images of Tadjikistan. Its striking similarity with some complex impact craters such as Dellen and Gosses Bluff is evident. Our investigations of the Karakul depression in 1987 and 1989-1991 years allowed to determine it as the impact crater with the central uplift. The target of the crater is presented by slightly metamorphosed sedimentary rocks of Paleozoic, intensively folded and intruded with granites during the Gercynian orogeny. The modern structure of north-eastern Pamirs was formed by Alpinian orogeny; the raise of the area in Neogene was about 4000-7000 m. Author

Avail: CASI HC A01/MF A06

Analysis of numerous individual iron meteorites have shown that fractional crystallization of iron cores result in variations in chemical concentration of the solid core which span several orders of magnitude. The magnitude and direction of the resulting spatial gradients in the core can provide clues to the physical nature of the core crystallization process. We have analyzed suites of samples from three large 3AB irons (Cape York, 58t; Chupaderos, 24t; Morito, 10t) in order to estimate local chemical gradients. Initial results for the concentrations of Ge, Pd, Pt (Massey group), Ir, Au, As, Co, Os, and Rh (Dalhouse group), and P (Arizona group) show significant ranges among the Cape York and Chupaderos samples and marginally significant ranges among the Morito samples. Measurements of Au, Ir, Co, Ni, Cu, Ga, As, W, Re (from UCLA) and Ni and Co (Arizona group) are in progress. We find a spatial Ir gradient in Chupaderos with a magnitude similar to the one reported for Agpalilik (Cape York iron) by Esbensen et al. Author

Avail: CASI HC A01/MF A06

Most investigators ascribe mare basalt magma genesis to partial melting at depths of approximately 130 to greater than 400 km within the cumulate pile deposited from a lunar magma ocean. Mare basalts share with mid-ocean ridge basalts the characteristic of relative depletion in LREE and other incompatible trace elements that arises from melting within 'used' mantle, from which crust-forming elements have already been separated. Some mare basalt types do not show the classical, La-Nd depleted mare basalt REE distributions; however, some types are isotopically heterogeneous. These differences have been ascribed to assimilation, mainly AFC-style, of KREEPy highland material overlying the source region. Might such

assimilation occur during magma ascent through the KREEPy material? To gain information from a terrestrial setting on possible assimilation during ascent, we have studied a suite of Quaternary nepheline-hawalites and nepheline-mugearites from the Bartoy cinder cone complex of the Baikal Rift, Siberia. The Bartoy magmas originated from greater than 80 km deep, and erupted through thick Archean crust. We find evidence for assimilation of approximately 31 wt. percent xenocrysts of garnet, aluminous clinopyroxene, kaersutite, and olivine, all presumably from the basalt source region, but no appreciable assimilation of overlying crust, consistent with isotopic constraints. Magmatic superheat made available by rapid ascent and decomposition accounts adequately for the energy of assimilation; no accompanying fractional crystallization is required or evident. Author

MORPHOLOGY AND MODELS FOR THE EVOLUTION OF EASTERN HECATE CHASMA, VENUS Abstract Only

Victoria E. Hamilton and Ellen R. Stofan (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 597-598 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Hecate Chasma is a deep trough characterized by a chain-like concentration of coronae and corona-like features trending approximately southwest-northeast between approximately 200 and 260 degrees east longitude (terminating at Beta Regio). The section of Hecate in which we have concentrated our study is centered at 15N, 249, where the trough is especially well-defined. Nearby, a smaller chain of eight coronae lies along a minor trough parallel to the general trend of the greater chain. The trough itself is unusual in this area because it has a highly asymmetric profile. Using Magellan radar and topography data, we have examined the morphology of this area in order to assess the tectonic and volcanic history of the area. After examining the most important types of features (linear, arcuate and circular) in eastern Hecate, we present two possible models of origin. A companion abstract presents an overview of the Hecate and Parga linear deformation zones. Author

A PLUTO THERMAL MODEL Abstract Only

C. J. Hansen and D. A. Paige (California Univ., Los Angeles.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 599 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The recent discovery of nitrogen on Pluto suggests that Pluto's volatile cycles may be similar to those on Neptune's moon Triton. Here, we report the first results of our efforts to apply a thermal model that we developed to study the seasonal nitrogen cycle on Triton to the case of Pluto. The model predicts volatile behavior as a function of time to calculate frost deposit depth, polar cap boundaries, temperature of the frost and substrate, and atmospheric pressure, assuming nitrogen frost deposits in solid-vapor equilibrium with nitrogen in the atmosphere. MODELING THE REFLECTANCE OF CO2 FROST WITH NEW OPTICAL CONSTANTS: APPLICATION TO MARTIAN SOUTH POLAR CAP SPECTRA Abstract Only

Gary B. Hansen and Terry Z. Martin (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 601-602 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

New measurements of the absorption coefficients of CO2 ice, in most of the spectral range 0.2 to 3.9 microns where absorption coefficients are below 1.5 per cm, have recently been made. Although these measurements are preliminary, they contain spectral detail not seen previously in the literature. Therefore, it is useful to combine these new data with older data from spectral regions of stronger absorption and reformulate models of the albedo or reflectance of CO2 frost. These models can then be adjusted in an attempt to match measurements of Martian polar deposits, such as the set of spectra returned by the IRS instrument on Mariner 7 (1969). The new absorption coefficients of CO2 ice were measured on several samples of 41-mm thickness at 150-155 K. A portion of the spectrum from 1.9 to 3.9 microns wavelength is shown in the form of imaginary coefficient of refraction (= linear absorption x wavelength / 4 pi). The data above 3x10(exp -5) are obtained from, except for the absorption line at 3.32 micrometers, which is extrapolated in a way that is consistent with laboratory frost measurements, but the peak level is still highly uncertain. This new imagary coefficient, combined with the real coefficient, can be immediately applied to the models for hemispherical albedo, resulting in markedly different results from those in that study. The results for an infinite optical depth layer and solar incidence of 60 degrees are plotted for a range of mean particle radii from 0.03 to 3 mm. Author

ISHTAR DEFORMED BELTS: EVIDENCE FOR DEFORMATION FROM BELOW? Abstract Only

V. L. Hansen and R. J. Phillips (Washington Univ., Saint Louis, MO.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 603-604 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The mountain belts of Ishtar Terra are unique on Venus. Models for their formation include mantle upwelling, mantle downwelling, and horizontal convergence. The present forms of these models are too simple to predict surface strain, topography, or gravity. More detailed models will require specific constraints as imposed by geologic relations. In order to develop specific constraints for geodynamic models, we examine the geology of Ishtar Terra as viewed in Magellan SAR imagery in an attempt to interpret regional surface strain patterns. In this paper, we present geologic and structural relations that leads us to postulate that Ishtar deformed belts result from shear forces within the mantle acting on the lithosphere, and not by horizontal forces from colliding plates. We propose that the surface strains result from differential strain and displacement of domains within the upper mantle, and that further analysis of Ishtar deformation may allow us to identify individual domains within the mantle, and to constrain displacement trajectories between domains. Nd-142/Nd-144 IN BULK PLANETARY RESERVOIRS, THE PROBLEM OF INCOMPLETE MIXING OF INTERSTELLAR COMPONENTS AND SIGNIFICANCE OF VERY HIGH PRECISION Nd-145/Nd-144 MEASUREMENTS Abstract Only

C. L. Harper, Jr. and S. B. Jacobsen *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 607-608 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Apart from the challange of very high precision Nd-142/Nd-144 ratio measurement, accurate applications of the coupled Sm-(146,147)-Nd-(142,143) systematics in planetary differentiation studies require very precise knowledge of the present-day (post-Sm-146 decay) Nd-142/Nd-144 ratios of bulk planetary objects (BP). The coupled systematics yield model ages for the time of formation of Sm/Nd-fractionated reservoirs by differentiation of Sm/Nd-unfractionated bulk planetary reservoirs. Estimates of (Nd-142/Nd-144)(sub BP) and (Nd-143/Nd-144)(sub BP) therefore provide the critical baseline relative to which these model ages are referenced. In the Sm-147-Nd-143 systematics, Nd-143/Nd-144 variations are mostly large; therefore, small variations in initial Nd-143/Nd-144 ratios generally can be ignored. However, in the case of Sm-146-Nd-142, the range of Nd-142/Nd-144 divergence for differentiated planetary reservoirs is much smaller. Consequently Sm-(146,147)-Nd-(142,143) model ages are

sensitive to small variations in bulk planetary Nd-142/Nd-144 (both present-day and initial). One major unanswered question is whether or not Nd shelf standards (CIT Nd beta/Ames metal, La Jolla, NASA-JSC/Ames metal) have Nd-142/Nd-144 identical to the bulk Earth or otherwise might record some degree of radiogenic evolution in an early-fractionated reservoir. Our discussions of earth Earth differentiation based on Nd-142/Nd-144 in Isua and Acasta samples have employed a working assumption: (Nd-142/Nd-144)(sub Nd beta) = (Nd-142/Nd-144)(sub Bulk Earth). This requires experimental justification and is apparently contradicted by chondrite Nd-142/Nd-144 measurements, which have been interpreted to indicate: (Nd-142/Nd-144)(sub JSC/Ames metal) = ((Nd-142/Nd-144)(sub CHUR) = 35 plus or minus 8 ppm). At present, interpretations of the early Earth and Moon hinge largely on this issue. Because Ba in bulk chondrite samples exhibit similar magnitude nuclear anomalies, attributable to incomplete mixing of interstellar components, a critical question is whether or not nuclear effects are also present in Nd-142/Nd-144, both in bulk chondrites and between planetary objects. Author

THE PHYSICAL MECHANISM OF COMET OUTBURSTS: AN EXPERIMENT Abstract Only **c90**
William K. Hartmann *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 609-610 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

During a series of impact experiments into regolith-like powders at the NASA Ames Research Center Vertical Gun Facility in 1976, I observed and filmed a unique anomalous event that may illuminate outburst mechanisms in comets. During one test, a new batch of basalt powder (half the mass in particles less than 800 microns in diameter) retained some air pressure while the vacuum chamber was being evacuated. As a result, the projectile impacted into gas-charged regolith. Instead of ejecting the normal, relatively negligible amount of debris, the disturbance triggered a major eruption that lasted at least 18 seconds. The experimental results have been recently re-analyzed with reference to cometary phenomena. A series of frames from this eruption experiment are shown. The ejecta velocities of 150 to 300 cm/s would have been sufficient to drive debris into the coma of a comet nucleus smaller than a few kilometers diameter. The event suggests a mechanism for comet outbursts, discussed briefly by Hartmann et al.: the pore space in a layer of regolith, possibly with weak effective tensile strength, becomes gas charged as ice slowly sublimates. Once the effective tensile strength is exceeded by the gas pressure, the surface fails locally, triggering an eruption such as photographed here. This model is consistent with the emerging view of regolith materials on comets and is closest to the recent model of Rickman et al. The earlier models generally picture a more uniform flow of debris off the comet, not outbursts. Rickman et al. allow gas pressure to build until it matches the overburden pressure, followed by 'instantaneous blow-off'. They note that as soon as the mantle is found to be unstable, we consider it to be instantaneously swept away by the gas pressure. The main new points made here are that the experiment gives a more realistic view of the blow-off process after surface failure occurs, and the present model gives a recharge mechanism that can explain recurrent outbursts on comets such as P/Schwassmann-Wachmann 1 and 2060 Chiron. In fact, the resulting jets resemble distinct jet structures in high-resolution comet comae.

CONFIRMATION OF SATURATION EQUILIBRIUM CONDITIONS IN CRATER POPULATIONS Abstract Only **c46**
William K. Hartmann and Robert W. Gaskell (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 611-612 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

We have continued work on realistic numerical models of cratered surfaces, as first reported at last year's LPSC. We confirm the saturation equilibrium level with a new, independent test. One of us has developed a realistic computer simulation of a cratered surface. The model starts with a smooth surface or fractal topography, and adds primary craters according to the cumulative power law with exponent -1.83, as observed on lunar maria and Martian plains. Each crater has an ejecta blanket with the volume of the crater, feathering out to a distance of 4 crater radii. We use the model to test the levels of saturation equilibrium reached in naturally occurring systems, by increasing crater density and observing its dependence on various parameters. In particular, we have tested to see if these artificial systems reach the level found by Hartmann on heavily cratered planetary surfaces, hypothesized to be the natural saturation equilibrium level. This year's work gives the first results of a crater population that includes secondaries. Our model 'Gaskell-4' (September, 1992) includes primaries as described above, but also includes a secondary population, defined by exponent -4. We allowed the largest secondary from each primary to be 0.10 times the size of the primary. These parameters will be changed to test their effects in future models. The model gives realistic images of a cratered surface although it appears richer in secondaries than real surfaces are. The effect of running the model toward saturation gives interesting results for the diameter distribution. Our most heavily cratered surface had the input number of primary craters reach about 0.65 times the hypothesized saturation equilibrium, but the input number rises to more than 100 times that level for secondaries below 1.4 km in size. CORVID METEOROIDS AND A GIORDANO BRUNO RAY ARE GENETICALLY RELATED Abstract Only **c90**
Jack B. Hartung *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 613-614 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Both Corvid meteoroids and the Giordano Bruno (GB) crater are products of recent events. On June 25, or 26, 1178, Corvid meteoroids and a portion of GB ejecta were at the same place in the Solar System and moved in the same direction (right ascension = 12 degrees and declination = +19 degrees). The ground track of this direction is the same as that of the most prominant GB ray (azimuth = 237 degrees). These 'coincidences' could not have occurred by change and, therefore, support the conclusions that the GB impact occurred on June 26, 1178, and that Corvid meteoroids are high-velocity ejecta fragments from that impact. Finally, those fragments ejected with somewhat lower velocities failed to escape from the Earth-Moon system and produced the prominant ray extending southwest from the GB crater. Between June 25 and July 2, 1937, a Corvid meteor shower was observed. The apparent lack of Corvid showers in other years suggests that Corvids are the product of a recent break-up event. The right ascension and declination, corrected for zenith attraction, of 192 degrees and -19 degrees were reported for the radiant of this shower. This corresponds to a right ascension and declination of the direction of motion of Corvid meteoroids of 12 degrees and +19 degrees. In ecliptic coordinates the celestial longitude and latitude of this direction are 18 degrees and +13 degrees. Author

PYROXENE EQUILIBRATION TEMPERATURES IN METAMORPHOSED ORDINARY CHONDRITES Abstract Only **c90**
R. P. Harvey, M. L. Bennett, and H. Y. McSween, Jr. *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 615-616 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Ordinary chondrites are divided into petrographic types based on observed mineralogical and textural properties consistent with progressive thermal metamorphism from low grade (type 3) to high (type 7). Regardless of the exact cause of the metamorphism, higher-type chondrites should retain information concerning peak temperatures reached and for what duration. Using the two-pyroxene geothermometer of Lindsley, we have calculated the equilibration temperatures for 26H, L and LL type 5 and 6 ordinary chondrites, to investigate the relative peak temperatures and equilibration-states reached by these various meteorite classes. The Lindsley thermometer relies on a detailed accounting of non-quadrilateral components in pyroxenes, whose recalculated compositions are then plotted onto an empirically-derived polythermal diagram from which temperatures can be interpolated. The reported uncertainty of this method is plus or minus 50 C; in addition, close spacing of isotherms on the graph (particularly for orthopyroxene compositions) increase this uncertainty. We have parameterized the Lindsley polythermal quadrilateral for 1 atm pressure (less than 2 bar), and interpreted recalculated coordinates directly in terms

of 25 C temperature intervals. Meteorites selected for this study include both relatively shocked and unshoked specimens; heavily weathered or visibly brecciated specimens were avoided. Temperatures were calculated from orthopyroxene (opx) and clinopyroxene (cpx) analyses within one relative percent of ideal sums and stoichiometry. Histograms summarizing the calculated temperatures for type 5 and 6 ordinary chondrites are shown. Author

During the Galileo spacecraft encounter with the Earth-Moon system in December, 1992, a variety of spectral data and imagery were obtained for the eastern limb region as well as much of the lunar nearside. In order to support this encounter, we have been collecting near-infrared spectra and other remote sensing data for that portion of the northeastern nearside (NEM region) for which the highest resolution Galileo data were obtained. Analysis of spectra obtained for highlands units in the NEN region indicates that most surface units are dominated by anorthositic norite. To date, no pure anorthosites have been identified in the region. Several dark-haloed impact craters have exposed mare material from beneath highlands-rich surface units. Hence, ancient mare volcanism occurred in at least a portion of the NEN region. Endogenic dark-haloed craters in the region are the source of localized dark mantle deposits (LDMD) of pyroclastic origin and at least two compositional groups are present. The Galileo spacecraft obtained very high-resolution remote sensing data for the northeastern part of the nearside of the Moon. In order to prepare for and support this encounter, we have collected and analyzed a variety of spectral data for the NEN region. Numerous unanswered questions exist for this region. These include: (1) the composition and stratigraphy of the local highlands crust, (2) the nature and mode of formation of regional light plains, (3) the composition of localized pyroclastic deposits, and (4) the distribution of possible cryptomare in the region. The purpose of this paper is to present the preliminary results of our analyzes of remote sensing data of remote sensing data obtained for the NEN region. Author

TESSERA TERRAIN ON VENUS: IMPLICATIONS OF TESSERA FLOODING MODELS AND BOUNDARY CHARACTERISTICS FOR GLOBAL DISTRIBUTION AND MODE OF FORMATION Abstract Only
James W. Head and Mikhail Ivanov (Academy of Sciences, USSR, Moscow.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 619-620 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Mapping of tessera terrain using Magellan global high-resolution data has shown that it comprises about 10 percent of the surface area of Venus, is not randomly distributed, is extremely highly deformed relative to intervening plains, lies at a wide range of elevations, is embayed by and largely predates adjacent volcanic plains, is generally negatively correlated with broad lowlands and volcanic rises, may underlie a considerable percentage of the superposed volcanic plains, and has linear/tectonic margins for about 27 percent of its boundaries. In this paper, we investigate further the distribution and origin of tessera through analysis of the changing nature of tessera occurrences during sequential flooding, and assessment of the nature and distribution of Type 2 (linear/tectonic) tessera boundaries. MODE OF EMPLACEMENT OF LUNAR MARE VOLCANIC DEPOSITS: GRABEN FORMATION DUE TO NEAR SURFACE DEFORMATION ACCOMPANYING DIKE EMPLACEMENT AT RIMA PARRY 5 Abstract Only
J. W. Head and L. Wilson (Lancaster Univ., England.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 621-622 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Theoretical analyses, together with the observed style of emplacement of lunar mare volcanic deposits, strongly suggest that mare volcanic eruptions are fed by dikes from source regions at the base of the crust or deeper in the lunar mantle. Some dikes intrude into the lower crust, while others penetrate to the surface and are the sources for voluminous outpourings of lava. Still others stall near the surface generating a near-surface extensional stress field. We have investigated the hypothesis that some lunar linear rilles (graben) are the near-surface manifestations of dikes intruded to shallow depths. For a specific example (Rima Parry 5), we show that the geometry of the faults implies a mean dike width of about 150 m and depth to the dike top of about 500 m, values consistent with other theoretical and observational data on lunar dike geometry. Localized pyroclastic deposits along Rima Parry 5 are evidence for the presence of near-surface magma, and are interpreted to be the result of degassing and pyroclastic eruption subsequent to the emplacement of the dike. LUNAR IMPACT BASINS: NEW DATA FOR THE NEARSIDE NORTHERN HIGH LATITUDES AND EASTERN LIMB FROM THE SECOND GALILEO FLYBY Abstract Only
J. W. Head, M. Belton (Kitt Peak National Observatory, Tucson, AZ.), R. Greeley (Arizona State Univ., Tempe.), C. Pieters, E. Fischer, J. Sunshine, K. Klaasen (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), A. McEwen (Geological Survey, Flagstaff, AZ.), T. Becker (Geological Survey, Flagstaff, AZ.), and G. Neukum (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Oberpfaffenhofen, Germany.) et al *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 623-624 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

During the December 1992 Galileo Earth/Moon encounter the northern half of the nearside, the eastern limb, and parts of the western farside of the Moon were illuminated and in view, a geometry that was complementary to the first lunar encounter in December, 1990, which obtained images of the western limb and eastern farside. The Galileo Solid State Imaging System (SSI) obtained multispectral images for these regions during the second encounter and color ratio composite images were compiled using combinations of band ratios chosen on the basis of telescopic spectra and laboratory spectra of lunar samples. Ratios of images taken at 0.41 and 0.76 micron are sensitive to changes in the slope in the visible portion of the spectrum, and ratios of 0.99 and 0.76 micron relate to the strength of near-infrared absorptions due to iron-rich mafic minerals (0.76/0.99 ratio) such as olivine and pyroxene. Results of the analyses of the compositional diversity of the crust, maria, and Copernican craters are presented elsewhere. Primary objectives for lunar basin analysis for the second encounter include analysis of: the north polar region and the Humboldtianum basin; the characteristics of the Imbrium basin along its northern border and the symmetry of associated deposits; the origin of light plains north of Mare Frigoris and associated with several other basins; the nature and significance of pre-basin substrate; the utilization of the stereo capability to assess subtle basis structure; the identification of previously unrecognized ancient basins; basin deposits and structure for limb and farside basins; and assessment of evidence for proposed ancient basins. These data and results will be applied to addressing general problems of evaluation of the nature and origin of basin deposits, investigation of mode of ejecta emplacement and ejecta mixing, analysis of the origin of light plains deposits, analysis of basin deposit symmetry/asymmetry, investigation of basin depth of excavation and crustal stratigraphy, and assessment of models for basin formation and evolution. Here we discuss some preliminary results concerning

lunar impact basins, their deposits, and prebasin substrates, using the same approaches that we employed for the Orientale and South Pole-Aitken basins using the data from the first encounter. Author

LUNAR SCOUT MISSIONS: GALILEO ENCOUNTER RESULTS AND APPLICATION TO SCIENTIFIC PROBLEMS AND EXPLORATION REQUIREMENTS Abstract Only
J. W. Head, M. Belton (Kitt Peak National Observatory, Tucson, AZ.), R. Greeley (Arizona State Univ., Tempe.), C. Pieters, A. McEwen (Geological Survey, Flagstaff, AZ.), G. Neukum (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Berlin, Germany.), and T. McCord (Hawaii Univ., Honolulu.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 625-626 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The Lunar Scout Missions (payload: x-ray fluorescence spectrometer, high-resolution stereocamera, neutron spectrometer, gamma-ray spectrometer, imaging spectrometer, gravity experiment) will provide a global data set for the chemistry, mineralogy, geology, topography, and gravity of the Moon. These data will in turn provide an important baseline for the further scientific exploration of the Moon by all-purpose landers and micro-rovers, and sample return missions from sites shown to be of primary interest from the global orbital data. These data would clearly provide the basis for intelligent selection of sites for the establishment of lunar base sites for long-term scientific and resource exploration and engineering studies. The two recent Galileo encounters with the Moon (December, 1990 and December, 1992) illustrate how modern technology can be applied to significant lunar problems. We emphasize the regional results of the Galileo SSI to show the promise of geologic unit definition and characterization as an example of what can be done with the global coverage to be obtained by the Lunar Scout Missions. LAVA FLOW-FIELD MORPHOLOGICAL CLASSIFICATION AND INTERPRETATION: EXAMPLES FROM VENUS Abstract Only
J. W. Head, K. Magee Roberts, L. Wilson (Lancaster Univ., England.), and H. Pinkerton *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 627-628 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Recent analyses suggest that thermal constraints will act to limit the maximum length of an advancing lava flow being fed at a given volume or mass effusion rate from a vent. These constraints can be characterized through the Gratz number, which has a large value at the vent and decreases down flow; under a wide range of conditions, motion apparently ceases when the Gratz number has decreased to a value close to 300. In cooling-limited flows, effusion from the vent should be steady; the flow front thickens, eventually stops due to this cooling, and the central channel does not drain. If the vent remains active, a break-out flow will form from some point on the margin of the initial flow unit. If flows on planetary surfaces can be shown to be cooling limited, eruption rates can be estimated. In this analysis, we illustrate the morphological characteristics of various flow configurations, and we describe the application of these concepts to a flow length histogram for a hypothetical flow field and then apply this to an example on Venus. MODES OF FORMATION OF LUNAR LIGHT PLAINS AND THE DETECTION OF CRYPTOMARIA DEPOSITS Abstract Only
James W. Head, John Mustard, Irene Antonenko, and B. Ray Hawke (Hawaii Univ., Honolulu.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 629-630 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The early volcanic and impact histories of the Moon are closely linked and the record preserved in surface morphology and samples is tightly convolved because of the interaction of the two processes. The deconvolution of the record is an important goal in order to assess early volcanic flux and the mode of emplacement of large crater and basin deposits. For example, lunar light plains have been variously interpreted as volcanic, impact, and volcanic covered by impact deposits. The development of criteria for the determination of the origin of light plains and the detection of cryptomaria is a key to the deconvolution of this early record. We outline the various hypotheses for the origin of and potential modes of occurrence of light plains and cryptomaria, and develop criteria for their recognition and documentation. We use the example of the Schiller-Schickard and Balmer cryptomaria to illustrate the application of these techniques to the problem of light plains interpretation and cryptomaria documentation. CHEMICAL DIFFERENTIATION, THERMAL EVOLUTION, AND CATASTROPHIC OVERTURN ON VENUS: PREDICTIONS AND GEOLOGIC OBSERVATIONS Abstract Only
James W. Head, E. M. Parmentier, and P. C. Hess *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 631-632 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Observations from Magellan show that: (1) the surface of Venus is generally geologically young, (2) there is no evidence for widespread recent crustal spreading or subduction, (3) the crater population permits the hypothesis that the surface is in production, and (4) relatively few impact craters appear to be embayed by volcanic deposits suggesting that the volcanic flux has drastically decreased as a function of time. These observations have led to consideration of hypotheses suggesting that the geological history of Venus may have changed dramatically as a function of time due to general thermal evolution, and/or thermal and chemical evolution of a depleted mantle layer, perhaps punctuated by catastrophic overturn of upper layers or episodic plate tectonics. We have previously examined the geological implications of some of these models, and here we review the predictions associated with two periods of Venus history. Stationary thick lithosphere and depleted mantle layer, and development of regional to global development of regional to global instabilities, and compare these predictions to the geological characteristics of Venus revealed by Magellan. Part of the scientific payload of the Mars-96 mission is a Fe-(57)Mossbauer (MB) spectrometer installed on a small rover to be placed on the surface of Mars. The instrument is under development at the University of Darmstadt. This instrument, with some modifications, is also included in the scientific payload of the proposed MARSNET mission of the European Space Agency (ESA). A similar instrument is currently under development in the US. The reason for developing a Mossbauer spectrometer for space applications is the high abundance of the element iron, especially on the surface of Mars. The elemental composition of Martian soil was determined during the Viking mission in 1976 but not it's mineralogical composition. One believes that it is composed mainly of iron-rich clay minerals, with an iron content of about 14 (plus or minus 2) wt-percent, partly magnetic. Of extremely great interest are the oxidation state of the iron, the magnetic phases and the mineral composition of the Mars surface. To these questions MB spectroscopy can provide important information, which are not available by other methods. We report on first tests of the experimental setup in the temperature range plus 20 C to -70 C, roughly corresponding to the temperature range on the surface of Mars. Also questions concerning the signal/noise ratio (S/N) are discussed. Author

As of December 1992, the Galileo spacecraft performed its second and final flyby (EM2), of the Earth-Moon system, during which it acquired Solid State Imaging (SSI) camera images of the lunar surface suitable for photometric analysis using Hapke's, photometric model. These images, together with those from the first flyby (EM1) in December 1989, provide observations of all of the Apollo landing sites over a wide range of photometric geometries and at eight broadband filter wavelengths ranging from 0.41 micron to 0.99 micron. We have completed a preliminary photometric analysis of Apollo landing sites visible in EM1 images and developed a new strategy for a more complete analysis of the combined EM1 and EM2 data sets in conjunction with telescopic observations and spectrogoniometric measurements of returned lunar samples. No existing single data set, whether from spacecraft flyby, telescopic observation, or laboratory analysis of returned samples, describes completely the light scattering behavior of a particular location on the Moon at all angles of incidence (i), emission (e), and phase angles (a). Earthbased telescopic observations of particular lunar sites provide good coverage of incidence nad phase angles, but their range in emission angle is limited to only a few degrees because of the Moon's synchronous rotation. Spacecraft flyby observations from Galileo are now available for specific lunar features at many photometric geometries unobtainable from Earth; however, this data set lacks coverage at very small phase angles (a less than 13 deg) important for distinguishing the well-known 'opposition effect'. Spectrogoniometric measurements from returned lunar samples can provide photometric coverage at almost any geometry; however, mechanical properties of prepared particulate laboratory samples, such as particle compaction and macroscopic roughness, likely differ from those on the lunar surface. In this study, we have developed methods for the simultaneous analysis of all three types of data: we combine Galileo and telescopic observations to obtain the most complete coverage with photometric geometry, and use spectrogoniometric observations of lunar soils to help distinguish the photometric effects of macroscopic roughness from those caused by particle phase function behavior (i.e., the directional scattering properties of regolith particles). EMPLACEMENT OF MULTIPLE FLOW UNITS ON VERY SHALLOW SLOPES, EAST KAWELU PLANITIA FLOW FIELD, VENUS Abstract Only

Michael B. Helgerud and James R. Zimbelman (Smithsonian Institution, Washington, DC.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 637-638 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Lobate flows with variable radar brightness occur at several locations on Venus. Here we present preliminary mapping results for a lava flow field on the eastern side of Kawelu Planitia, centered at approximately 41 deg N, 251 deg E. Numerous individual flows of varying brightness can be traced for up to 400 km at this location. Megallan image F-MIDRP.40N251;1 contains two major flow complexes as well as a distinct minor flow field associated with a volcanic dome. The southern flow field (unit F) changes from radar dark to radar bright in a convex arc from west to east. The flow path is diverted by a ridge system (unit B) and associated N-S faulted zone (unit A) evident in the Magellan altimetry data. The 130-km-long radar-bright flow field located at 41.5 deg N and 249-250 deg E is comprised of a narrow, channeled flow (unit E) overlying an intermediate brightness flow (unit D), all of which appears to emanate from a solitary dome at 249 deg E. The southern lobe of unit E disappears under a broad leveed channel (41.3 deg N, 250.1 deg E) in unit 5, only to reappear south of the unit 5 boundary. The source of this largest flow field is not evident, but could be associated with the region of small domes west of the F-MIDRP image (centered at 41 deg N, 246 deg E). Another possible source is the fractured area south of unit C. The flow complex is clearly a conglomeration of many flow episodes, not necessarily from a single source. Author

NEAR-SURFACE TEMPERATURE GRADIENTS AND THEIR EFFECTS ON THERMAL-INFRARED EMISSION SPECTRA OF PARTICULATE PLANETARY SURFACES Abstract Only

B. G. Henderson and B. M. Jakosky *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 639-640 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The infrared energy emitted from a planetary surface is generated within a finite depth determined by the material's absorption skin depth. This parameter varies significantly with wavelength in the infrared but has an average value of around 50 microns for most geologic materials. In solid rock, heat transfer is efficient enough so that this 50 micron zone of the near surface from which the radiation emanates will be more or less isothermal. In particulate materials, however, heat transfer is more complicated and occurs via a combination of mechanisms, including solid conduction within grains and across grain contacts, conduction through the interstitial gas, and thermal radiation within individual particles and across the void spaces in between grains. On planets with substantial atmospheres, the gas component dominates the heat transfer and tends to mitigate near-surface thermal gradients. However, on airless bodies, the gas component is absent and heat transfer occurs via solid conductions and radiation. If the particles are small relative to the average absorption skin depth, then the top 50-100 microns or so of the surface will be cooled by radiation to space allowing the creation of significant near-surface thermal gradients. In those regions of the spectrum where the absorption coefficient is low, the emission will come from the deeper, warmer parts of the medium, whereas in regions of high absorption, the emission will emanate from shallower, cooler parts of the medium. The resulting emission spectrum will show non-compositional features as a result of the thermal structure in the material. We have modeled the heat transfer in a particulate medium in order to determine the magnitude of near-surface thermal gradients for surfaces on airless bodies and on Mars. We use the calculated thermal structure to determine the effects it has on the infrared emission spectrum of the surface. Author (revised)

BUBBLE COALESCENCE IN MAGMAS Abstract Only **c46**

Richard A. Herd and Harry Pinkerton *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 641-642 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The most important factors governing the nature of volcanic eruptions are the primary volatile contents, the ways in which volatiles exsolve, and how the resulting bubbles grow and interact. In this contribution we assess the importance of bubble coalescence. The degree of coalescence in alkali basalts has been measured using Image Analysis techniques and it is suggested to be a process of considerable importance. Binary coalescence events occur every few minutes in basaltic melts with vesicularities greater than around 35 percent. Author (revised)

THERMAL INERTIA AND RADAR REFLECTIVITY OF THE MARTIAN NORTH POLAR ERG: LOW-DENSITY AGGREGATES Abstract Only

K. E. Herkenhoff *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 643-644 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The north polar layered deposits on Mars appear to be the source of the dark material that comprises the north polar erg. The physical properties and chemical composition of the erg material therefore have important implications for the origin and evolution of the Martian layered deposits. Viking bistatic radar and infrared thermal mapping (IRTM) data indicate that the bulk density of the erg material is lower than that of the average

Martian surface. These data are consistent with hypotheses involving formation of filamentary sublimation residue (FSR) particles from erosion of the layered deposits. The color and albedo of the erg and of the layered deposits, and the presence of magnetic material on Mars, suggest that the dark material is composed of low-density aggregates of magnetic dust grains, perhaps similar to FSR particles created in laboratory experiments.

THE THREE AGES OF VENUS: A HYPOTHESIS BASED ON THE CRATERING RECORD Abstract Only
R. R. Herrick *In its* Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 645-646 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The elevation range of 6051.9 - 6053.9 km on Venus is deficient in craters but has a high proportion of embayed and tectonically deformed craters. On the basis of this data and previous work, I propose that Venus has experienced three distinct geologic ages: pseudo-plate tectonics until 1 - 2 Ga, volcanic flooding of low-lying areas, and currently hot spot tectonics.

Avail: CASI HC A01/MF A06

An exposure age for an iron meteorite can be calculated from measurements of a radioactive nuclide and a stable nuclide that are produced by similar sets of nuclear reactions, provided that the stable nuclide is present with low initial abundance. The standard methods rely on either K-40 (t(sub 1/2) = 1.26 Gy), K-39, and K-41 or on a shorter-lived radionuclide and a stable, noble gas isotope. Widely used pairs of this type include Cl-36/Ar-36 and Al-26/Ne-21. Other pairs that may serve the purpose for iron meteorites contain many stable isotopes besides those of K and the noble gases that are produced partly by cosmic rays. We consider here the calculation of exposure ages, t(sub 26), from measurements of Al-26 (t(sub 1/2) = 0.7 My) and (stable) Mg-26. Ages based on Al-26/Mg-26 ratios, like those based on Cl-36/Ar-36 ratios, are 'buffered' against changes in relative production rates due to shielding because decay of the radioactive nuclide accounts for a good part of the inventory of the stable nuclide.

THE ILMENITE LIQUIDUS AND DEPTHS OF SEGREGATION FOR HIGH-Ti PICRITE GLASSES Abstract Only c27
P. C. Hess *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 649-650 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Lunar picrite glasses represent primitive and perhaps near primary liquids which have suffered only minor degrees of crystallization or near crustal modification. These glasses are multisaturated with olivine and orthopyroxene at pressures from 20-25 kb. I argue below that high TiO2 mare glasses were indeed equilibrated with orthopyroxene and were segregated from the lunar mantle at mean depths of 400-500 km. The glasses are typically modelled as products of relatively low degrees of melting of an hybridized source resulting from the overturn and mixing of the gravitationally unstable cumulate pile. But the models are neither unique nor, in some cases, correct.

OVERTURN OF MAGMA OCEAN ILMENITE CUMULATE LAYER: IMPLICATIONS FOR LUNAR MAGMATIC EVOLUTION AND FORMATION OF A LUNAR CORE Abstract Only
P. C. Hess and E. M. Parmentier *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 651-652 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

We explore a model for the chemical evolution of the lunar interior that explains the origin and evolution of lunar magmatism and possibly the existence of a lunar core. A magma ocean formed during accretion differentiates into the anorthositic crust and chemically stratified cumulate mantle. The cumulative mantle is gravitationally unstable with dense ilmenite cumulate layers overlying olivine-orthopyroxene cumulates with Fe/Mg that decreases with depth. The dense ilmenite layer sinks to the center of the moon forming the core. The remainder of the gravitationally unstable cumulate pile also overturns. Any remaining primitive lunar mantle rises to its level of neutral buoyancy in the cumulate pile. Perhaps melting of primitive lunar mantle due to this decompression results in early lunar Mg-rich magmatism. Because of its high concentration of incompatible heat producing elements, the ilmenite core heats the overlying orthopyroxene-bearing cumulates. As a conductively thickening thermal boundary layer becomes unstable, the resulting mantle plumes rise, decompress, and partially melt to generate the mare basalts. This model explains both the timing and chemical characteristics of lunar magmatism.

GEOCHEMISTRY AND COSMOCHEMISTRY OF FULLERENES 3: REACTION OF C60 AND C70 WITH OZONE Abstract Only c25
D. Heymann and L. P. F. Chibante *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 653-654 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

C60 and C70 dissolved in toluene were treated with O2 gas containing 2.6 volume percent ozone and with O3-free oxygen. No reaction products were detected for 0.1 mole of O2 passed through the solution, but destruction of C60 was clearly detectable for a dose of 10(exp -6) moles of O3. C70 was destroyed more slowly than C60. Among the substances remaining in solution, we identified C60O, C70O, C60O2, C60O3, and C60O4. C60 crystals exposed to O3 at room temperature became less soluble in toluene in a matter of days, but oxides were apparently not formed.

TRACE-ELEMENT COMPOSITION OF CHICXULUB CRATER MELT ROCK, K/T TEKTITES AND YUCATAN BASEMENT Abstract Only c90
A. R. Hildebrand, D. C. Gregoire, M. Attrep, Jr. (Los Alamos National Lab., NM.), P. Claeys (California Univ., Davis.), C. M. Thompson (Arizona Univ., Tucson.), and W. V. Boynton (Arizona Univ., Tucson.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 657-658 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The Cretaceous/Tertiary (K/T) boundary Chicxulub impact is the best preserved large impact in the geologic record. The Chicxulub crater has been buried with no apparent erosion of its intracrater deposits, and its ejecta blanket is known and is well preserved at hundreds of localities globally. Although most of the molten material ejected from the crater has been largely altered, a few localities still preserve tektite glass. Availability of intra- and extracrater impact products as well as plausible matches to the targeted rocks allows the comparison of compositions of the different

classes of impact products to those of the impacted lithologies. Determination of trace-element compositions of the K/T tektites, Chicxulub melt rock, and the targeted Yucatan silicate basement and carbonate/evaporite lithologies have been made using instrumental neutron activation analysis (INAA) and inductively coupled plasma mass spectrometry (ICP-MS). Some sample splits were studied with both techniques to ensure that inter-laboratory variation was not significant or could be corrected. The concentration of a few major and minor elements was also checked against microprobe results. Radiochemical neutron activation analysis (RNAA) was used to determine Ir abundances in some samples. COMPARISON OF REFLECTANCE SPECTRA OF C ASTEROIDS AND UNIQUE C CHONDRITES Y86720, Y82162, AND B7904 Abstract Only **c90**

T. Hiroi, C. M. Pieters (Brown Univ., Providence, RI.), and M. E. Zolensky *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 659-660 (For primary document see N94-16173 03-91)

(Grant NAGw-748)

Avail: CASI HC A01/MF A06

Reflectance spectra (0.3-2.6 microns) of 11 carbonaceous (C) chondrite powders (less than 100 or less than 125 microns) including 'unique' ones Y86720, Y82162, and B7904, have been measured and compared with those of 14 C asteroids. Among those C chondrites, only three 'unique' ones had close counterparts among C asteroids (Y86720 and 1 Ceres, Y82162 and 704 Interamnia, and B7904 and 31 Euphrosyne). Mixing calculations of those C chondrites by Hapke's isotropic model were also performed to improve fits of reflectance spectra of all the 14 C asteroids. If the grain-size distributions of those asteroid surfaces are similar to those C chondrite powders, the result suggests that all tested C asteroids contain a high amount of heated C chondrite material, such as Y86720, Y82162, and B7904. PHASE EQUILIBRIA OF THE MAGNESIUM SULFATE-WATER SYSTEM TO 4 KBARS Abstract Only **c25**

D. L. Hogenboom, J. S. Kargel (Arizona Univ., Tucson.), J. P. Ganasan, and L. Lee *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 661-662 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Magnesium sulfate is the most abundant salt in carbonaceous chondrites, and it may be important in the low-temperature igneous evolution and aqueous differentiation of icy satellites and large chondritic asteroids. Accordingly, we are investigating high-pressure phase equilibria in MgSO4-H2O solutions under pressures up to four kbars. An initial report was presented two years ago. This abstract summarizes our results to date including studies of solutions containing 15.3 percent, 17 percent, and 22 percent MgSO4. Briefly, these results demonstrate that increasing pressure causes the eutectic and peritectic compositions to shift to much lower concentrations of magnesium sulfate, and the existence of a new low-density phase of magnesium sulfate hydrate. EXPERIMENTAL CONSTRAINTS ON CO2 AND H2O IN THE MARTIAN MANTLE AND PRIMARY MAGMAS Abstract Only

John R. Holloway, Kenneth J. Domanik, and Peter A. Cocheo *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 663-664 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

We present new data on the stability of hornblende in a Martian mantle composition, on CO2 solubility in iron-rich basaltic magmas, and on the solubility of H2O in an alkalic basaltic magma. These new data are combined with a summary of data from the literature to present a summary of the current state of our estimates of solubilities of H2O and CO2 in probable Martian magmas and the stability of hornblende in a slightly hydrous mantle. The new results suggest that hornblende stability is not sensitive to the Mg/(Mg+Fe) ratio (mg#) of the mantle, that is the results for terrestrial mantle compositions are similar to the more iron-rich Martian composition. Likewise, CO2 solubility in iron-rich tholeiitic basaltic magmas is similar to iron-poor terrestrial compositions. The solubility of H2O has been measured in an alkalic basaltic (basanite) composition for the first time, and it is significantly lower than predicted for models of water solubility in magmas. The lack of mg# dependence observed in hornblende stability and on CO2 solubility that in many cases terrestrial results can be applied to Martian compositions. This conclusion does not apply to other phenomena such as primary magma compositions and major mantle mineral mineralogy. Author (revised)

THE SIZE OF COMPLEX CRATERS Abstract Only

K. A. Holsapple *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 665-666 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Lunar craters larger than about 15 km and terrestrial craters larger than about 3 km in diameter presumably underwent gravity-driven, 'late-stage' collapse that modified an initial transient bowl-shaped 'simple' crater into the flat-floored complex craters observed. These same mechanisms were operative for the larger craters on other solar system bodies, at a threshold size inversely proportional to gravity. This paper presents a new look at the scaling relations for these complex craters. Author (revised)

SIDEROPHILE ELEMENTS IN THE UPPER MANTLE OF THE EARTH: NEW CLUES FROM METAL-SILICATE PARTITION COEFFICIENTS Abstract Only **c46**

A. Holzheid, A. Borisov, and H. Palme *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 667-668 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

New, precise data on the solubilities of Ni, Co, and Mo in silicate melts at 1400 C and fO2 from IW to IW-2 are presented. The results suggest NiO, CoO as stable species in the melt. No evidence for metallic Ni or Co was found. Equilibrium was ensured by reversals with initially high Ni and Co in the glass. Mo appears to change oxidation state at IW-1, from MoO3 to MoO2. Metal-silicate partition coefficients calculated from these data and recent data on Pd indicate similar partition coefficients for Pd and Mo at the conditions of core formation. This unexpected result constrains models of core formation in the Earth. Author (revised)

GAS-GRAIN ENERGY TRANSFER IN SOLAR NEBULA SHOCK WAVES: IMPLICATIONS FOR THE ORIGIN OF CHONDRULES Abstract Only **c92**

L. L. Hood and M. Horanyi (Colorado Univ., Boulder.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 669-670 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Meteoritic chondrules provide evidence for the occurrence of rapid transient heating events in the protoplanetary nebula. Astronomical evidence suggests that gas dynamic shock waves are likely to be excited in protostellar accretion disks by processes such as protosolar mass ejections, nonaxisymmetric structures in an evolving disk, and impact on the nebula surface of infalling 'clumps' of circumstellar gas. Previous detailed calculations of gas-grain energy and momentum transfer have supported the possibility that such shock waves could have melted pre-existing chondrule-sized grains. The main requirement for grains to reach melting temperatures in shock waves with plausibly low Mach numbers is that grains existed in dust-rich zones (optical depth greater than 1) where radiative cooling of a given grain can be nearly balanced by radiation from surrounding grains. Localized dust-rich zones also provide a means of explaining the apparent small spatial scale of heating events. For example, the scale size of at least some optically thick dust-rich zones must have been relatively small (less than 10 kilometers) to be consistent with petrologic evidence for accretion of hot material onto cold chondrules. The implied number density of mm-sized grains for these zones would be greater than 30 m(exp -3). In this paper, we make several improvements of our earlier calculations to include radiation self-consistently in the shock jump conditions, and we include heating of grains due to radiation from the

shocked gas. In addition, we estimate the importance of momentum feedback of dust concentrations onto the shocked gas which would tend to reduce the efficiency of gas dynamic heating of grains in the center of the dust cloud. Author (revised)

MASS OF SATURN'S A RING Abstract Only
L. J. Horn and C. T. Russell (California Univ., Los Angeles.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 671-672 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The mass of Saturn's A ring is reestimated using the behavior of spiral density waves embedded in the ring. The Voyager photopolarimeter (PPS) observed the star delta-Scorpii as it was occulted by Saturn's rings during the Voyager 2 flyby of Saturn in 1981 producing a radial profile of the rings. We examined forty spiral density waves in the Voyager PPS data of the A ring including 10 weaker waves that have not been previously analyzed by means of an autoregressive power spectral technique called Burg. The strengths of this new method for ring studies are that weaker, less extended waves are easily detected and characterized. This method is also the first one which does not require precise knowledge of the resonance location and phase of the wave in order to calculate the surface mass density. Uncertainties of up to 3 km are present in the currently available radial scales for Saturn's rings. Author (revised)

Avail: CASI HC A01/MF A06

Approximately 20.4 sq m of Teflon thermal blankets on the nonspinning Long Duration Exposure Facility (LDEF) were exposed to the orbital debris and micrometeoroid environment in low-Earth orbit (LEO) for approximately 5.7 years. Each blanket consisted of an outer layer (approximately 125 micron thick) of FEP Teflon that was backed by a vapor-deposited metal mirror (Inconel; less than 1 micron thick). The inner surface consisted of organic binders and Chemglaze thermal protective paint (approximately 50 micron thick) resulting in a somewhat variable, total blanket thickness of approximately 180 to 200 microns. There was at least one of these blankets, each exposing approximately 1.2 sq m of surface area, on nine of LDEF's 12 principal pointing directions, the exceptions being Rows 3, 9, and 12. As a consequence, these blankets represent a significant opportunity for micrometeoroid and debris studies, in general, and specifically they provide an opportunity to address those issues that require information about pointing direction (i.e., spatial density of impact events as a function of instrument orientation). During deintegration of the LDEF spacecraft at KSC, all penetration holes greater than or equal to 300 micron in diameter were documented and were recently synthesized in terms of spatial density as a function of LDEF viewing direction by. The present report describes ongoing cratering and penetration experiments in pure Teflon targets, which are intended to establish the relationships between crater or penetration-hole diameters and the associated projectile dimensions at laboratory velocities (i.e., 6 km/s). The ultimate objective of these efforts is to extract reliable mass-frequencies and associated fluxes of hypervelocity particles in LEO. Author (revised)

SIMULATION OF COLLISIONAL FRAGMENTATION WITH EXPLOSIVES Abstract Only **c39**
Kevin Housen *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 675-676 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

For practical reasons, experimental studies of collisional fragmentation must at times rely on explosives to fragment a target body. For example, Housen et al., described experiments in which spheres were fragmented in a pressurized atmosphere. Explosives were used because impacts could not be performed in the pressure chamber. Explosives can also be used to study targets much larger than those which can be disrupted by conventional light-gas guns, thereby allowing size- and rate-effects to be investigated. The purpose of this study is to determine the charge burial depth required to simulate various aspects of collisions. Author (revised)

OLIVINES IN THE KABA CARBONACEOUS CHONDRITE AND CONSTRAINTS ON THEIR FORMATION Abstract Only **c76**
X. Hua and P. R. Buseck *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 677-678 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Kaba is unique in containing almost pure fayalitic olivine (Fo(sub 0.1)). Its coexistence with pure forsterite up to Fo(sub 99.6) and normal (Fo(sub 92) to Fo(sub 59)) and reversely (Fo(sub 0.4) to Fo(sub 4.7)) zoned olivines suggest that the Kaba olivines are in thermodynamic disequilibrium and experienced a complicated history. The fayalite is sufficiently pure that it is unlikely that it could have been produced by fractional crystallization. A gas-solid reaction under oxidizing conditions (H2O/H2 ratio approximately 10) is probably responsible for its formation. Author (revised)

REMOVAL OF CARBONACEOUS CONTAMINANTS FROM SILICA AEROGEL Abstract Only **c25**
Hui-Ping Huang, I. Gilmour, C. T. Pillinger, and M. E. Zolensky (National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, TX.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 679-680 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Capture of micrometeorite material from low Earth orbit or dust grains around active comets for return to terrestrial laboratories, capable of practicing the most up to date techniques of chemical isotopic and mineralogical analysis, will greatly enhance our knowledge of primitive material in the solar system. The next generation of space launched cosmic dust collectors will undoubtedly include extremely low density target materials such as silica aerogel as the decelerating and arresting medium. This material has been found to be clean from the point of view of inorganic elements and is thus acceptable for the purpose of harvesting grains to be studied by, for example PIXE, INAA, or SXRF. However, the process used in making aerogel leaves substantial carbon and hydrogen containing residues which would negate their suitability for collection and subsequent investigation of the very important CHON particles. Attempts to precondition aerogel by solvent extraction or heating at 500 C and 750 C in air for 24 hours or under a vacuum of 2(7)(exp -7) torr at 260 C were largely ineffective except that pyrolysis did reduce volatile species. In this investigation we have examined the use of supercritical fluids for the purpose of extracting organic residues. The logic of the new approach is that beyond the supercritical point a substance has the solvating properties of a liquid but the viscosity characteristics of a gas. For example carbon dioxide becomes supercritical at a pressure of 73 atmospheres and a temperature of 31 C; in consequence it can transform to a very powerful and ultraclean solvent. It can dissolve organic matter from low molecular weight up to molecules containing 90 carbon atoms. On release of pressure the fluid reverts to a gas which can easily be pumped away and removed from the substrate being extracted. Author (revised)

THE GROUP A3 CHONDRULES OF KRYMKA: FURTHER EVIDENCE FOR MAJOR EVAPORATIVE LOSS DURING THE FORMATION OF CHONDRULES Abstract Only **c90**
S. Huang, P. H. Benoit, and D. W. G. Sears *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 681-682 (For primary document see N94-16173 03-91)
(Grant NAG9-81)
Avail: CASI HC A01/MF A06

Like Semarkona (type 3.0), Krymka (type 3.1) contains two distinct types of chondrule (namely groups A and B) which differ in their bulk compositions, phase compositions, and CL properties. The group A

chondrules in both meteorites show evidence for major loss of material by evaporation(i.e. elemental abundance patterns, size, redox state, olivine-pyroxene abundances). Group A and B chondrules probably formed from common or very similar precursors by the same processes acting with different intensities, group A suffering greater mass-loss by evaporation and reduction of FeO and SiO2. While Krymka chondrules share many primary mineralogical and compositional properties with Semarkona chondrules, the minimal metamorphism it has suffered has also had a significant effect on its chondrules. PETROLOGIC MODELS OF 15388, A UNIQUE APOLLO 15 MARE BASALT Abstract Only
S. S. Hughes, E. J. Dasch (National Aeronautics and Space Administration, Washington, DC.), and L. E. Nyquist (National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, TX.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 683-684 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Mare basalt 15388, a feldspathic microgabbro from the Apennine Front, is chemically and petrographically distinct from Apollo 15 picritic, olivine-normative (ON), and quartz-normative basalts. The evolved chemistry, coarse texture, lack of olivine, and occurrence of cristobalite in 15388 argue for derivation by a late-stage magmatic process that is significantly removed from parental magma. It either crystallized from a magma evolved from the more mafic Apollo 15 basalts, or it crystallized from a currently unrepresented magma. Rb-Sr and Sm-Nd isotopic systematics yield isochron ages of 3.391 plus or minus 0.036 and 3.42 plus or minus 0.07 Ga, respectively, and epsilon(sub Nd) = 8.6 plus or minus 2.4, which is relatively high for Apollo 15 mare basalts. In contrast to chemical patterns of average Apollo 15 ON basalts and Apollo 15 picritic basalt, 15388 has a strongly positive LREE slope, high Ti, shallower HREE slope and a slightly positive Eu anomaly. These features argue against 15388 evolution by simple olivine fractionation of a parental ON or picritic basalt magma, although olivine is a dominant liquidus phase in both potential parents. POTASSIUM ISOTOPE COSMOCHEMISTRY, VOLATILE DEPLETION AND THE ORIGIN OF THE EARTH Abstract Only **c25**
M. Humayun and R. N. Clayton *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 685-686 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

We report the first results obtained by our techniques for the precise and accurate determination of the isotopic composition of potassium to constrain the mechanism of volatile element depletion in the formation of the Earth, Moon, and meteorites. Our measurements of delta(K-41) for six chondrites and ten terrestrial rocks attained an average precision of the individual measurement of plus or minus 0.4 percent (2 sigma; plus or minus 0.2 percent/a.m.u. and yield a net chondrite-Earth difference unresolved at the 99 percent confidence limit, delta(K-41) = 0.32 plus or minus 0.35 percent (3 delta). This sets a firm upper limit of 1.3 plus or minus 1.4 percent Rayleigh evaporation of terrestrial potassium (using alpha = square root of 41/39), compared with an observed approximately equals 85 percent chemical depletion of K relative to C1 chondrites. Similar conclusions are reached for the SNC meteorites, Shergotty and Zagami, for 15495 (lunar mare gabbro), and for the eucrite Juvinas. Our conclusion is that direct evaporation of volatile elements from planets (e.g. from silicate vapor atmospheres following giant impact) can be ruled out, and the cause of volatile loss must be sought elsewhere, e.g. nebular processes. Our present findings do not support the conclusions of Hinton et al., the discrepancy to be resolved at a later date. We also find lunar soil 64801, delta(K-41) = +4.99 plus or minus 0.53 percent, to be distinctly heavy in accord with Garner et al. Author (revised)

DO SIC GRAINS IN ORGUEIL DIFFER FROM THOSE IN MURCHISON? Abstract Only **c90**
Gary R. Huss, Ian D. Hutcheon, and G. J. Wasserburg *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 687-688 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Studies of individual presolar SiC grains have shown that most are enriched in Si-29, Si-30, and C-13, and depleted in N-15, compared to solar-system abundances and that many have large excesses of Mg-26, most plausibly from in situ decay of Al-26. Stone et al., observed that Si from a family of platy SiC grains define a linear array on a 3-isotope plot that does not pass through normal solar-system Si. In contrast, Si-isotope data from over 100 3-4 micron SiC grains from Murchison from an elongate ellipse enclosing the Stone et al. linear array but also including 'normal' solar-system Si. To investigate whether this difference in Si isotopes indicates different populations of SiC in the two meteorites and to improve the characterization of Orgueil SiC, we used the PANURGE ion microprobe to measure Si, C, N, and Mg isotopes and Al and Na concentrations in a suite of 2-5 micron SiC grains from a new sample of Orgueil. THE DEPTHS OF THE LARGEST IMPACT CRATERS ON VENUS Abstract Only
B. A. Ivanov and P. G. Ford (Massachusetts Inst. of Tech., Cambridge.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 689-690 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The largest impact craters on Venus may be used as evidence of various geological processes within the Venusian crust. We are continuing to construct a data base for the further investigation of large craters on Venus (LCV). We hope to find evidence of crater relaxation that might constrain the thickness and thermal gradient of the crust, as was proposed in an earlier work. The current work concentrates on 27 impact craters with diameters (d) larger than 70 km, i.e., large enough that the footprint of the Magellan altimeter has a good chance of sampling the true crater bottom. All altimeter echoes from points located within (d/2)+70 km from the crater center have been inspected. Author (revised)

TESSERA TERRAIN ON VENUS: GLOBAL CHARACTERIZATION FROM MAGELLAN DATA Abstract Only
Mikhail Ivanov and James W. Head (Brown Univ., Providence, RI.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 691-692 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Tessera terrain is characterized by relatively high elevations and complex tectonic patterns; analysis of Venera 15/16 data showed that large (up to thousands of km across) and small (up to hundreds of km across) occurrences of tesserae are widespread and non-randomly distributed and make up about 10-15 percent of the surface of Venus north of approximately 30 deg N. In a previous analysis, we used the Magellan Cycle 1 and 2 data to map the global distribution of tesserae on the basis of the following: (1) complex deformational patterns (two or more trends); (2) relatively high radar backscatter; and (3) relatively high elevation. Here we report on the quantitative aspects of tesserae areal, size, and shape distribution and on the characteristics and distribution of tesserae boundaries. Experiments on volcanic flooding of tessera and implications for tessera presence beneath the plains and analysis of the distribution of impact craters on tesserae and the plains are reported elsewhere. DENSITY OF IMPACT CRATERS ON TESSERA, VENUS Abstract Only
M. A. Ivanov and A. T. Basilevsky (Brown Univ., Providence, RI.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 693-694 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

After the plains, tessera is the most abundant terrain on Venus. It occupies about 10 percent of the Venusian surface, forming the continent-like blocks and small islands above the adjacent plains. Tessera is a result of tectonic deformations of some precursor terrain. However, the nature of

that precursor, as well as the causes and mechanisms of its formations, are under debate. Any models considering tessera terrain involve estimation of tessera age, either relative or absolute. It is well known that the important information on the age of a planetary surface comes from impact crater statistics. The Magellan global overview of Venus with improved resolution provides an opportunity to gather data on impact craters in amounts large enough for statistically reliable estimations of crater density for different terrains. Our study of impact crater density on tesserae compared to the surrounding terrains has a goal to determine whether it is higher, lower, or the same and to interpret it in terms of the tessera age and processes involved. The Dengli (H3,8) meteorite, which weighs 243.5 g, is a find from the Karakum desert. It is a complex microbreccia containing unusual clasts which are more typical for regolithic breccias than for H-chondrites. Based on comparisons of Xe and Kr content and isotopic composition, the Dengli does not differ significantly from other H-chondrites. Its exposure age is 7.6 Ma. That is in agreement with common data for the exposure age (6.2 + 0.2 Ma) of 350 H-chondrites. Dengli's K/Ar age (4.01 Ga) coincides with the same ages of many other H-chondrites. Thus the Dengli is not regolithic breccia, and it probably formed during accretion of its parent body. Author (revised)

SILICA-BEARING OBJECTS IN THE DENGLI H3.8 AND GORLOVKA H3-4 CHONDRITES Abstract Only **c90**

M. A. Ivanova, N. N. Kononkova, and M. I. Petaev *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 697-698 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Silica-bearing objects are enigmatic components of the olivine-normative ordinary chondrites. Several papers have been devoted to the study of these objects in various chondrite types. While a relatively large body of information has been collected, the origin of these objects is still controversial. Here we report new data on silica-bearing objects in the unequilibrated H-chondrites Dengli and Gorlovka. The crystallization history of these objects could be explained on the basis of the phase diagram of the Q-Ol-Pl (Al_2O_3) system, but the origin of the silica-rich liquids remains unclear. INDUCED THERMOLUMINESCENCE STUDY OF EXPERIMENTALLY SHOCK-LOADED OLIGOCLASE Abstract Only **c25**

A. I. Ivliev, L. L. Kashkarov, and D. D. Badjukov *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 699-700 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Artificially induced thermoluminescence (TL) in oligoclase samples which were shock-loaded up to 27 GPa was measured. The essential increase of the TL sensitivity in relation to the total gamma-ray irradiation dose was observed only in samples at the 27 GPa pressure. This result can be explained by the initiation of additional radiation damages in the shocked oligoclace crystal lattice. Author (revised)

SHOCK-THERMAL HISTORY OF KAPOETA HOWARDITE MATTER ON DATA OF THERMOLUMINESCENCE ANALYSIS OF INDIVIDUAL MINERAL GRAINS Abstract Only **c25**

A. I. Ivliev, L. L. Kashkarov, and Yu. Yu. Korotkova (Moscow State Univ., Russia.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 701-702 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The artificially induced thermoluminescence (TL) was measured in OPx grains from Kapoeta howardite. The TL glow curves for individual OPx grains are significantly distinguished from each other both by their shape and TL sensitivity; five groups of OPx grains were characterized. The observed variety of glow curves of OPx grains could be caused by their distinct shock-thermal events at the regolith stage of meteorite parent body formation. Author (revised)

A FIRST-ORDER MODEL FOR IMPACT CRATER DEGRADATION ON VENUS Abstract Only

Noam R. Izenberg, Raymond E. Arvidson, and Roger J. Phillips *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 703-704 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

A first-order impact crater aging model is presented based on observations of the global crater population of Venus. The total population consists of 879 craters found over the approximately 98 percent of the planet that has been mapped by the Magellan spacecraft during the first three cycles of its mission. The model is based upon three primary aspects of venusian impact craters: (1) extended ejecta deposits (EED's); (2) crater rims and continuous ejecta deposits; and (3) crater interiors and floors. A DISCONTINUOUS MELT SHEET IN THE MANSON IMPACT STRUCTURE Abstract Only **c46**

G. A. Izett, R. L. Reynolds, J. G. Rosenbaum, and J. M. Nishi *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 705-706 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Petrologic studies of the core recovered from holes drilled in the Manson, Iowa, buried impact structure may unravel the thermal history of the crater-fill debris. We made a cursory examination of about 200 m of core recovered from the M-1 bore hole. The M-1 bore hole was the first of 12 holes drilled as part of a cooperative drilling program between the U.S. Geological Survey and the Iowa Geological Survey Bureau. The M-1 core hole is about 6 km northeast of the center of the impact structure, apparently on the flank of its central peak. We developed a working hypothesis that a 30-m-thick breccia unit within a 53-m-thick unit previously termed the 'crystalline clast breccia with glassy matrix' is part of a discontinuous melt sheet in the crater-fill impact debris. The 30-m-thick breccia unit reached temperatures sufficient to partially melt some small breccia clasts and convert the fine-grained breccia matrix into a silicate melt that cooled to a greenish-black, flinty, microcrystalline rock. The results of the investigation of this unit are presented. Author (revised)

ORBITAL EVOLUTION OF DUST FROM COMET SCHWASSMANN-WACHMANN 1: A CASE OF ONE-TO-ONE RESONANCE TRAPPING Abstract Only **c90**

A. A. Jackson and H. A. Zook (National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, TX.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 707-708 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

In a recent study we have modeled the orbital evolution of dust particles released from comets and asteroids in the solar system. The source bodies were either asteroids inside Jupiter's orbit or comets from the Jupiter family of comets. However there are other dust producing parent bodies in the solar system of interest, one of these is comet P/Schwassman-Wachmann 1. Since comet Schwassman-Wachmann 1, which has an orbit outside of Jupiter's orbit, is an active dust producer

and has low eccentricity, dust particle evolution from it is of interest. We report on a particular 2 micron radius particle that captured into a 1 to 1 mean motion resonance orbit with Saturn. Author (revised)

CONSTRAINTS ON THE DIFFERENTIATION OF THE EARTH FROM THE COUPLED Sm-146,147-Nd-142,143 SYSTEMATICS Abstract Only **c46**

S. B. Jacobsen and C. L. Harper, Jr. *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 709-710 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The coupled Sm-Nd systematics are a powerful (albeit analytically challenging) tool for investigating the geodynamic history of the Earth. We have previously reported evidence for a 33 ppm difference of an Isua sample relative to our terrestrial standard. Interpretation yields a formation age range for the depleted mantle (DM) source reservoir of 4.45-4.55 Ga. This is consistent with an epoch of LREE-enriched melt extraction from the mantle (proto-crust formation), soon after magma ocean freeze-up following the putative Moon forming giant impact. Os ISOTOPES IN SNC METEORITES AND THEIR IMPLICATIONS TO THE EARLY EVOLUTION OF MARS AND EARTH **c90**

E. Jagoutz, J. M. Luck (Montpellier Univ., France.), D. Ben Othman (Montpellier Univ., France.), and H. Wanke *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 711-712 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

A new development on the measurement of the Os isotopic composition by mass spectrometry using negative ions opened a new field of applications. The Re-Os systematic provides time information on the differentiation of the nobel metals. The nobel metals are strongly partitioned into metal and sulphide phases, but also the generation of silicate melts might fractionate the Re-Os system. Compared to the other isotopic systems which are mainly dating the fractionation of the alkalis and alkali-earth elements, the Re-Os system is expected to disclose entirely new information about the geochemistry. Especially the differentiation and early evolution of the planets such as the formation of the core will be elucidated with this method.

TRANSITION METALS IN SUPERHEAT MELTS Abstract Only **c26**

Petr Jakes and Michael-Patrick Wolfbauer (Bemidji State Univ., MN.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 713-714 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

A series of experiments with silicate melts doped with transition element oxides was carried out at atmospheric pressures of inert gas at temperatures exceeding liquidus. As predicted from the shape of fO2 buffer curves in T-fO2 diagrams the reducing conditions for a particular oxide-metal pair can be achieved through the T increase if the released oxygen is continuously removed. Experimental studies suggest that transition metals such as Cr or V behave as siderophile elements at temperatures exceeding liquidus temperatures if the system is not buffered by the presence of other oxide of more siderophile element. For example the presence of FeO prevents the reduction of Cr2O3. The sequence of decreasing siderophility of transition elements at superheat conditions (Mo, Ni, Fe, Cr) matches the decreasing degree of depletion of siderophile elements in mantle rocks as compared to chondrites. IRON OXIDE BANDS IN THE VISIBLE AND NEAR-INFRARED REFLECTANCE SPECTRA OF PRIMITIVE ASTEROIDS Abstract Only **c90**

Kandy S. Jarvis, Faith Vilas (National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, TX.), and Michael J. Gaffey (Rensselaer Polytechnic Inst., Troy, NY.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 715-716 (For primary document see N94-16173 03-91)
(Grant NAGw-642)
Avail: CASI HC A01/MF A06

High resolution reflectance spectra of primitive asteroids (C, P, and D class and associated subclasses) have commonly revealed an absorption feature centered at 0.7 microns attributed to an Fe(2+)-Fe(3+) charge transfer transition in iron oxides and/or oxidized iron in phyllosilicates. A smaller feature identified at 0.43 microns has been attributed to an Fe(3+) spin-forbidden transition in iron oxides. In the spectra of the two main-belt primitive asteroids 368 Haidea (D) and 877 Walkure (F), weak absorption features which were centered near the location of 0.60-0.65 microns and 0.80-0.90 microns prompted a search for features at these wavelengths and an attempt to identify their origin(s). The CCD reflectance spectra obtained between 1982-1992 were reviewed for similar absorption features located near these wavelengths. The spectra of asteroids in which these absorption features have been identified are shown. These spectra are plotted in order of increasing heliocentric distance. No division of the asteroids by class has been attempted here (although the absence of these features in the anhydrous S-class asteroids, many of which have presumably undergone full heating and differentiation should be noted). For this study, each spectrum was treated as a continuum with discrete absorption features superimposed on it. For each object, a linear least squares fit to the data points defined a simple linear continuum. The linear continuum was then divided into each spectrum, thus removing the sloped continuum and permitting the intercomparison of residual spectral features.

SEARCHING FOR neuKREEP: AN EMP STUDY OF APOLLO 11 GROUP A BASALTS Abstract Only

Eric A. Jerde and Lawrence A. Taylor *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 717-718 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The Apollo 11 and 17 landing sites are characterized by the presence of high-Ti basalts (TiO2 greater than 6 percent). The Group A basalts of Apollo 11 have elevated K compositions (greater than 2000 ppm); and are enriched in incompatible trace elements relative to the other types of high-Ti basalt found in the region. These unique basalts also are the youngest of all high-Ti basalts, with an age of 3.56 +/- 0.02 Ga. Recent modelling of the Apollo 11 Group A basalts by Jerde et al. has demonstrated that this unique variety of high-Ti basalt may have formed through fractionation of a liquid with the composition of the Apollo 11 orange glass, coupled with assimilation of evolved material (dubbed neuKREEP and having similarities to lunar quartz monzodiorite). Assimilation of this material would impart its REE signature on the liquid, resulting in the elevated REE abundances observed. Minerals such as whitlockite which contain a large portion of the REE budget can be expected to reflect the REE characteristics of the assimilant. To this end, an examination of the whitlockite present in the Apollo 11 Group A basalts was undertaken to search for evidence of the neuKREEP material assimilated.

ON THE COMPOSITION OF neuKREEP: QMD CONTAMINATION AT APOLLO 11? Abstract Only

Eric A. Jerde, Gregory A. Snyder, and Lawrence A. Taylor *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 719-720 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The Group A basalts of Apollo 11 differ in many respects from other high-Ti basalts of the region. Chemically, they are the only high-K (greater than 2000 ppm K) variety of high-Ti basalt and are enriched in incompatible trace elements relative to other basalts from both the Apollo 11 and Apollo 17 sites. In addition, Group A basalts are the youngest of all high-Ti basalts, with an age of 3.56 +/- 0.02 Ga. The cluster of compositions is consistent with the Apollo 11 Group A basalts representing a single flow. Papanastassiou et al. have also indicated the uniqueness of these basalts, based particularly on relatively young Rb-Sr model ages (3.8 - 3.9 Ga). A model for the formation of the Group A basalts was presented by Jerde et al., wherein the Apollo 17 orange volcanic glass is the parent

liquid. Fractionation of this composition, coupled with the assimilation of incompatible-element-rich material, results in compositions akin to those of the Apollo 11 Group A basalt population. Orange glass of similar major-element composition is present at the Apollo 11 site as well, although complete trace element analyses are not available. New modelling results using the Apollo 11 orange glass major elements are grossly similar to those obtained using the Apollo 17 orange glass, indicating approximately 30 percent fractionation. ESTIMATES OF LITHOSPHERIC THICKNESS ON VENUS Abstract Only
C. L. Johnson and D. T. Sandwell *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 721-722 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Magellan altimetry data have revealed many examples of topographic flexure on Venus. Modeling of flexural features is of interest as it provides information on spatial (and for the earth, temporal) variations in lithospheric thickness. Lithospheric thickness may be determined solely from modeling topographic flexure or by combining gravity and topography data. On Venus even the highest resolution gravity is insufficient for modeling all but the very longest wavelength flexural features, so we rely heavily on altimetry data for information about lithospheric thickness. Sandwell and Schubert modeled flexure around four coronae and found lithospheric thicknesses h, in the range 35 - 70 km. Studies of several more flexural features suggests that these are typical of Aphrodite Terra and other chasmata regions on Venus. However lithospheric thicknesses associated with other regions are in the range 15-30 km. McKenzie et al. noted that part of Aphrodite Terra appeared similar in planform and morphology to the subduction zones of the East Indies on Earth. Other flexure studies using Magellan data have looked at smaller coronae (h = 5-30 km) and rifts (h = 8-20 km). It can be seen that the range of thicknesses suggested by studies to date is extremely large, and it is difficult to establish whether their mean is in agreement with that predicted by heat flow scaling arguments (h approximately 18 km). Here we present results from a global study of flexure on Venus, with particular emphasis on the variation in our results with different tectonic settings. Author (revised)

RADAR PROPERTIES OF SEVERAL FLUIDIZED EJECTA BLANKETS ON VENUS Abstract Only
J. R. Johnson and V. R. Baker *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 723-724 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Magellan SAR imagery, altimetry, and radiometry are being analyzed to characterize the radar properties of the fluidized ejecta blankets (FEB's) that are associated with over 40 percent of the impact craters on Venus. The FEB flows and plains units surrounding the craters Isabella (175 km), Addams (90 km), Seymore (65 km), and a crater located at 4 S, 155.5 E (70 km) are examined here using the MIT-produced ARCDR and GxDR data. Individual orbital footprints obtained from the ARCDR's have been classified according to their dominant simple geologic unit (e.g., plains, FEB flows). This permits average values of reflectivity (corrected for diffuse scattering), rms meter-scale slopes, emissivity, and SAR backscatter to be calculated for each unit. GxDR images provide a means of visualizing the spatial relations between the various data sets. Variability of radar properties within the FEB's and relative to surrounding regions may have implications concerning the genesis and possible emplacement mechanisms of fluidized ejecta. A MONAZITE-BEARING CLAST IN APOLLO 17 MELT BRECCIA Abstract Only
Bradley L. Jolliff *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 725-726 (For primary document see N94-16173 03-91)
(Grant NAG9-56)
Avail: CASI HC A01/MF A06

A phosphate-rich clast in a pigeonite-plagioclase mineral assemblage occurs in Apollo 17 impact-melt breccia 76503,7025. The clast, measuring 0.9 x 0.4 mm in thin section, contains 3.3 percent (volume) apatite ($Ca_5P_3O_{12}(F,Cl)$), 0.8 percent whitlockite ($Ca_{16}(Mg,Fe)_2REE_2P_{14}O_{56}$), and trace monazite ((LREE)PO_4). Major minerals include 26 percent pigeonite, En53-57FS34-35W08-13, and 69 percent plagioclase, An84-92Ab7-15Oro.6-1.1. Troilite, ilmenite, and other accessory minerals constitute less than 1 percent of the assemblage and Fe-metal occurs along fractures. Also present in the melt breccia as a separate clast is a fragment of felsite. Based on the association of these clasts and their assemblages, a parent lithology of alkali-anorthositic monzogabbro is postulated. Monazite occurs in the phosphate-bearing clast as two less than 10 micron grains intergrown with whitlockite. The concentration of combined REE oxides in monazite is 63.5 percent and the chondrite-normalized REE pattern is strongly enriched in LREE, similar to lunar monazite in 10047,68 and terrestrial monazite. Thorium concentration was not measured in monazite, but based on oxide analyses of approximately 100 percent (including interpolated values for REE not measured), substantial Th concentration is not indicated, similar to monazite in 10047,68. Measured monazite/whitlockite REE ratios are La: 11, Ce: 8, Sm: 3.6, Y: 0.9, and Yb: 0.5. Compositions of monazite and coexisting whitlockite and apatite are given. Author

APOLLO 17 MATERIALS VIEWED FROM 2 TO 4 mm SOIL PARTICLES: PRE-SERENITATIS HIGHLANDS COMPONENTS Abstract Only
Bradley L. Jolliff and Kaylynn M. Bishop *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 727-728 (For primary document see N94-16173 03-91)
(Grant NAG9-56)
Avail: CASI HC A01/MF A06

Among the highland lithologies of 2-4 mm rock fragments in North Massif soil 76503, we have found a compositional group, low in incompatible element concentrations, that we interpret as representing the pre-Serenitatis surface. A component of these materials is an igneous-textured lithology that we believe formed in large impact melts. These are compositionally similar to, and possibly precursors of, many of the granulitic breccias that appear to be mixtures of ferroan and magnesian-suite rocks. The polymict, or old, upper-crustal breccias, along with granulitic breccias and the endogenous igneous lithologies found particularly at the North Massif stations, constitute the poorly consolidated portions of North Massif. Highland samples from the South Massif, on the other hand, are enriched in materials of the competent, impact-melt breccias formed by the Serenitatis impact. The competent melt-breccias contain clasts of most of the pre-existing surface materials, but they also contain components not found in the rocks of the poorly consolidated massif materials. Author

AN IRIDIUM-RICH IRON MICROMETEORITE WITH SILICATE INCLUSIONS FROM THE MOON Abstract Only **c90**
Bradley L. Jolliff, Randy L. Korotev, and Larry A. Haskin *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 729-730 (For primary document see N94-16173 03-91)
(Grant NAG9-56)
Avail: CASI HC A01/MF A06

We have found a 0.1 mg iron micrometeorite containing meteoritic silicate inclusions in an agglutinate from 2-2.5 cm deep in regolith core 60014. The metal is 93 percent iron, 6.5 percent nickel, 0.5 percent cobalt, approximately 150 ppm iridium, and less than 2 ppm gold. Although the Ir concentration is higher than that reported previously for any iron meteorite group, it lies on the extrapolation to low Ni and high Ir concentrations of several meteorite groups on Ni,Ir plots (groups 2C,D,E, and 3AB,E,F). Tiny, subrounded silicate inclusions comprise low-Ca pyroxene (En83), olivine (FO80), and albitic and potassic feldspars, as mixtures of minerals or glasses. Minor phases include oldhamite (CaS) and, tentatively, hercynite ($FeAl_2O_4$). The inclusions have pyroxene FeO/MnO of approximately 25 and olivine FeO/MnO of 40-60. In comparison with known iron meteorites, the inclusions are most similar to those in type 2E, e.g., Weekeroo Station, Colomera, and Kodaikanal. As far as we know, this is the first observation of an iron meteorite with silicate inclusions from a lunar sample. No metal

fragments with meteoritic, nonmetallic inclusions were reported in several previous, exhaustive studies of soil particles. Author (revised)

THE COOLING RATES OF PAHOEHOE FLOWS: THE IMPORTANCE OF LAVA POROSITY Abstract Only **c46**
Alun C. Jones *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 731-732 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Many theoretical models have been put forward to account for the cooling history of a lava flow; however, only limited detailed field data exist to validate these models. To accurately model the cooling of lava flows, data are required, not only on the heat loss mechanisms, but also on the surface skin development and the causes of differing cooling rates. This paper argues that the cause of such variations in the cooling rates are attributed, primarily, to the vesicle content and degassing history of the lava. Author (revised)

PARTITIONING OF Nb, Mo, Ba, Ce, Pb, Th AND U BETWEEN IMMISCIBLE CARBONATE AND SILICATE LIQUIDS: EVALUATING THE EFFECTS OF P2O5,F, AND CARBONATE COMPOSITION Abstract Only **c25**
J. H. Jones and D. Walker (Lamont-Doherty Geological Observatory, Palisades, NY.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 733-734 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Previously we have reported carbonate liq./silicate liq. partition coefficients (D) for a standard suite of trace elements (Nb, Mo, Ba, Ce, Pb, Th, and U) and Ra and Pa as well. In brief, we have found that immiscible liquid partitioning is a strong function of temperature. As the critical temperature of the carbonate-silicate solvus is approached, all partition coefficients approach unity. Additionally, for the overwhelming majority of the partitioning elements, lnD is a linear function of 'ionic field strength,' z/r, where z is the charge of the partitioned cation and r is its ionic radius. COMPLEX ZONING BEHAVIOR IN PYROXENE IN FeO-RICH CHONDRULES IN THE SEMARKONA ORDINARY CHONDRITE Abstract Only **c90**
Rhian H. Jones and J. J. Papike *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 735-736 (For primary document see N94-16173 03-91)
(Grant NAG9-497)
Avail: CASI HC A01/MF A06

A detailed understanding of the properties of silicate minerals in chondrules is essential to the interpretation of chondrule formation conditions. This study is further work in a series of petrologic studies of chondrules in the least equilibrated LL chondrite, Semarkona (LL3.0). The objectives of this work are as follows: (1) to understand chondrule formation conditions and nebular processes; and (2) to use the data as a basis for understanding the effects of metamorphism in more equilibrated chondrites. FeO-rich pyroxene in the chondrules described shows complex zoning behavior. Low-Ca clinopyroxene, orthopyroxene, pigeonite, and augite are all observed, in various associations with one another. Coexisting olivine phenocrysts are also FeO-rich and strongly zoned. Compositional and zoning properties are similar to those observed in boninites and are interpreted as resulting from rapid cooling of individual chondrules. Author (revised)

ANGRITE LEW87051: ARE THE OLIVINES PHENO'S OR XENO'S? A CONTINUING STORY Abstract Only **c46**
A. J. G. Jurewicz and G. A. McKay (National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, TX.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 737-738 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The achondrite LEW87051 is a porphyritic basalt consisting of large subhedral to euhedral zoned olivines in a finer-grained groundmass. The texture of this groundmass looks remarkably like a quenched melt. However, although the rock is clearly igneous, its exact origins and history are under dispute. From petrographic observations, Prinz felt that the large olivines were xenocrysts and that the zoning reflected interaction with an unrelated, CAI-enriched melt. McKay et al. was able to model the olivines as phenocrysts, whose zoning was the result of a parent melt that changed in composition as material crystallized, e.g., fractional crystallization in a closed system, and calculated a parent melt composition. Jurewicz and McKay compared the calculated parent melt composition with actual partial melts from CV and CM chondrites. They showed that the calculated melt was substantially different from equilibrium melts of these chondrites; however, the LEW87051 groundmass composition was similar to some of the low temperature partial melts, although slightly enriched in AN (or depleted in OL) components. This study presents the results of an independent petrologic look at other olivines in LEW87051 and the preliminary results of a quantitative model for the major zoning in these olivines as diffusive-exchange with an olivine-saturated, low temperature angritic melt. Eucrites and diogenites are examples of asteroidal basalts and orthopyroxenites, respectively. As they are found intermingled in howardites, which are inferred to be regolith breccias, eucrites and diogenites are thought to be genetically related. But the details of this relationship and of their individual origins remain controversial. Work by Jurewicz et al. showed that 1170-1180 C partial melts of the (anhydrous) Murchison (CM) chondrite have major element compositions extremely similar to primitive eucrites, such as Sioux County. However, the MnO contents of these melts were about half that of Sioux County, a problem for the simple partial melting model. In addition, partial melting of Murchison could not produce diogenites, because residual pyroxenes in the Murchison experiments were too Fe- and Ca-rich and were minor phases at all but the lowest temperatures. A parent magma for diogenites needs an expanded low-calcium pyroxene field. In their partial melting study of an L6 chondrite, Kushiro and Mysen found that ordinary chondrites did have an expanded low-Ca pyroxene field over that of CV chondrites (i.e., Allende), probably because ordinary chondrites have lower Mg/Si ratios. This study expands that of both Kushiro and Mysen and Jurewicz et al. to the Lost City (H) and St. Severin (LL) chondrites at temperatures ranging from 1170 to 1325 C, at an fO2 of one log unit below the iron-wuestite buffer (IW-1). EXPERIMENTAL PARTITIONING OF Zr, Ti, AND Nb BETWEEN SILICATE LIQUID AND A COMPLEX NOBLE METAL ALLOY AND THE PARTITIONING OF Ti BETWEEN PEROVSKITE AND PLATINUM METAL Abstract Only **c26**
Stephen R. Jurewicz and John H. Jones *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 741-742 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

El Goresy et al.'s observation of Nb, Zr, and Ta in refractory platinum metal nuggets (RPMN's) from Ca-Al-rich inclusions (CAI's) in the Allende meteorite led them to propose that these lithophile elements alloyed in the metallic state with noble metals in the early solar nebula. However, Grossman pointed out that the thermodynamic stability of Zr in the oxide phase is vastly greater than metallic Zr at estimated solar nebula conditions. Jones and Burnett suggested this discrepancy may be explained by the very

non-ideal behavior of some lithophile transition elements in noble metal solutions and/or intermetallic compounds. Subsequently, Fegley and Kornacki used thermodynamic data taken from the literature to predict the stability of several of these intermetallic compounds at estimated solar nebula conditions. Palme and Schmitt and Treiman et al. conducted experiments to quantify the partitioning behavior of certain lithophile elements between silicate liquid and Pt-metal. Although their results were somewhat variable, they did suggest that Zr partition coefficients were too small to explain the observed 'percent' levels in some RPMN's. Palme and Schmitt also observed large partition coefficients for Nb and Ta. No intermetallic phases were identified. Following the work of Treiman et al., Jurewicz and Jones performed experiments to examine Zr, Nb, and Ti partitioning near solar nebula conditions. Their results showed that Zr, Nb, and Ti all have an affinity for the platinum metal, with Nb and Ti having a very strong preference for the metal. The intermetallic phases (Zr,Fe)Pt3, (Nb,Fe)Pt3, and (Ti,Fe)Pt3 were identified. Curiously, although both experiments and calculations indicate that Ti should partition strongly into Pt-metal (possibly as TiPt3), no Ti has ever been observed in any RPMN's. Fegley and Kornacki also noticed this discrepancy and hypothesized that the Ti was stabilized in perovskite which is a common phase in Allende CAI's.

Speculation about the possible mechanisms for core formation in small asteroids raises more questions than answers. Petrologic evidence from iron meteorites, pallasites, and astronomical observations of M asteroids suggests that many small bodies were capable of core formation. Recent work by Taylor reviews the geochemical evidence and examines the possible physical/mechanical constraints on segregation processes. Taylor's evaluation suggests that extensive silicate partial melting (preferably 50 vol. percent or greater) is required before metal can segregate from the surrounding silicate and form a metal core. The arguments for large degrees of silicate partial melting are two-fold: (1) elemental trends in iron meteorites require that the metal was at is liquidus; and (2) experimental observations of metal/sulfide inclusions in partially molten silicate meteorites show that the metal/sulfide tends to form spherules in the liquid silicate due to surface tension effects. Taylor points out that for these metal spherules to sink through a silicate mush, high degrees of silicate partial melting are required to lower the silicate yield strength. Although some qualitative experimental data exists, little is actually known about the behavior of metals and liquid sulfides dispersed in silicate systems. In addition, we have been impressed with the ability of cumulative olivine to expel trapped liquid when placed in a thermal gradient. Consequently, we undertook to accomplish the following: (1) experimentally evaluate the potential for metal/sulfide/silicate segregation in a thermal gradient; and (2) obtain quantitative data of the wetting parameters of metal-sulfide melts among silicate grains.

Avail: CASI HC A01/MF A06

The eruptive history of mare basalts in the Orientale Basin has been studied, using Lunar Orbiter 4 high-resolution photographs, Zond 8 photographs, and recently acquired Galileo EM-1 multispectral images. This work represents a refined set of compositional data incorporating the use of a linear mixing model for mare compositions, crater count data, and a comprehensive morphologic analysis of Orientale Basin mare deposits. Evidence for multiple eruptive episodes has been found, with compositions ranging from medium- to high-Ti basalt (less than 4 to greater than 6 wt. percent TiO2). Eruptive styles included flood, rille-forming, and shield-forming eruptions. Impact crater densities of mare units in the Orientale Basin enable determination of the ages of these deposits, using the method of Neukum et al. Earliest eruptions of mare basalt in the basin occurred at greater than or equal to 3.80 Ga and the latest eruptions occurred at about 2.3-2.5 Ga. Hence, mare volcanism occurred over a period of nearly 1.5 Ga.

Although the classificational group 'CR' was first put forth by McSween more than 10 years ago, it included only the Al Rais and Renazzo meteorites. It has only been the relatively recent discovery of several CR-related chondrites in Antarctica and the Sahara that has provided the necessary research material for an extensive group description and classification. Some 22 separate specimens representing at least 6 falls are now purportedly members of the CR group. In light of all this new data, an old question can once again be raised as to whether or not Al Rais should be classified in the same distinct group as Renazzo. This paper explores that question.

We are planning to carry out systematic isotopic investigations of Ru, Mg, etc., in primordial samples. The investigations will be pursued in the context of a study of the pre-history of the solar system. It is hoped that the study will yield direct evidence for processes of nucleosynthesis in the pre-solar stage and detection of extinct radioactive nuclides. In this paper, we present the results of chemical compositions of acid residues obtained from three types of meteorites: Canyon Diablo (IA), Allende (CV3), and Nuevo Mercuro (H5); and the preliminary results of Ru isotopic compositions.

Liquid sulfur can form when metal-free C1 or C2 chondrites are heated. It may be obtained either by direct melting of native sulfur in disequilibrated C1 or C2 chondrites or by incongruent melting of pyrite and other sulfides in thermodynamically equilibrated rocks of the same composition. Hence, Lewis considered C2 chondrites to be the best meteoritic analog for Io's bulk composition. Metal-bearing C3 and ordinary chondrites are too chemically reduced to yield liquid sulfur and are not thought tc represent plausible analogs of Io's bulk composition. An important aspect of Lewis' work is that CaSO4 and MgSO4 are predicted to be important in Io. Real C1 and C2 chondrites contain averages of, respectively, 11 percent and 3 percent by mass of salts (plus water of hydration). The most abundant chondritic salts are magnesium and calcium sulfates, but other important components include sulfates of sodium, potassium, and nickel and carbonates of magnesium, calcium, and iron. It is widely accepted that chondritic salts are formed by low-temperature aqueous alteration. Even if Io originally did not contain salts, it is likely that aqueous alteration would have yielded several percent sulfates and carbonates. In any event, Io

probably contains sulfates and carbonates. This report presents the results of a model of differentiation of a simplified C2 chondrite-like composition that includes 1.92 percent MgSO4, 0.56 percent CaSO4, 0.53 percent CaCO3, and 0.094 percent elemental sulfur. The temperature of the model is gradually increased; ensuing fractional melting results in these components extruding or intruding at gravitationally stable levels in Io's crust. Relevant phase equilibria were reviewed. A deficiency of high-pressure phase equilibria renders the present model qualitative. Author (revised)

Among many indications of possible ancient Martian galciation are sinuous eskerlike ridges in southern Argyre Planitia and the Dorsa Argentea region. But, in photogeology, other interpretations are always possible, and what appears eskerlike to one set of eyes may appear quite different to another. Interpretations of these ridges are about as numerous as observers, who collectively have suggested nine distinct hypotheses. Martian sinuous ridges have been interpreted as wrinkle ridges, lava flows, igneous dikes, clastic dikes, linear sand dunes, spits or bars, examples of inverted stream topography, or glacial crevasse fill. With Mars Observer en route to Mars, the prospects for a narrowing of the debate are bright. The esker hypothesis will gain support if Mars Observer images show that the ridges contain boulders, that the ridges are layered and contain channel structures, that the ridges are modified by thermokarst, or that the ridges occur in close, logical associations with other glacial landforms such as flutes, oriented grooves, and moraines. In the meantime, the evidence presented below bolsters the esker hypothesis, challenges certain alternative ideas, and draws a tentative geomorphic connection between the sinuous ridges of Argyre and those of Dorsa Argentea. The rheologic properties of terrestrial lavas have been related to morphologic features of their flows, such as levees, banked surfaces, multilobate structures, and compressible folds. These features also have been used to determine rheologies and constrain the compositions of extraterrestrial flows. However, with rare exceptions, such features are not resolvable in Voyager images of the satellites of outer planets. Often only flow length and edge thickness of cryovolcanic flows can be measured reasonably accurately from Voyager images. The semiempirical lava-flow model presented here is a renewed effort to extract useful information from such measurements. Author

Avail: CASI HC A01/MF A06

Attempts to unravel the origin and evolution of the atmosphere and hydrosphere on Mars from isotopic data have been hampered by the impreciseness of the measurements made by the Viking Lander and by Earth-based telescopes. The SNC meteorites which are possibly pieces of the Martian surface offer a unique opportunity to obtain more precise estimates of the planet's volatile inventory and isotopic composition. Recently, we reported results on oxygen isotopes of water extracted by pyrolysis from samples of Shergotty, Zagami, Nakhla, Chassigny, Lafayette, and EETA-79001. Now we describe complementary results on the stable isotopic composition of carbon dioxide extracted simultaneously from those same samples. We will also report on C-14 abundances obtained by accelerator mass spectrometry (AMS) for some of these CO2 samples. Author (revised)

TECTONICS OF NEYTERKOB CORONA ON VENUS Abstract Only
K. Kauhanen *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 765-766 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Neyterkob double corona (50 deg N 202 deg) presents an area of corona-related interfering tectonic patterns which are formed in different phases of evolution of the corona and modified by regional stresses. Analyzing the patterns can reveal something about the coronal formation. Tectonic features form distinct units on topographic depressions, slopes, and volcanic flows extending over one radius of the corona. A remarkable amount of compressional features were found near the rim and related to interaction between adjacent coronae. Radial extension was mainly observed on a peculiar NE-SW trending high crossing the corona. Concentric fractures were found to the east partly connected to the lithospheric flexure. Tectonic features indicate movements of volcanic activity and modification of the area by more regional stresses. Author (revised)

IMPLICATIONS OF CRATER DISTRIBUTIONS ON VENUS Abstract Only
W. M. Kaula *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and

Planetary Science Conference. Part 2: G-M 1993 p 767-768 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The horizontal locations of craters on Venus are consistent with randomness. However, (1) randomness does not make crater counts useless for age indications; (2) consistency does not imply necessity or optimality; and (3) horizontal location is not the only reference frame against which to test models. Re (1), the apparent smallness of resurfacing areas means that a region on the order of one percent of the planet with a typical number of craters, 5-15, will have a range of feature ages of several 100 My. Re (2), models of resurfacing somewhat similar to Earth's can be found that are also consistent and more optimal than random: i.e., resurfacing occurring in clusters, that arise and die away in lime intervals on the order of 50 My. These agree with the observation that there are more areas of high crater density, and fewer of moderate density, than optimal for random. Re (3), 799 crater elevations were tested; there are more at low elevations and fewer at high elevations than optimal for random: i.e., 54.6 percent below the median. Only one of 40 random sets of 799 was as extreme.

MEGAPLUMES ON VENUS Abstract Only
W. M. Kaula *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 769-770 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The geoid and topography heights of Atla Regio and Beta Regio, both peaks and slopes, appear explicable as steady-state plumes, if non-linear viscosity eta(Tau, epsilon) is taken into account. Strongly constrained by the data are an effective plume depth of about 700 km, with a temperature anomaly thereat of about 30 degrees, leading to more than 400 degrees at the plume head. Also well constrained is the combination Q(eta)/s(sup 4)(sub 0) = (volume flow rate)(viscosity)/(plume radius): about 11 Pa/m/sec. The topographic slopes dh/ds constrain the combination Q/A, where A is the thickness of the spreading layer, since the slope varies inversely with velocity. The geoid slopes dN/ds require enhancement of the deeper flow, as expected from non-linear viscosity. The Beta data are best fit by Q = 500 m(sup 3)/sec and A equals 140 km; the Atla, by Q equals 440 m(exp 3)/sec and A equals 260 km. The dynamic contribution to the topographic slope is minor.

PRELIMINARY ANALYSIS OF DIONE REGIO, VENUS: THE FINAL MAGELLAN REGIONAL IMAGING GAP Abstract Only
S. T. Keddie *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 771-772 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

In Sep. 1992, the Magellan spacecraft filled the final large gap in its coverage of Venus when it imaged an area west of Alpha Regio. F-BIDR's and some test MIDR's of parts of this area were available as of late December. Dione Regio was imaged by the Arecibo observatory and a preliminary investigation of Magellan images supports the interpretations made based on these earlier images: Dione Regio is a regional highland on which is superposed three large, very distinct volcanic edifices. The superior resolution and different viewing geometry of the Magellan images also clarified some uncertainties and revealed fascinating details about this region.

THE DISTRIBUTION OF LARGE VOLCANOES ON VENUS AS A FUNCTION OF HEIGHT AND ALTITUDE Abstract Only
S. T. Keddie and J. W. Head *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 773-774 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Theory predicts that the slower cooling of lava flows on Venus should result in lava flows that are typically 20 percent longer than their terrestrial counterparts and that the development of neutral buoyancy zones (NBZ) on Venus may be strongly influenced by altitude-controlled variations in surface pressure. Observations that support these predictions would include relatively low heights for Venus volcanoes, and an increase in both the number and development of large edifices with increasing basal altitude. The results of an analysis of the height and altitude distribution of 123 large (diameter greater than 100 km) volcanoes made using Magellan image and altimetry data are presented and these results are used to begin to test the predications of the above theories.

STRUCTURAL MAPPING OF MAXWELL MONTES Abstract Only
Myra Keep and Vicki L. Hansen *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 775-776 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Four sets of structures were mapped in the western and southern portions of Maxwell Montes. An early north-trending set of penetrative lineaments is cut by dominant, spaced ridges and paired valleys that trend northwest. To the south the ridges and valleys splay and graben form in the valleys. The spaced ridges and graben are cut by northeast-trending graben. The northwest-trending graben formed synchronously with or slightly later than the spaced ridges. Formation of the northeast-trending graben may have overlapped with that of the northwest-trending graben, but occurred in a spatially distinct area (regions of 2 deg slope). Graben formation, with northwest-southeast extension, may be related to gravity-sliding. Individually and collectively these structures are too small to support the immense topography of Maxwell, and are interpreted as parasitic features above a larger mass that supports the mountain belt.

I-Xe STRUCTURE OF ILAFEGH 009 AND SHALLOWATER: EVIDENCE FOR EARLY FORMATION AND RAPID COOLING OF IMPACT-DERIVED ENSTATITE METEORITES Abstract Only **c90**
K. Kehm, R. H. Nichols, Jr., C. M. Hohenberg, T. J. McCoy (Hawaii Univ., Honolulu.), and K. Keil (Hawaii Univ., Honolulu.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 777-778 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Enstatite meteorites have proven to be ideal samples for past studies of the I-Xe system. This work focuses on two enstatite meteorites that were formed by impact processes. Ilafegh 009 is a clast-free impact melt rock from the EL chondrite parent body. The Shallowater aubrite likely formed when a fully molten planetesimal collided with a solid planetesimal, mixing fragments of the solid planetesimal into the enstatite mantle of the molten planetesimal. A complex three-stage cooling history resulted from this mixing and later break-up and reassembly of the parent body. The present study indicates that the I-Xe structure of these two meteorites resulted from in situ decay of live I-129 and that both experienced xenon closure of the iodine host phase at approximately the same time. I-Xe cooling rates are consistent with the cooling rates derived from mineralogic and petrologic studies of these objects. The similarities in ages suggest that the region of the nebula in which enstatite parent bodies formed must have experienced an intense early bombardment.

EXPLOSIVE VOLCANISM AND THE COMPOSITIONS OF THE CORES OF DIFFERENTIATED ASTEROIDS Abstract Only **c90**
Klaus Keil and Lionel Wilson *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 779-780 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Eleven iron meteorite groups showing correlations between Ni and siderophile trace elements that are predictable by distribution coefficients between liquid and solid metal of fractionally crystallizing metal magmas, are interpreted to be fragments of the fractionally crystallized cores of 11 differentiated asteroids. Many of these groups crystallized from S-depleted magmas which we propose resulted from removal of the first partial melt (a Fe,Ni-FeS cotectic) by explosive pyroclastic volcanism. It is shown that these dense, negatively buoyant melts can be driven to asteroidal surfaces by the combination of an excess pressure in the melt and the presence of buoyant bubbles of gas which decrease the bulk density of the melt. It is also shown that in typical asteroidal materials, veins will form which grow

into dikes and serve as pathways for migration of melt and gas to asteroidal surfaces. Since cotectic Fe,Ni-FeS melt consists of about 85 wt. percent FeS and 15 wt. percent Fe,Ni, removal of small volumes of eutectic melts results in major loss of S but only minor loss of Fe,Ni, thus leaving sufficient Fe,Ni to form sizeable asteroidal cores. HIGH-RESOLUTION SEISMIC REFLECTION SURVEY AT THE MANSON CRATER, IOWA Abstract Only **c46**
D. A. Keiswetter, R. Black, D. W. Steeples, and R. R. Anderson (Geological Survey, Iowa City, IA.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 781-782 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Approximately 17.4 km of high-resolution reflection data were acquired along an east-west radius of the Manson Impact Structure (MIS) to delineate the shallow (upper 300 m) subsurface structural configuration. The geometry of the shallow structure is poorly known due to a 30-90 m thick Pleistocene till cover. The resolution of the new seismic data is roughly 5-10 times that of existing Vibroseis data. Data quality varies rapidly along the line from exceptional to poor, due primarily to velocity variations associated with the geological complexity of the area. Preliminary results indicate subsurface structural blocks previously envisioned to be several hundreds of meters in size are actually an order of magnitude smaller and more complex. A seismogram-by-seismogram analysis is necessary to confidently identify intricate stratigraphic and structural relationships seen on preliminary CDP sections, as numerous faults, diffractions, and complicated reflection patterns create potential pitfalls. HETEROGENEOUS PLAGIOCLASE COMPOSITIONS IN THE MARALINGA CK4 CHONDRITE Abstract Only **c90**
Lindsay P. Keller *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 783-784 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

One of the characteristic features of CK chondrites is the wide compositional range displayed by feldspar grains in matrix relative to the narrow range of compositions exhibited by the highly equilibrated olivines and pyroxenes. Recently, it was suggested that these heterogeneous feldspar compositions may have been strongly influenced by shock metamorphisms. It is shown that the apparent range of feldspar compositions in Maralinga probably results from annealing during parent body thermal metamorphism rather than shock. The majority of matrix feldspars in Maralinga are typically 50 microns in size and are compositionally zoned, with oligoclase cores (approximately An40) and bytownite rims (approximately An80). The contact between core and rim is sharp and abrupt and is readily observed in backscattered scanning electron microscopy (SEM) images.

CARBON ABUNDANCES, MAJOR ELEMENT CHEMISTRY, AND MINERALOGY OF HYDRATED INTERPLANETARY DUST PARTICLES Abstract Only **c90**
L. P. Keller, K. L. Thomas (Lockheed Engineering and Sciences Co., Houston, TX.), and D. S. McKay *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 785-786 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Hydrated interplanetary dust particles (IDP's) comprise a major fraction of the interplanetary dust particles collected in the stratosphere. While much is known about the mineralogy and chemistry of hydrated IDP's, little is known about the C abundance in this class of IDP's, the nature of the C-bearing phases, and how the C abundance is related to other physical properties of hydrated IDP's. Bulk compositional data (including C and O) for 11 hydrated IDP's that were subsequently examined by the transition electron microscopy (TEM) to determine their mineralogy and mineral chemistry are reported. Our analysis indicates that these hydrated IDP's are strongly enriched in C relative to the most C-rich meteorites. The average abundance of C in these hydrated IDP's is 4X CI chondrite values. The bulk compositions (including C and O) of 11 hydrated IDP's were determined by thin-window, energy-dispersive x ray (EDX) spectroscopy of the uncoated IDP's on Be substrates in the scanning electron microscopy (SEM). As a check on our C measurements, one of the IDP's (L2006H5) was embedded in glassy S, and microtome thin sections were prepared and placed onto Be substrates. Thin-film EDX analyses of multiple thin sections of L2006H5 show good agreement with the bulk value determined in the SEM. Following EDX analysis, the mineralogy and mineral chemistry of each IDP was determined by analyzing ultramicrotome thin sections in a TEM equipped with an EDX spectrometer. Author (revised)

AN INITIAL PERSPECTIVE OF S-ASTEROID SUBTYPES WITHIN ASTEROID FAMILIES Abstract Only **c90**
M. S. Kelley and M. J. Gaffey *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 787-788 (For primary document see N94-16173 03-91)
(Grants NAGw-642; NSF AST-90-12180)
Avail: CASI HC A01/MF A06

Many main belt asteroids cluster around certain values of semi-major axis (a), inclination (i), and eccentricity (e). Hirayama was the first to notice these concentrations which he interpreted as evidence of disruptions of larger parent bodies. He called these clusters 'asteroid families'. The term 'families' is increasingly reserved for genetic associations to distinguish them from clusters of unknown or purely dynamical origin (e.g. the Phocaea cluster). Members of a genetic asteroid family represent fragments derived from various depths within the original parent planetesimal. Thus, family members offer the potential for direct examination of the interiors of parent bodies which have undergone metamorphism and differentiation similar to that occurring in the inaccessible interiors of terrestrial planets. The differentiation similar to that occurring in the inaccessible interiors of terrestrial planets. The condition that genetic family members represent the fragments of a parent object provides a critical test of whether an association (cluster in proper element space) is a genetic family. Compositions (types and relative abundances of materials) of family members must permit the reconstruction of a compositionally plausible parent body. The compositions of proposed family members can be utilized to test the genetic reality of the family and to determine the type and degree of internal differentiation within the parent planetesimal. The interpretation of the S-class mineralogy provides a preliminary evaluation of family memberships. Detailed mineralogical and petrological analysis was done based on the reflectance spectra of 39 S-type asteroids. The result is a division of the S-asteroid class into seven subtypes based on compositional differences. These subtypes, designated S(I) to S(VII), correspond to surface silicate assemblages ranging from monomineralic olivine (dunites) through olivine-pyroxene mixtures to pure pyroxene or pyroxene-feldspar mixtures (basalts). The most general conclusion is that the S-asteroids cannot be treated as a single group of objects without greatly oversimplifying their properties. Each S-subtype needs to be treated as an independent group with a distinct evolutionary history. Author (revised)

TIDAL INTERACTION: A POSSIBLE EXPLANATION FOR GEYSERS AND OTHER FLUID PHENOMENA IN THE NEPTUNE-TRITON SYSTEM Abstract Only
W. D. Kelly and C. L. Wood *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 789-790 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Discovery of geyser-like plumes on the surface of Triton was a highlight of Voyager 2's passage through the Neptune planetary system. Remarkable as these observations were, they were not entirely without precedent. Considering the confirmed predictions for the 1979 Voyager Jovian passage, it was logical to consider other solar system bodies beside Io where tidal effects could be a significant factor in surface processes. It was our intuition that the Neptune-Triton gravitational bond acting at high inclination to the Neptune equator and the fact that Neptune was a fluid body was significant oblateness would produce tidal and mechanical forces that could be transformed into thermal energy vented on Triton's surface. Prior to the Voyager flyby, others have noted that capture and evolution of Triton's orbit from extreme eccentricity to near circular state today would have

resulted in significant tidal heating, but these analysts disregard current day forces. Our calculations indicate that the time varying forces between Neptune-Triton fall midway between those exerted in the Earth-Moon and Jupiter-Io systems, and considering the low level of other energy inputs, this source of internal energy should not be ignored when seeking an explanation for surface activity. In each planet-satellite case, residual or steady-state eccentricity causes time-varying stresses on internal satellite strata. In the case of Jupiter the residual eccentricity is due largely to Galilean satellite interactions, particularly Io-Europa, but in the case of Neptune-Triton, it is the effect of Triton's inclined orbit about an oblate primary. INTERNATIONAL TESTING OF A MARS ROVER PROTOTYPE Abstract Only

Alexsandr Leonovich Kemurjian, V. Linkin (Academy of Sciences, USSR, Moscow.), and L. Friedman (Planetary Society, Pasadena, CA.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 791 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Tests on a prototype engineering model of the Russian Mars 96 Rover were conducted by an international team in and near Death Valley in the United States in late May, 1992. These tests were part of a comprehensive design and testing program initiated by the three Russian groups responsible for the rover development. The specific objectives of the May tests were: (1) evaluate rover performance over different Mars-like terrains; (2) evaluate state-of-the-art teleoperation and autonomy development for Mars rover command, control and navigation; and (3) organize an international team to contribute expertise and capability on the rover development for the flight project. The range and performance that can be planned for the Mars mission is dependent on the degree of autonomy that will be possible to implement on the mission. Current plans are for limited autonomy, with Earth-based teleoperation for the nominal navigation system. Several types of television systems are being investigated for inclusion in the navigation system including panoramic camera, stereo, and framing cameras. The tests used each of these in teleoperation experiments. Experiments were included to consider use of such TV data in autonomy algorithms. Image processing and some aspects of closed-loop control software were also tested. A micro-rover was tested to help consider the value of such a device as a payload supplement to the main rover. The concept is for the micro-rover to serve like a mobile hand, with its own sensors including a television camera. Author (revised)

AN EXPERIMENTAL STUDY OF TRACE ELEMENT PARTITIONING BETWEEN PEROVSKITE, HIBONITE AND MELT: EQUILIBRIUM VALUES Abstract Only **c25**

A. K. Kennedy, G. E. Lofgren (National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, TX.), and G. J. Wasserburg *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 793-794 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The presence of perovskite (CATiO3) and hibonite (Ca Al12O19) within different regions of Calcium-, Aluminum-rich Inclusions (CAI) and the trace element concentrations of these minerals in each circumstance, constrain models of precursor formation, nebular condensation, the thermal history of inclusions with relict perovskite and hibonite, and the formation of the Wark-Lovering rim. At present mineral/melt partition coefficient data for hibonite are limited to a few elements in simple experimental systems, or to those derived from hibonite-glass pairs in hibonite/glass microspherules. Similarly, there is only limited data on perovskite D that are applicable to meteorite compositions. Apart from the importance of partitioning studies to meteorite research, D values also are invaluable in the development of thermodynamic models, especially when data is available for a large number of elements that have different ionic charge and radii. In addition, study of the effect of rapid cooling on partitioning is crucial to our understanding of meteorite inclusions. To expand our knowledge of mineral/melt D for perovskite and hibonite, a study was instituted where D values are obtained in both equilibrium and dynamic cooling experiments. As an initial phase of this study mineral/melt D was measured for major elements (Ca, Mg, Al, Ti, and Si), 15 rare earth elements (La-Lu) and 8 other elements (Ba, Sr, U, Th, Nb, Zr, Hf, and Ge) in perovskite and hibonite grown under equilibrium conditions, in bulk compositions that are respectively similar to Compact Type A (CTA) CAI and to a hibonite/glass microspherule. Experimental mixes were doped with REE at 20-50x chondritic (ch) abundances, Ba at 50 ppm, Sr, Hf, Nb, and Zr at 100 ppm and, U and Th at 200 ppm. Trace element abundances were measured with the PANURGE ion microprobe. Major element compositions were obtained by electron microprobe analysis. Author (revised)

NITROGEN ISOTOPIC SIGNATURES IN AGGLUTINATES FROM BRECCIA 79035 Abstract Only **c25**

John F. Kerridge, Yoosook Kim, Jin S. Kim, and Kurt Marti *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 795-796 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Agglutinates in the size range 125-175 microns from regolith breccia 79035 are substantially depleted in N compared with bulk 79035. Isotopically, agglutinate N closely resembles that found previously in ilmenite separates. The minimum (delta)N-15 value found during stepwise pyrolysis of agglutinates is significantly heavier than that observed for bulk 79035. The major host phase for trapped N in 79035, and the host phase of the lightest isotopic component(s), remain unidentified. Author (revised)

AN INVERSION OF GEOID AND TOPOGRAPHY FOR MANTLE AND CRUSTAL STRUCTURE ON MARS Abstract Only

Walter Kiefer, Bruce Bills, Herb Frey, Steve Nerem, Jim Roark, and Maria Zuber *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 797-798 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Mars has the largest amplitude geoid anomalies and surface topography known on the terrestrial planets. A number of prior studies have analyzed Martian gravity anomalies and topography in terms of isostasy and flexure of the crust and lithosphere. Other studies have emphasized the role of mantle convection in producing gravity anomalies and topography in some regions of Mars. Geoid and topography observations for simultaneous estimates of density anomalies in the crust and mantle of Mars are inverted. In performing this study, a recent degree 50 spherical harmonic expansion of the Martian gravity field (GMM-l) and a corresponding resolution expansion of the USGS Mars topography model are used. However, our analysis is restricted to harmonic degrees up to L equals 25, which are better determined than the higher harmonics. This provides a half-wavelength horizontal resolution of 425 km. LAVA CRUSTS AND FLOW DYNAMICS Abstract Only **c46**

C. R. J. Kilburn *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 799 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Lava flows can be considered as hot viscous cores within thinner, solidified crusts. Interaction between crust and core determines a flow's morphological and dynamical evolution. When the lava core dominates, flow advance approaches a steady state. When crusts are the limiting factor, advance is more irregular. These two conditions can be distinguished by a timescale ratio comparing rates of core deformation and crustal formation. Aa and budding pahoehoe lavas are used as examples of core- and crustal-dominated flows, respectively. A simple model describes the transition between pahoehoe and aa flow in terms of lava discharge rate, underlying slope, and either the thickness or velocity of the flow front. The model shows that aa morphologies are characterized by higher discharge rates and frontal velocities and yields good quantitative agreement with empirical relations distinguishing pahoehoe and aa emplacement on Hawaii. ISOTOPIC SIGNATURES AND DISTRIBUTION OF NITROGEN AND TRAPPED AND RADIOGENIC XENON IN THE ACAPULCO AND FRO90011 METEORITES Abstract Only **c90**
Y. Kim and K. Marti *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 801-802 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Acapulco metal and silicate show distinct N isotopic signatures. Trapped heavy noble gases are carried by 'magnetic' opx and radiogenic Xe-129 excesses are observed in phosphate and in minor surficial phases on metal grains. N and Xe isotopic signatures in FRO90011 do not agree with those observed in Acapulco. The Acapulco meteorite is unique in having achondritic texture and chondritic composition. Its mineralogical study shows the record of high temperature (1100 C) recrystallization. However, this meteorite shows abundances of volatile elements close to the levels observed in carbonaceous chondrites and concentrations of heavy noble gases comparable to those observed in type 4 ordinary chondrites, not expected for a presumed highly equilibrated object. Nitrogen measurements in bulk Acapulco revealed two different isotopic signatures, in apparent conflict with evidence for a high degree of recrystallization. N and Xe were studied in separated mineral phases to search for the carriers in order to better understand the formation and thermal history of the Acapulco parent body. Author (revised)

SEPARATION OF TOPOGRAPHIC AND INTRINSIC BACKSCATTER VARIATIONS IN BISCOPIC RADAR IMAGES: A MAGIC AIRBRUSH Abstract Only **c43**
R. L. Kirk *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 803-804 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Shaded-relief maps portraying landforms as they would appear in the absence of variations in the intrinsic brightness of the surface are a venerable and extremely useful tool in planetary geology. Such maps have traditionally been produced by a highly labor intensive manual process. Skilled cartographer-artists develop detailed mental images of landforms by meticulous scrutiny of all available data, and are able to use an airbrush and electric eraser to draw these images on a map. This process becomes increasingly time-consuming or even impossible if - as is true for radar data in general and Magellan data in particular - the effects on image brightness of varying scattering properties greatly outweigh those of slope variations. Because of the difficulty of interpreting relief in the Magellan images, the airbrush technique is being used only to remove obvious artifacts from low-resolution, shaded-relief images computed digitally from altimetric data. A surprisingly simple digital-processing technique that can be applied to pairs of radar images to produce shaded-relief-like results at the full image resolution is described. These shaded-relief images can be used not only as base maps, but to improve the accuracy of quantitative topographic mapping by radarclinometry and stereoanalysis.

GLOBAL MAGELLAN-IMAGE MAP OF VENUS AT FULL RESOLUTION Abstract Only
R. L. Kirk, K. B. Edwards, H. F. Morgan, L. A. Soderblom, and T. L. Stoewe *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 805-806 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

During its first 243-day mapping cycle, the Magellan spacecraft succeeded in imaging 84 percent of the surface of Venus at resolutions on the order of 100 meters; subsequent cycles have increased the total coverage to over 97 percent and provided redundant coverage of much of the planet with differing viewing geometries. Unfortunately, this full-resolution global dataset is in the form of thousands of individual orbit tracks (F-BIDR's) whose length-to-width ratio of nearly 1000:1 makes them minimally useful unless mosaicked. The Magellan project produced full-resolution mosaics (F-MIDR's) only for selected regions on the planet, whereas a global set of mosaics was made only at threefold degraded resolution (C1-MIDR's). Furthermore, although the F-MIDR's, which are approximately equidimensional, are much better suited for scientific interpretation than the F-BIDR's, they are still an unwieldy dataset: over 1500 quadrangles, each showing a region only about 600 km on a side, would be required to cover the entire planet. The USGS has therefore undertaken to produce and distribute a global, full resolution set of mosaics of the Magellan image data in a format that will be efficient for both hardcopy and digital use. The initial motivation was that it would provide an efficient means of verifying the integrity of the F-BIDR's to be archived on computer-compatible tape at the USGS Flagstaff facility. However, the resulting product, known as the FMAP, should also serve as an important resource for future scientific interpretation. It will offer several advantages beyond global coverage at full resolution. The first, alluded to above, is its division of the planet's surface to minimize the number of quadrangles and maximize their area, subject to the limits on the number of pixels imposed by state-of-the-art digital recording media and hardcopy output devices. The second, the use of improved 'cosmetic' processing techniques, will greatly reduce tonal discontinuities between component F-BIDR's in the FMAP compared to the standard Magellan mosaic products. Finally, wherever possible, the FMAP will incorporate data that were unavailable (e.g., because of processing delays) when the standard MIDR products were created, as well as data that were reprocessed to improve their radiometric or geometric quality.

THE CARTOGRAPHY OF VENUS WITH MAGELLAN DATA Abstract Only
R. L. Kirk, H. F. Morgan, and J. F. Russell *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 807 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Maps of Venus based on Magellan data are being compiled at 1:50,000,000, 1:5,000,000 and 1:1,500,000 scales. Topographic contour lines based on radar altimetry data are overprinted on the image maps, along with feature nomenclature. Map controls are based on existing knowledge of the spacecraft orbit; photogrammetric triangulation, a traditional basis for geodetic control for bodies where framing cameras were used, is not feasible with the radar images of Venus. Preliminary synthetic aperture radar (SAR) image maps have some data gaps and cosmetic inconsistencies, which will be corrected on final compilations. Eventual revision of geodetic controls and of the adopted Venusian spin-axis location will result in geometric adjustments, particularly on large-scale maps. Author

OSMIUM ISOTOPES IN IVORY COAST TEKTITES: CONFIRMATION OF A METEORITIC COMPONENT AND RHENIUM DEPLETION Abstract Only **c90**
Christian Koeberl and Steven B. Shirey (Carnegie Institution of Washington, DC.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 809-810 (For primary document see N94-16173 03-91)
(Grant NSF EAR-92-18847; FWF Proj. P9026-GEO)
Avail: CASI HC A01/MF A06

The sensitive negative thermal ionization mass spectrometry method was used for the measurement of concentrations and isotopic ratios of osmium and rhenium in four Ivory Coast tektites. These tektites have crustal major and trace element composition, as well as large negative epsilon(sub Nd)(-20) and positive epsilon(sub Sr)(+260 to +300) which are characteristic for old continental crust. Os concentrations ranging from 0.09 to 0.30 ppb were found, clearly much higher than average crustal values, Os-187/Os-186 ratios of about 1.2-1.7, and low Re-187/Os-186 ratios. These results show unambiguously the existence of a meteoritic component (on the order of 0.06%) in the Ivory Coast tektites. Low Re abundances are the result of fractionation of Re during the impact.

(FWF Proj. P8794-GEO)
Avail: CASI HC A01/MF A06

The Manson Impact Structure is a large complex impact crater centered ca. S km north of the town of Manson, Iowa. It is the largest intact impact structure recognized in the United States (35 km in diameter). Its Ar-40/Ar-39 age is indistinguishable from that of the Cretaceous-Tertiary (K-T) boundary. The Manson structure may be one element of the events at the K-T boundary. The crater is completely covered by Quaternary glacial sedimentary deposits that are normally underlain by Cretaceous clastic sediments and flat-lying carbonate sediments of Phanerozoic age, as well as Proterozoic red clastic, metamorphic, volcanic, and plutonic rock sequences. The study of a reflection seismic profile, provided by Amoco, was critical in interpreting the structure. In the 35 km diameter zone that marks the extension of the crater the normal rock sequence is disturbed due to the impact, and at the center of the structure granitic basement rocks are present that have been uplifted from about 4 km depth. Our studies consist of detailed petrological and geochemical characterization of all cores, with emphasis on a detailed description of all rock types found in the core samples and their relationship to target rocks. Geochemical data on samples from the Manson M-1 core are presented. Author (revised)

AGE DETERMINATIONS AND EARTH-BASED MULTISPECTRAL OBSERVATIONS OF LUNAR LIGHT PLAINS Abstract Only
U. Koehler, R. Jaumann, and G. Neukum *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 813-814 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The history of light plains still remains doubtful, but there are good arguments - mainly obtained by age determinations and supported by multispectral observations - for an endogenic (magmatic) instead of an (exclusively) impact related origin. Light plains are characterized by smooth areas with an albedo lower than the surrounding highlands (12 - 13 percent), but significantly higher than maria (5 - 6 percent). Before Apollo 16 a volcanic source has been supposed, but analysis of returned samples (highly brecciated and metamorphosed rocks) favored an impact ejecta related origin. Among the currently discussed models are formation by ejecta sedimentation from multi-ringed basins, formation by secondary and tertiary cratering action of ballistically ejected material during the formation of multi-ringed basins, in situ formation by impact melt of large events, and premare (crypto-) volcanism basalts covered by a thin ejecta cover; younger impacts penetrated the ejecta surface to create the dark haloed craters. To find arguments in favor or against these ideas the chronology of light plains is of major importance. Obviously a genetic relationship between the evolution of light plains and the basin forming impacts can be possible only if the events of emplacement features happened simultaneously. MEANDER PROPERTIES OF VENUSIAN CHANNELS Abstract Only
G. Komatsu and V. R. Baker *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 815-816 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Venusian lava channels have meander dimensions that relate to their mode of formation. Their meander properties generally follow terrestrial river trends of wavelength (L) to width (W) ratios, suggesting an equilibrium adjustment of channel form. Slightly higher L/W for many Venusian channels in comparison to terrestrial rivers may relate to nonaqueous flow processes. The unusually low L/W values for some Venusian and lunar sinuous rilles probably indicate modification of original meander patterns by lava-erosional channel widening. Author (revised)

TERRESTRIAL BITUMEN ANALOGUE OF ORGUEIL ORGANIC MATERIAL DEMONSTRATES HIGH SENSITIVITY TO USUAL HF-HCl TREATMENT Abstract Only **c23**
A. V. Korochantsev and O. V. Nikolaeva *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 817-818 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The relationship between the chemical composition and the interlayer spacing (d002) of organic materials (OM's) is known for various terrestrial OM's. We improved this general trend by correlation with corresponding trend of natural solid bitumens (asphaltite-kerite-anthraxolite) up to graphite. Using the improved trend we identified bitumen analogs of carbonaceous chondrite OM's residued after HF-HCl treatment. Our laboratory experiment revealed that these analogs and, hence, structure and chemical composition of carbonaceous chondrite OM's are very sensitive to the HF-HCl treatment. So, usual extraction of OM from carbonaceous chondrites may change significantly structural and chemical composition of extracted OM.

COMPOSITION OF APOLLO 17 CORE 76001 Abstract Only
Randy L. Korotev and Kaylynn M. Bishop *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 819-820 (For primary document see N94-16173 03-91)
(Grant NAG9-56)
Avail: CASI HC A01/MF A06

Core 76001 is a single drive tube containing a column of regolith taken at the base of the North Massif, station 6, Apollo 17. The core material is believed to have accumulated through slow downslope mass wasting from the massif. As a consequence, the core soil is mature throughout its length. Results of INAA for samples taken every half centimeter along the length of the core indicate that there is only minor systematic compositional variation with depth. Concentrations of elements primarily associated with mare basalt (Sc, Fe) and noritic impact melt breccia (Sm) decrease slightly with depth, particularly between 20 cm and the bottom of the core at 32 cm depth. This is consistent with petrographic studies that indicate a greater proportion of basalt and melt breccia in the top part of the core. However, Sm/Sc and La/Sm ratios are remarkably constant with depth, indicating no variation in the ratio of mare material to Sm-rich highlands material with depth. Other than these subtle changes, there is no compositional evidence for the two stratigraphic units (0-20 cm and 20-32 cm) defined on the basis of modal petrography, although all samples with anomalously high Ni concentrations (Fe-Ni metal nuggets) occur above 20 cm depth. Author (revised)

COMPOSITION AND MATURITY OF THE 60013/14 CORE Abstract Only
Randy L. Korotev, Richard V. Morris (National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, TX.), and Howard V. Lauer, Jr. (Lockheed Engineering and Sciences Co., Houston, TX.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 821-822 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The 60013/14 double drive tube (62 cm deep) is one of three regolith cores taken 35-40 m apart in a triangular array on the Cayley plains at station 10' (LM/ALSEP), Apollo 16. This trio, which includes double drive tube 60009/10 (59 cm deep) and deep drill core 60001-7 (220 cm), is the only such array of cores returned from the Moon. The top 45 cm of 60013/14 is mature, as is surface reference soil 60601 taken nearby. Maturity generally decreases with depth, with soil below 45 cm being submature. The zone of lowest maturity (34 is less than or equal to I(sub s)/FeO is less than 50) extends from 46 to 58 cm depth, and corresponds to the distinct region of light-colored soil observed during core processing. In the other two cores, most of the compositional variation results from mixing between fine-grained, mature soil with 10-11 micro-g/g Sc and coarse-grained ferroan anorthosite consisting of greater than 99% plagioclase with less than 0.5 micro-g/g Sc. This is most evident in 60009/10 which contains a high abundance of plagioclase at about 54 cm depth (minimum Sc: 3-4 micro-g/g); a similar zone occurs in 60001-7 at 17-22 cm (MPU-C), although it is not as rich in plagioclase (minimum Sc: 6-7 micro-g/g). Compositional variations are less in 60013/14 than in the other two cores (range: 7.9-10.0 micro-g/g Sc), but are generally consistent with

the 'plagioclase dilution' effect seen in 60009/10, i.e., most 60013/14 samples plot along the mixing line of 60009/10. However, a plagioclase component is not the cause of the lower maturity and lighter color of the unit at 46-58 cm depth in 60013/14. Many of the samples in this zone have distinctly lower Sm/Sc ratios than typical LM-area soils and plot off the mixing trend defined by 60009/10. This requires a component with moderately high Sc, but low-Sm/Sc, such as feldspathic fragmental breccia (FFB) or granulitic breccia. A component of Descartes regolith, such as occurs at North Ray Crater (NRC) and which is rich in FFB, could account for the composition of these soils (i.e., a 3:1 mixture of 60601 and NRC soil). It seems unlikely that NRC ejecta would occur half a meter deep at the LM station, thus this low-Sm/Sc component may result from an older, local crater that penetrated the Cayley surface layer and excavated underlying Descartes material, as did North Ray Crater. There is no evidence for such a unit or component in the other two cores. Soil below the light-colored unit (58-62) cm has 'typical' Sm/Sc ratios, but the lowest absolute Sc concentrations, i.e., it is compositionally equivalent to a mixture of surface soil and plagioclase such as that in ferroan anorthosite. This is the only soil that might be related to the plagioclase-rich units in the other two cores. Except for the mature soil at the top of each core and, perhaps, the plagioclase-rich layers, there is little compositional evidence for any common unit among the three cores. Soil corresponding to the mare-glass-bearing unit (MPU-B) and regolith-breccia-bearing unit (MPU-A) of 60001-7 do not occur in 60013/14 or 60009/10. Author (revised)

CAT MOUNTAIN: A METEORITIC SAMPLE OF AN IMPACT-MELTED CHONDRITIC ASTEROID Abstract Only **c90**

David A. Kring *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 823-824 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Although impact cratering and collisional disruption are the dominant geologic processes affecting asteroids, samples of impact melt breccias comprise less than 1 percent of ordinary chondritic material and none exist among enstatite and carbonaceous chondrite groups. Because the average collisional velocity among asteroids is sufficiently large to produce impact melts, this paucity of impact-melted material is generally believed to be a sampling bias, making it difficult to determine the evolutionary history of chondritic bodies and how impact processes may have affected the physical properties of asteroids (e.g., their structural integrity and reflectance spectra). To help address these and related issues, the first petrographic description of a new chondritic impact melt breccia sample, tentatively named Cat Mountain, is presented. Author (revised)

COMPARATIVE MAGNETIC AND THERMOANALYTICAL STUDY OF TWO ENSTATITE CHONDRITES: ADHI KOT AND ATLANTA Abstract Only **c90**

Elizabeth Krol and Bruno Lang (Warsaw Univ., Poland.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 825-826 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

With allowance for the discussion of classification of enstatite chondrites and their relation to aubrites, the obtained magnetic and thermoanalytical data is submitted to be considered as additive arguments. Our study covered the Adhi Kot (EH4) and Atlanta (EL6). meteorites belonging to two distinct groups of enstatite chondrites. Applying AF demagnetization the intensity of natural remanent magnetization (NRM) was measured and the mean magnetic susceptibility of the samples was determined. The differential thermal (DTA) and thermogravimetric (TG) curves were obtained for meteorites under study. For measurements of the intensity of NRM, a superconducting cryomagnetometer SQUID (2 G Enterprise, USA), while magnetic susceptibility Kappabridge KLY-2 (Czechoslovakia) were used. The abbreviated magnetic data sheets are given. The values 786 x 10(exp -4)A/mkg and 196.1 x 10(exp -4)A/mkg were obtained as NRM intensities for Atlanta and Adhi Kot respectively, while 17.4 x 10(exp -6) Slu/kg and 43.4 x 10(exp -6) Slu/kg for their susceptibilities. Both meteorites proved to be strongly magnetized. The demagnetization down to 3.2 percent of NMR was received for Atlanta at AF field intensity of 250 Oe. For Adhi Kot at this level rested 13.2 percent of NRM intensity, this sample being demagnetized without change of direction till 750 Oe field. The demagnetization curves are similar to those obtained for Abee (EL4) chondrite by Sugiura and Strangway. Against Abee the Adhi Kot exhibited a little bit steeper downfall, and in both cases dominate one component of magnetization. The DTA and TG curves were obtained with Rigaku-Denki thermoanalytical instrument. The DTA curves exhibit striking similarity in their shape and relatively close temperature values for various features. The same is valid for TG curves. The higher values for TG for Adhi Kot express its higher content of oxydable (Fe, Ni) whose oxidation in air is reached at 1000-1200 C. Author (revised)

CHROMITE-RICH MAFIC SILICATE CHONDRULES IN ORDINARY CHONDRITES: FORMATION BY IMPACT MELTING Abstract Only **c90**

Alexander N. Krot and Alan E. Rubin *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 827-828 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Chromium-rich chondrules constitute less than 0.1 percent of all ordinary chondrite (OC) chondrules and comprise three groups: chromian-spinel chondrules, chromian-spinel inclusions, and chromite-rich mafic silicate (CRMS) chondrules. Chromian-spinel chondrules (typically 100-300 microns in apparent diameter) exhibit granular, porphyritic and unusual textures and occur mainly in H chondrites. Their morphologies are distinct from the irregularly shaped chromian-spinel inclusions of similar mineralogy. Chromian-spinel chondrules and inclusions consist of grains of chromian-spinel embedded in plagioclase (Pl) or mesostasis of Pl composition. Many also contain accessory ilmenite (Ilm), high-Ca pyroxene (Px), merrillite (Mer), and rare olivine (Ol); some exhibit concentric mineral and chemical zoning. CRMS chondrules (300-1100 microns in apparent diameter) are generally larger than chromian-spinel chondrules and occur in all metamorphosed OC groups. Most CRMS chondrules are nearly spherical although a few are ellipsoidal with a/b aspect ratios ranging up to 1.7. Textures include cryptocrystalline, granular, radial, barred, and porphyritic varieties; some contain apparently relict grains. The chondrules consist of chromite (Chr), Ol and Pl, along with accessory Mer, troilite (Tr), metallic Fe-Ni (Met), Px and Ilm. The mesostasis in CRMS chondrules is nearly opaque in transmitted light; thus, they can be easily recognized in the optical microscope. Based on the similarity of mineralogy and chemistry between CRMS chondrules of different textures (opaque chromite-rich mesostasis, skeletal morphology of Ol grains, similar bulk compositions) we suggest that these chondrules form a genetically related population. EVAPORATION KINETICS OF Mg_2SiO_4 CRYSTALS AND MELTS FROM MOLECULAR DYNAMICS SIMULATIONS Abstract Only **c76**

J. D. Kubicki and E. M. Stolper *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 829-830 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Computer simulations based on the molecular dynamics (MD) technique were used to study the mechanisms and kinetics of free evaporation from crystalline and molten forsterite (i.e., Mg_2SiO_4) on an atomic level. The interatomic potential employed for these simulations reproduces the energetics of bonding in forsterite and in gas-phase MgO and SiO_2 reasonably accurately. Results of the simulation include predicted evaporation rates, diffusion rates, and reaction mechanisms for Mg_2SiO_4(s or l) yields $2Mg(g) + 2O(g) + SiO_2(g)$. Author (revised)

An analysis of newly available global harmonic models for topography

and geoid on Venus was conducted. It was found that the power spectral density for Venus topography has a power law dependence on wave-number characteristic of Brown Noise, similar to what is found for the Earth. However, the Venus topography spectrum presents a rollover at lower degree (l = 3) than is observed for the Earth spectrum and has smaller amplitudes than that of the Earth's. The Venus geoid also obeys a power law relationship, at least for small values of l, but with a smaller slope and more power (for l greater than 3) than the Earth geoid. Author (revised)

VERTICAL STRUCTURE MODELS OF THE 1990 EQUATORIAL DISTURBANCE ON SATURN Abstract Only

D. M. Kuehn, Christopher Dwight Barnet (Institute for Space and Terrestrial Science, Concord, Ontario.), and R. F. Beebe (New Mexico State Univ., University Park.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 833 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

In September 1990, an atmospheric disturbance in the form of an abnormally high albedo area developed in the equatorial region of Saturn. Events of this nature are exceedingly rare for this planet as they have been detected in the equatorial region on only two other occasions in over a century. In ongoing monitoring of the atmospheres of the outer planets, CCD imaging observations of Saturn by New Mexico State University's Tortugas Mountain Station were made before, during, and after the disturbance's formation through both broad-band filters and narrow-band visible/near-IR filters centered in methane absorption bands. Also, multispectral Hubble Space Telescope observations were made within weeks of the event and later in 1991. These observations were calibrated and scans of reflectivity at constant latitude are being modeled with a vertically inhomogeneous, multiple scattering model previously used to model Jupiter's South Equatorial Belt brightening event in 1989. In addition, the reflectivity of the disturbance as a function of the scattering angles is being obtained so as to model this feature's vertical structure in particular. A preliminary report of the modeling results will be presented. Author (revised)

PRELIMINARY Ar-40/Ar-39 AGE SPECTRUM AND LASER PROBE DATING OF THE M1 CORE OF THE MANSON IMPACT STRUCTURE, IOWA: A K-T BOUNDARY CRATER CANDIDATE Abstract Only c46

M. J. Kunk, L. W. Snee (Geological Survey, Denver, CO.), B. M. French (National Aeronautics and Space Administration, Washington, DC.), S. S. Harlan (Geological Survey, Denver, CO.), and J. J. McGee *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 835-836 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Preliminary Ar-40/Ar-39 age spectrum and laser probe dating results from new drill core from the 35-km-diameter Manson Impact Structure (MIS), Iowa indicates a reasonable possibility that the MIS is a Cretaceous-Tertiary (K-T) boundary impact event. Several different types of samples from a melt-matrix breccia, a unit of apparent crater fill intersected by the M1 core, were analyzed. Ar-40/Ar-39 results from these samples indicate a maximum age for the MIS of about 65.4 plus or minus 0.4(2 sigma) Ma. Petrographic analyses of the samples indicate a high probability that all the dated samples from the melt-matrix breccia contain relict grains that were not entirely melted or degassed at the time of impact, suggesting that the actual age of the MIS could be somewhat younger than our preliminary results indicate. The results are consistent with a previously published age estimate of shocked microcline from the MIS central uplift of 65.7 plus or minus 1.0 Ma. Author (revised)

Degassing of H2O in the planetary interior possibly plays an important role in the evolution of surface environment as well as geologic activity on the terrestrial planets. Mars may be such a planet that well preserves the materials and the geologic features directly related to early evolution of H2O. H2O content in the interior of proto-Mars during accretion and also core formation were investigated. Geodetic data shows that Mars has a dense core. The existence of iron-rich core on Mars may be also supported by the depletion of siderophile elements in SNC meteorites assuming that these samples came from Mars. Isotope systematics of these meteorites indicate that the core formation occurred very early, probably concurrently with Mars formation. Considering the kinetics of metal segregation from silicate, the melting of silicate is likely to precede the core formation. Once the core formation occurs, substantial amount of gravitational energy is released and thus the planetary interior is heated. This energy may be large enough to keep the silicate material in partially molten state along with the accretional heating. Under such circumstances, the silicate melt probably migrates to the surface. Early crustal formation, therefore, is also likely to be associated with the core formation. Author (revised)

WATER IN EARTH'S MANTLE: HYDROGEN ANALYSIS OF MANTLE OLIVINE, PYROXENES AND GARNET USING THE SIMS Abstract Only c46

Masanori Kurosawa, Hisayoshi Yurimoto, and Shigeho Sueno *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 839-840 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Hydrogen (or water) in the Earth's interior plays a key role in the evolution and dynamics of the planet. However, the abundance and the existence form of the hydrogen have scarcely been clear in practice. Hydrogen in the mantle was incorporated in the interior during the formation of the Earth. The incorporated hydrogen was hardly possible to concentrate locally inside the Earth considering its high mobility and high reactivity. The hydrogen, preferably, could be distributed homogeneously over the mantle and the core by the subsequent physical and chemical processes. Therefore, hydrogen in the mantle could be present in the form of trace hydrogen in nominally anhydrous mantle minerals. The hydrogen and the other trace elements in mantle olivines, orthopyroxenes, clinopyroxenes, and garnets were determined using secondary ion mass spectrometry (SIMS) for elucidating (1) the exact hydrogen contents, (2) the correlation between the hydrogen and the other trace elements, (3) the dependence of the hydrogen contents on the depth, and (4) the dependence of the whole rock water contents on the depth. LUNAR LIGO: A NEW CONCEPT IN GRAVITATIONAL WAVE ASTRONOMY Abstract Only

Norman LaFave and Thomas L. Wilson (National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, TX.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 841-842 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

For three decades, physicists have been in search of an elusive phenomenon predicted by Einstein's general theory of relativity; gravitational radiation. These weak vibrations of spacetime have, thus far, eluded conclusive Earth-based detection due in part to insufficient detector sensitivity and noise isolation. The detection of gravitational waves is crucial for two reasons. It would provide further evidence for the validity of Einstein's theory of relativity, the presently accepted theory of gravitation. Furthermore, the ability to identify the location of a source of a detected gravitational wave event would yield a radical new type of astronomy based on non-electromagnetic emissions. We continue our study of a lunar-based system which can provide an important complement to Earth-based analysis because it is completely independent of the geophysical sources of noise on Earth, while providing an Earth-Moon baseline for pin-pointing burst sources in the Universe. We also propose for the first time that a simplified version of the LIGO beam detector optical system, which we will call LLIGO (Lunar LIGO), could be emplaced on the Moon as part of NASA's robotic lander program now under study (Artemis). The Earth-based investigation has two major programs underway. Both involve large interferometer-type gravitational wave antennas. Author (revised)

SHEET FLOW FIELDS ON VENUS
M. G. Lancaster, J. E. Guest, and K. M. Roberts (Brown Univ., Providence, RI.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 843-844 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

A survey of flow fields with areas greater than 50,000 sq km revealed fields with sheet-like morphology. These sheet flow fields are distinguished by their relatively uniform backscatter, lack of internal flow structure such as well defined lava streams or channels, absence of flow lobes, and irregular boundaries. Internal flow boundaries are essentially absent in these fields, and as such they cannot usually be divided into separate stratigraphic units or eruptive episodes. This is unlike other flow fields with more digitate morphologies, which are made up of discrete flow lobes, and can usually be divided into several episodes of flow emplacement. Five sheet flow fields were studied so far, and other candidates were found. A flow field associated with Lauma Dorsa is taken as an example and examined in detail. Author (revised)

As a product of our interest in remote sensing of planetary ices, frost samples of CO2 clathrate hydrate were grown by depositing water vapor on a cooled surface and pressurizing the resulting water frost with CO2 gas. At pressures above the dissociation pressure of the clathrate, the samples exhibit an absorption peak at 75 cm (sup -1). At pressures below the dissociation pressure, the peak disappears. Since the free CO2 molecule does not have rotational or vibrational absorption in this region, the absorption is attributed to a CO2 rattling mode within a clathrate cage. Author (revised)

ORIENTATION OF PLANAR DEFORMATION FEATURES (PDFs) IN QUARTZ Abstract Only **c76**
F. Langenhorst and A. Deutsch *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 849-850 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Differently oriented single crystal quartz was shocked experimentally at pressures of 20 to 32 GPa and pre-shock temperatures up to 630 C. Based on this systematic investigation, we can demonstrate that the orientation of planar deformation features in quartz is not only dependent on shock pressure but also on pre-shock temperature and shock direction. Moreover, the orientation of Planar Deformation Features (PDF's) is strongly influenced by the set-up in recovery experiments. PDF's in quartz are defined as optically recognizable, planar microstructures diagnostically produced by shock compression. PDF's differ from all kinds of microstructures found in volcanic environment and therefore, their presence is a primary criterion for recognizing impact craters and ejecta layers such as the K/T boundary. Because experiments have shown a pressure dependence of the orientation of PDF's, this property is used extensively for shock wave barometry in natural impact sites. However, the unreflected application of experimental results neglects that parameters such as pre-shock temperature, shock direction, or the experimental arrangement may influence the spatial distribution of PDF's. In order to test this assumption, shock experiments on single crystal quartz at pre-shock temperatures of 20, 275, 540, and 630 C, and with shock directions (1010) and (0001) were performed. Most of the recovery experiments were carried out by using a reverberation technique, whereas in only one experiment a single shock was produced (impedance method). In the former case 0.5 mm thin discs of single crystal quartz were used, in the latter a 15 mm thick cylinder. The orientation of PDF's was measured by means of a conventional universal stage and the results are given. Effects of the experimentation technique can be derived showing the orientation of PDF's in quartz shocked at 27.5 GPa. In comparison to the well defined peaks at (1012) found in samples from reverberation experiments, the impedance matching technique causes PDF's with a broad distribution pattern and indistinct maxima. Our results have serious implications for shock-wave barometry in nature: the existing classification scheme which relates PDF orientation exclusively to shock pressure is no longer applicable. In consequence more experimental data is needed. Author (revised)

LUNAR PHASE FUNCTION EFFECTS ON SPECTRAL RATIOS USED FOR RESOURCE ASSESSMENT Abstract Only
S. M. Larson, J. Collins, R. B. Singer, J. R. Johnson, and D. E. Melendrez *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 851-852 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Groundbased telescopic CCD images of 36 selected locations on the moon were obtained in five 'standard' bandpasses at 12 phase angles ranging from -78 deg to +75 deg to measure phase function effects on the ratio values used to quantify the abundance of TiO2 and qualitatively indicate soil maturity. Consistent with previous studies, we find that the moon is 'bluer' at small phase angles, but that the effect on the ratio values for TiO2 abundance for the phase angles of our data is on the order of the measurement uncertainties throughout the range of abundances found in the mare. The effect is more significant as seen from orbiting spacecraft over a range of selenographic latitude. Spectral ratio images (400/560 and 400/730 nm) were used to map the abundance of TiO2 using the empirical relation found by Charlette et al from analysis of returned lunar soils. Additionally, the 950/560 and 950/730 nm image ratios were used to define the regions of mature mare soil in which the relation is valid. Although the phase function dependence on wavelength was investigated and quantified for small areas and the integrated disc, the effect specifically on TiO2 mapping was not rigorously determined. For consistency and convenience in observing the whole lunar front side, our mapping utilized images taken -15 deg less than alpha less than 15 deg when the moon was fully illuminated from earth; however, this includes the strong opposition peak. THE ASTROPHYSICAL INTERPRETATION OF ISOTOPE ANOMALIES IN GRAPHITE AND SiC GRAINS OF CHONDRITES Abstract Only **c90**
A. K. Lavrukhina *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 853-854 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The C, N, and Mg isotopic compositions in graphite and SiC grains of carbonaceous chondrites can be explained by nuclear processes in massive O,B stars of second generation passed a stage of WR star with intensive stellar wind, where grain condensation had taken place. The interstellar graphite and SiC grains with anomalous isotopic compositions of C, N, Ne, and Si and other elements of nucleosynthetic origin, found in non-equilibrated chondrites, are most suitable for determination of astro-physical objects, where nucleosynthesis had taken place. Two objects were examined: (1) massive O,B stars of second generation passed a stage of WR star with

intensive stellar wind (O,B-WR model) and (2) low-mass stars (1 less than or equal to M/solar mass less than or equal to 3) during thermally pulsing asymptotic giant branch phase (TP-AGB model). Author

ON POSSIBLE Mn-53 HETEROGENEITY IN THE EARLY SOLAR SYSTEM Abstract Only **c90**

A. K. Lavrukhina and G. K. Ustinova *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 855-856 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The effects of influence of shock wave propagation on the energy spectrum of accelerated particles that lead to different production rates of radionuclides, in particular, Mn-53, on small scales in the early solar system are shown. Search for evidence for extinct Mn-53 has stimulated investigations of Cr isotope anomalies in meteorites. The linear correlation between the magnitude of the Cr-53* excesses and the Mn/Cr ratio that unambiguously proves the in situ decay of Mn-53 was detected, really, in different mineral phases of some carbonaceous and enstatite chondrites, primitive achondrites, pallasites and iron meteorites. However, the data on the Cr-53* excess rarely defines a single linear array on a Mn-53-Cr-52 evolution diagram even for meteorites of the same chemical group. A clear isochron with Mn-53/Mn-55 = 4.4 plus or minus 1.0 x 10(exp -5) (in range of approximately 2.4 to approximately 9 x 10(exp -5)) is observed for CAI of the Allende C3-chondrite while the data for the Murchison C2- and Orgueil C1-chondrites fall much lower corresponding rather to Mn-53/Mn-55 less than 2 x 10(exp -5). In the case of iron meteorites it ranges from less than 5 x 10(exp -8) to less than 5 x 10(exp -5).

ON ORIGIN OF THE OLIVINE INCLUSIONS FROM THE KAINSAZ CO CARBONACEOUS CHONDRITE Abstract Only **c90**

A. K. Lavrukhina, Z. A. Lavrentjeva, A. Yu. Ljul, and K. I. Ignatenko *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 857-858 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Olivine inclusions and chondrules of Kainsaz were formed in a unique process of dust matter melting. The elemental abundances of four fractions of olivine (01) inclusions from Kainsaz were analyzed by INAA. The inclusions of fraction A (160 less than d less than 260 microns) have Fe-Ni grains, the inclusions of fractions B (100 less than d less than 160 microns), C (160 less than d less than 260 microns), and D (260 less than d less than 360 microns) do not. The average elemental enrichment factors relative to CI chondrite for each fraction and chondrules of Kainsaz is shown. The enrichment factors of siderophile Co, Ni, Ir, Au, and non-refractory Na in all fractions are less than 1. The factors of refractory Ca, Sc, La, Sm, and Yb are comparative with the corresponding values of O1 aggregates of Allende CV (average 4.76). For chondrules of Kainsaz these values are lower. Fraction A is enriched in Co, Ir, Au, and relative Ni and CI chondrites: Ir greater than Au greater than Co. The values of (Me/Ni)inc/(Me/Ni)CI are equal to 3.25 for Ir, 2.1 for Au, and 1.2 for Co. The superabundances in Ir and Au relative to Ni witness to formation of Fe-Ni grains of O1 inclusions by agglomeration of grains enriched in refractory metal with grains enriched in non-refractory metal (Au). The enrichments of fraction A in Ca, Sc, La, Sm, and Yb witness about presence of high-temperature phases in O1 inclusions. Author (revised)

TEACHING PLANETARY SCIENCES TO ELEMENTARY SCHOOL TEACHERS: PROGRAMS THAT WORK Abstract Only **c80**

Larry A. Lebofsky and Nancy R. Lebofsky *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 859 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Planetary sciences can be used to introduce students to the natural world which is a part of their lives. Even children in an urban environment are aware of such phenomena as day and night, shadows, and the seasons. It is a science that transcends cultures, has been prominent in the news in recent years, and can generate excitement in young minds as no other science can. Planetary sciences also provides a useful tool for understanding other sciences and mathematics, and for developing problem solving skills which are important in our technological world. However, only 15 percent of elementary school teachers feel very well qualified to teach earth/space science, while better than 80 percent feel well qualified to teach reading; many teachers avoid teaching science; very little time is actually spent teaching science in the elementary school: 19 minutes per day in K-3 and 38 minutes per day in 4-6. While very little science is taught in elementary and middle school, earth/space science is taught at the elementary level in less than half of the states. It was pointed out that science is not generally given high priority by either teachers or school districts, and is certainly not considered on a par with language arts and mathematics. Therefore, in order to teach science to our youth, we must empower our teachers, making them familiar and comfortable with existing materials. In our earlier workshops, several of our teachers taught in classrooms where the majority of the students were Hispanic (over 90 percent). However, few space sciences materials existed in Spanish. Therefore, most of our materials could not be used effectively in the classroom. To address this issue, NASA materials were translated into Spanish and a series of workshops for bilingual classroom teachers from Tucson and surrounding cities was conducted. Our space sciences workshops and our bilingual classroom workshops and how they address the needs of elementary school teachers in Arizona are addressed in detail. Author (revised)

A SIMULTANEOUS ESTIMATION OF THE MASS OF MARS AND ITS NATURAL SATELLITES, PHOBOS AND DEIMOS, FROM THE ORBITAL PERTURBATIONS ON THE MARINER 9, VIKING 1, AND VIKING 2 ORBITERS Abstract Only

F. G. Lemoine, D. E. Smith (Maryland Univ., College Park.), S. K. Fricke (RMS Technologies, Inc., Landover, MD.), and J. J. McCarthy (Hughes STX, Inc., Lanham, MD.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 861-862 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The natural satellites of Mars, Phobos and Deimos, caused perturbations on the orbits of the Mariner 9, and the Viking spacecraft that were used to estimate the satellite masses. The Viking spacecraft were specifically targeted to make close flybys (within a few hundred kilometers) of Phobos in February 1977 and of Deimos in October 1977. These close encounters were used to estimate the moon's gravitational constant, GM (the universal constant of gravitation multiplied by the satellite mass). However, the Viking and Mariner 9 spacecraft made numerous flybys of Phobos and Deimos at distances of a few thousand kilometers. The tracking data from these more 'distant' encounters were processed to estimate the masses of Mars, Phobos, and Deimos. Author (revised)

MODELS OF THERMAL/CHEMICAL BOUNDARY LAYER CONVECTION: POTENTIAL APPLICATION TO VENUS Abstract Only

A. Lenardic and W. M. Kaula *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 863-864 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The upper boundary layer of Venus is comprised of at least two distinct chemical components, mantle and crust. Fluid dynamical models of convection within Venus' mantle were primarily of the thermal boundary layer type. Models assessing the ability of convective mantle flows to deform the crust were undertaken, but models exploring the effects of a variable thickness crust on mantle convection were largely lacking. A Venusian crust of variable thickness could couple back into, and alter, the mantle flow patterns that helped create it, leading to deformation mechanisms not predicted by purely thermal boundary layer convection models. This possibility is explored through a finite element model of thermal/chemical boundary layer convection. Model results suggest that a crust of variable thickness can serve as a mantle flow driver by perturbing lateral temperature gradients in the upper mantle. Resulting mantle flow is driven by the combination of free convective and nonuniform crustal distribution. This combination can lead to a flow instability manifest in the occurrence of

episodic mantle lithosphere subduction initiated at the periphery of a crustal plateau. The ability of a light, near surface, chemical layer to potentially alter mantle flow patterns suggest that mantle convection and the creation and/or deformation of such a chemical layer may be highly nonseparable problems on time scales of 10(exp 8) years. Author (revised)

ON THE RELATIONSHIP BETWEEN TECTONIC PLATES AND THERMAL MANTLE PLUME MORPHOLOGY Abstract Only **c46**
A. Lenardic and W. M. Kaula *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 865-866 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Models incorporating plate-like behavior, i.e., near uniform surface velocity and deformation concentrated at plate boundaries, into a convective system, heated by a mix of internal and basal heating and allowing for temperature dependent viscosity, were constructed and compared to similar models not possessing plate-like behavior. The simplified numerical models are used to explore how plate-like behavior in a convective system can effect the lower boundary layer from which thermal plumes form. A principal conclusion is that plate-like behavior can significantly increase the temperature drop across the lower thermal boundary layer. This temperature drop affects the morphology of plumes by determining the viscosity drop across the boundary layer. Model results suggest that plumes on planets possessing plate-like behavior, e.g., the Earth, may differ in morphologic type from plumes on planets not possessing plate-like behavior, e.g., Venus and Mars. HELLAS BASIN, MARS: FORMATION BY OBLIQUE IMPACT Abstract Only
Gregory J. Leonard and Kenneth L. Tanaka *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 867-868 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Hellas, a 2,000-km-diameter, roughly circular multiring impact basin in the southern highlands of Mars, has a pronounced southeastern lobe of rim material that extends for some 1,500 km. This lobe and a system of ridges concentric to the southern part of the basin (including part of the lobe) were interpreted to be formed by an oblique impact that was inclined in the direction of the lobe. Our preliminary geologic mapping of the Hellas region (lat -20 to -65 deg, long 250 to 320 deg) at 1:5,000,000 scale gives this hypothesis additional supporting evidence, including a symmetric distribution of basin ejecta and volcanic centers across the inferred trend of the impact. Furthermore, measurements of relief indicate that the downrange ejecta may be about twice as thick as they are elsewhere around the rim. Author (revised)

MAPPING THE STABILITY REGION OF THE 3:2 NEPTUNE-PLUTO RESONANCE Abstract Only
H. F. Levison and S. A. Stern *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 869-870 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Pluto and Charon are most likely the remnants of a large number of objects that existed in the Uranus-Neptune region at early epochs of the solar system. Numerical integrations have shown that, in general, such objects were ejected from the planetary region on timescales of approximately 10(exp 7) years after Neptune and Uranus reached their current masses. It is thought that the Pluto-Charon system survived to current times without being dynamically removed in this way because it is trapped in a set of secular and mean motion resonances with Neptune. The best-known Pluto-Neptune orbit coupling is the 3:2 mean motion resonance discovered almost 30 years ago by C. Cohen and E. Hubbard. These workers showed that the resonance angle, delta is equivalent to 3(lambda(sub P)) - 2(lambda(sub N)) - omega-bar(sub P) where omega-bar(sub P) is the longitude of perihelion of the Pluto-Charon system, and lambda(sub N) and lambda(sub P) are the mean longitude of Neptune and Pluto-Charon respectively, librates about 180 deg with an amplitude, A(sub delta), of 76 deg. A numerical simulation project to map out the stability region of the 3:2 resonance is reported. The results of these simulations are important to understanding whether Pluto's long-term heliocentric stability requires only the 3:2 resonance, or whether it instead requires one or more of the other Pluto-Neptune resonances. Our study also has another important application. By investigating stability timescales as a function of orbital elements, we gain insight into the fraction of orbital phase space which the stable 3:2 resonance occupies. This fraction is directly related to the probability that the Pluto-Charon system (and possibly other small bodies) could have been captured into this resonance. Author (revised)

POSSIBLE DUST CONTAMINATION OF THE EARLY SOLAR SYSTEM Abstract Only **c90**
E. H. Levy and T. V. Ruzmaikina *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 871-872 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Measurements carried out over more than twenty years indicate a deficiency of neutrinos emitted from the deep interior of the Sun in conjunction with the neutrino flux expected from canonical solar models. The early measurements were sensitive only to high-energy neutrinos emitted from B-8 on a minor branch of the energy-producing nuclear reactions in the solar interior. Thus these measurements were not widely considered to be a definitive test of solar physics. However the more recent measurements, which are sensitive to lower energy neutrinos, produced primarily by the p-p reaction on the main energy-producing branch of the solar nuclear reactions, pose a far more significant mystery in physics. One possibility is that the Sun's interior opacity is lower than expected due to a paucity of elements. This paper discusses that the Sun formed from material less abundant in heavy elements than usually believed, and the subsequent contamination due to the settling of surrounding dust brought the abundance of heavy elements - in the protoplanetary nebula, and in the Sun's convective envelope - up to the currently observed value. A SEARCH FOR NOBLE-GAS EVIDENCE FOR PRESOLAR OXIDE GRAINS Abstract Only **c25**
Roy S. Lewis and B. Srinivasan *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 873-874 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Early results from an ongoing search for isotopically distinctive noble gases as evidence for presolar oxide grains are presented. With some qualifications, we do not see such evidence in spinel rich acid residue fractions from the Allende meteorite. We remain hopeful that less abundant mineral separates may yet be fruitful. Presolar grains, micro-diamonds, silicon carbide, and graphite, were found in primitive meteorites. While the abundances of these three refractory C rich grains are low, a few hundred ppm, a few ppm, & less than 1 ppm, respectively in primitive meteorites, they are tagged with high concentrations of isotopically anomalous noble gas components, Xe-HL, KR & Xe-s and Ne-E(H), and Ne-E(L). These tags have served as tracers and allowed the development of techniques for their purification and eventual identification. One might expect similar amounts of refractory presolar oxides to have survived, but so far only three cases exist for their identification. The first two cases are individual corundum oxide grains. Huss et al. found one such grain from an Orgueil residue with an Al-26/Al-27 ratio of 8.9 x 10(exp -5), about 18 times higher than the canonical initial solar system value. The second corundum grain, from Murchison, was found by Nittler et al. to have unusual oxygen in addition to a similar Al-26/Al-27 ratio of 8.7 x 10(exp -4). The oxygen was depleted in O-18 by 22 percent and enriched in O-17 by a factor of 2. The third case is a measurement by Zinner et al. on an aggregate of fine grained spinels from a Murray residue with an O-17 enrichment and a possible O-18 depletion similar to the second grain, but much subdued. This is consistent with a few such presolar grains diluted by a much larger population of isotopically normal corundum grains and an even larger number of normal spinel grains. Author (revised)

THE SEISMIC RESPONSE OF AN AQUIFER TO THE PROPAGATION OF AN IMPACT GENERATED SHOCK WAVE: A POSSIBLE TRIGGER OF THE MARTIAN OUTFLOW CHANNELS? Abstract Only
Ivett A. Leyva and Stephen M. Clifford (Lunar and Planetary Inst., Houston, TX.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 875-876 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Aquifer dilation from shock waves produced by the 8.4 magnitude Alaskan earthquake of 1964 led to water and sediment ejection from the ground up to 400 km away from the earthquake's epicenter. Groundwater disturbances were observed as far away as Perry, Florida (approximately 5500 km), where well water fluctuations with an amplitude of as much as 2.3 m were reported. The martian cratering record provides evidence that the planet has experienced numerous seismic events of a similar, and often much greater, magnitude. Given this fact, and the photogeologic evidence for abundant water in the early crust, the response of a basalt aquifer to the propagation of compressional waves (P-waves) produced by impacts in the 33-1000 km diameter size range were investigated. The resulting one-dimensional changes in effective stress and pore pressure were calculated - as a function of both distance and time - based on the following assumptions: (1) that all of the seismic energy radiated by an impact is transmitted as a single compressional wave; (2) that both the host rock and groundwater are compressible; and (3) that there is no net flow between the water-filled pores. INAA OF CAIs FROM THE MARALINGA CK4 CHONDRITE: EFFECTS OF PARENT BODY THERMAL METAMORPHISM Abstract Only c90
D. J. Lindstrom, L. P. Keller, and R. R. Martinez (Lockheed Engineering and Sciences Co., Houston, TX.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 877-878 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Maralinga is an anomalous CK4 carbonaceous chondrite which contains numerous Ca-, Al-rich inclusions (CAI's) unlike the other members of the CK group. These CAI's are characterized by abundant green hercynitic spinel intergrown with plagioclase and high-Ca clinopyroxene, and a total lack of melilite. Instrumental Neutron Activation Analysis (INAA) was used to further characterize the meteorite, with special focus on the CAI's. High sensitivity INAA was done on eight sample disks about 100-150 microns in diameter obtained from a normal 30 micron thin section with a diamond microcoring device. The CAI's are enriched by 60-70X bulk meteorite values in Zn, suggesting that the substantial exchange of Fe for Mg that made the spinel in the CAI's hercynitic also allowed efficient scavenging of Zn from the rest of the meteorite during parent body thermal metamorphism. Less mobile elements appear to have maintained their initial heterogeneity. Author (revised)

SPACESHIP EARTH: A PARTNERSHIP IN CURRICULUM WRITING Abstract Only c80
Marilyn M. Lindstrom *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 879 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

As the Apollo astronauts left Earth to venture onto the surface of another planetary body, they saw their home planet in a new global perspective. Unmanned NASA missions have given us a closer look at all the other planets in our solar system and emphasized the uniqueness of Earth as the only place in our solar system that can sustain life as we know it. Spaceship Earth is a new science curriculum which was developed to help students and teachers to explore the Earth, to see it in the global perspective, and to understand the relationships among life, the planet, and the sun. Astronaut photographs, especially shuttle pictures, are used as groundbased studies to help students to understand global Earth Science and integrate various aspects of physical, life, and social science. The Spaceship Earth curriculum was developed at by a team of JSC scientists working in collaboration with teachers from local school districts. This project was done under the auspices of Partner-In-Space, a local non-profit organization dedicated to improving science education and our general knowledge of space. The team met once a month for a year then assembled the curriculum during the summer. The project is now in the testing stage as the teachers try it out in their classrooms. It was supported by the Texas Education Agency and will be offered by the State of Texas as a supplemental curriculum for statewide use. Because the curriculum was developed by teachers, it is self contained and the lessons are easy to implement and give students concrete experiences. The three sub-units follow in a logical order, but may be used independently. If they are used separately, they may be tied together by the teacher returning to the basic theme of the global Earth as each unit is completed. Author (revised)

EARTH'S PARTIAL PRESSURE OF CO2 OVER THE PAST 120 Ma; EVIDENCE FROM Ce ANOMALIES IN THE DEEP (GREATER THAN 600 m) PACIFIC OCEAN, 1 Abstract Only c46
Y.-G Liu and R. A. Schmitt *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 883-884 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

It was found that Ce serves as a chemical tracer of paleo-oceanic redox conditions. It was shown that the unoxidized and soluble Ce(3+) in modern seawater exhibits a negative anomaly relative to the other soluble REE(3+). An expression of soluble Ce(3+) in seawater that was approximately 1900X greater than the average observed in Ce in 600-5000 m Pacific seawater was derived. Since Ce(CO3)(+) and Ce(CO3)2(-) complexes greatly exceed the Ce(PO4) complexes in seawater, the formulations of using carbonate complexes were followed and it was found that the calculated Ce and observed concentrations in the deep 600-5000 m Pacific Ocean agree within the uncertainties of the thermodynamic data. As expected, the calculated Ce concentrations are a strong function of pH and found to be lesser functions of CO3(2-) activities. Author (revised)

GEOCHEMICAL EVIDENCES FOR TWO CHONDRITIC-LIKE COMETARY OR ASTEROIDAL IMPACTS BEFORE AND AT THE K/T BOUNDARY Abstract Only c90
Y.-G. Liu and R. A. Schmitt *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 885-886 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

A number of geological and palaeontological evidences support multiple impacts of cometary showers within a short time (approximately 1-3 Ma) and their connection with mass extinctions. Observations include clustered crater ages, stratigraphic horizons of impact ejecta closely spaced in time, and evidence for stepwise mass extinctions spanning intervals of 1-3 Ma. For the K/T boundary, three candidates, Popigai, Manson, and Yucatan, have been proposed as impact craters. Two distinct strata at the K/T boundary in western North America have been interpreted as evidence for two sequential impacts. If multiple impacts occurred within a time span of about 1 Ma then multiple Ir enrichments should be observed. DSDP Hole 577B on the Shatsky Plateau in the northern Pacific at K/T time is the first site. Samples contain approximately greater than 97 percent CaCO3, which exhibit clear chemical signals associated with asteroidal/cometary

impact. Ir, Fe, and Cr data are presented. From the Th-normalized data, two satellite peaks below the major peak at 78 cm and 81 cm of 577B-1-4 are clearly shown. The major Ir peak (K/T boundary) is at 72 cm. Fe and Cr, from C1-like impactor ejecta fallout, also show two peaks at the same positions. For hole 738C on the southern Kerguelen Plateau, Ir values reach a peak concentration of 18 ppb in the clay layer at 96.0-96.2 cm in section 20R-5, and gradually tail off. In the sample 115 cm above the boundary, Ir concentrations have still not reached background levels. From the Ir peak downward to the lowermost sample analyzed at 102 cm, the Ir concentration is still as high as 1.7 ppb. From the Th-normalized data, we observe a small Ir/Th peak at 100-101 cm. Though this peak is within the error margin, the trend is clear. Fe and Cr exhibit the same pattern. The third case is Hole 690C on the Queen Maud Ridge. Again, the Ir/Th plot indicates the strong possibility of satellite peaks at approximately 52 cm. The main peak is at 39-40 cm. For the Stevns Klint K/T boundary layers, the stratification of trace elements appears threefold with peak concentrations in sublayers A1, A3, and B2 for different element groups, including Ir. C1 ratios for many siderophile elements found in combined layers III and IV, corresponding to layers A, B, C, and D, strongly support the impact hypothesis. Also, multiple Ir anomalies in the K/T section at Lattengebirge, Bavarian Alps are reported. Recent works on Ni-rich spinels and Ir at the K/T boundaries clearly establish cometary/asteroidal impacts at the K/T boundary. Lastly, cometary showers can explain the enhanced Ir contents over approximately a 1 Ma interval in Gubbio shales. CASI

EARTH'S PARTIAL PRESSURE OF CO2 OVER THE PAST 100-500 Ma; EVIDENCE FROM Ce ANOMALIES IN MOSTLY SHALLOW SEAS (LESS THAN 200 m) AS RECORDED IN CARBONATE SEDIMENTS, 2 Abstract Only **c45**

Y.-G. Liu, J. W. Reinhardt (Erlangen-Nuremberg Univ., Germany.), and R. A. Schmitt *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 887-888 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

We reported the direct relationship of Ce anomalies recorded in 0.2-119 Ma CaCO3 sediments (Ce(sup A*)) to the Ce anomalies in the parental Pacific deep seawater (Ce(sup A)) and their relationship to atmospheric P(CO2) relative to present P(CO2). We have analyzed continental CaCO3 samples that were deposited in ancient oceans and shallow sea platforms less than 200 m over central USA, central Europe, China, and Saudi-Arabia/Oman. We have plotted Ce(sup A*) over the 75-470 Ma interval. For P(CO2) calculations, we assumed as a reference standard the less than 200 m mixed Pacific Ocean with a Ce(sup A) geometric mean of 0.22 and a range of 0.10-0.43. Because P(CO2) values obtained from reliable deep Pacific Ocean carbonates in the 67-119 Ma interval were similar to the present P(CO2) values, we have drawn a 1.0 ratio for that interval. Although there is considerable scatter among the approximately 150 Ma carbonates, the average Ce(sup A*) value suggests that P(CO2) increased during the early Cretaceous, from 1.0X at approximately 120 Ma to about 1.4X at approximately 150 Ma. At approximately 250 Ma, the average Ce(sup A*) in 13 shallow sea China carbonates agrees well with the single and more reliable approximately 250 Ma China carbonate deposited in deeper open platform. We suggest that P(CO2) ranged from 1.4-1.7X over the Jurassic and Triassic periods. At approximately 280 Ma, three China carbonates deposited in deeper open platforms and therefore considered more reliable are consistent with a European carbonate, which indicate Ce(sup A) and P(CO2) values similar to the present. The minimum at this time corresponds to the great Permo-Carboniferous glaciation. From 280 Ma to 470 Ma, the trend favors increasing Ce(sup A*) and corresponding P(CO2) values between 1.9-2.7X, with a more reliable value closer to 2.7X at 430 Ma because of the unknown higher temperature in the less than 100 m seawater over continental USA which was located just south of the equator at approximately 430 Ma. NOBLE GASES IN TWENTY YAMATO H-CHONDRITES: COMPARISON WITH ALLAN HILLS CHONDRITES AND MODERN FALLS Abstract Only **c90**

Th. Loeken, P. Scherer, and L. Schultz *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 889-890 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Concentration and isotopic composition of noble gases have been measured in 20 H-chrondrites found on the Yamato Mountains ice fields in Antarctica. The distribution of exposure ages as well as of radiogenic He-4 contents is similar to that of H-chrondrites collected at the Allan Hills site. Furthermore, a comparison of the noble gas record of Antarctic H-chrondrites and finds or falls from non-Antarctic areas gives no support to the suggestion that Antarctic H-chrondrites and modern falls derive from differing interplanetary meteorite populations. THE FIRST LUNAR OUTPOST: THE DESIGN REFERENCE MISSION AND A NEW ERA IN LUNAR SCIENCE Abstract Only **c12**

Gary E. Lofgren *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 891-892 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The content of the First Lunar Outpost (FLO) Design Reference Mission has been formulated and a 'strawman' science program has been established. The mission consists of two independent launches using heavy lift vehicles that land directly on the lunar surface. A habitat module and support systems are flown to the Moon first. After confirmation of a successful deployment of the habitat systems, the crewed lunar lander is launched and piloted to within easy walking distance (2 km) of the habitat. By eliminating the Apollo style lunar orbit rendezvous, landing sites at very high latitudes can be considered. A surface rover and the science experiments will accompany the crew. The planned stay time is 45 days, two lunar days and one night. A payload of 3.3 metric tons will support a series of geophysics, geology, astronomy, space physics, resource utilization, and life science experiments. Sample return is 150 to 200 kg. The rover is unpressurized and can carry four astronauts or two astronauts and 500 kg of payload. The rover can also operate in robotic mode with the addition of a robotics package. The science and engineering experiment strategy is built around a representative set of place holder experiments.

EXPERIMENTALLY REPRODUCED RELICT ENSTATITE IN PORPHYRITIC CHONDRULES OF ENSTATITE CHONDRITE COMPOSITION Abstract Only **c90**

Gary E. Lofgren, John M. DeHart, and Tammy L. Dickinson (National Aeronautics and Space Administration, Washington, DC.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 893-894 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Experiments are presented that test a model for the origin of porphyritic pyroxene (PP) chondrules in enstatite chondrites that contain phenocrysts of enstatite with blue cathodoluminescence (CL) set in a matrix of radial, dendritic enstatite with red CL. Established one-atmosphere, gas-mixing techniques were used. Relict enstatite phenocrysts with blue CL in a matrix of coarsely radial to dendritic enstatite with red CL were successfully produced. The relict crystals are preserved in runs with a melt time of 36 minutes or less at 1537 C. The relicts remain angular with smooth crystal/melt interfaces, and thus melting has occurred uniformly. Partial melting does occur along fractures produced when the blue CL enstatite was initially grown and cooled through the proto/ortho enstatite transition with the attendent volume change. There is either reaction with the melt and diffusion of Mn and Cr into the blue CL En, or there is an overgrowth of red CL En along the fractures. The bulk of the relicts remain blue. The melt enclosing the relicts crystalized to a coarsely radial to dendritic to micro porphyritic texture comprised of enstatite that has a bright red CL with decreasing melt time. The blue CL En has Mn and Cr contents at or below detection limits of the electron probe as described in earlier studies and in natural blue CL En. In the red CL En in this study, the Mn, Al2O3, and Cr are at previously observed levels and the levels change rapidly.

LIQUIDUS EQUILIBRIA OF LUNAR ANALOGS AT HIGH PRESSURE Abstract Only
J. Longhi *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 895-896 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Melting experiments have been performed in the range of 20 to 40 kbar on partially crystallized synthetic glasses in order to test the accuracy of the polybaric fractional fusion model for picritic lunar green glasses. Results show that the model predicts the position of the olivine (ol) + orthopyroxene (opx) liquidus boundary within the uncertainty of the measurements, but that details of the calculations are subject to change because of new crystal/liquid partitioning data for olivine and pyroxene.

THE MONZONORITE-ANORTHOSITE CONNECTION: THE PETROGENESIS OF TERRESTRIAL KREEP Abstract Only **c46**
J. Longhi and J. Vander Auwera (Liege Univ., Belgium.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 897-898 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

There is a suite of rocks typically associated with Proterozoic massif anorthosites that bear some interesting similarities to lunar KREEP. In many cases these rocks are plutonic and have traditionally been referred to as the jotunite-mangerite-+/-charnockite-+/-syenite suite. However, in the Rogaland district of southwestern Norway, where they are referred to as 'monzonorites', these rocks are also present as fine-grained dikes and as the chill margin of a layered intrusion, and thus approximate magmatic liquid compositions are readily obtained by chemical analysis. Monzonorites are typically enriched in incompatible lithophile elements such as K (alkali feldspar is present), the rare earths (REE), and P. They have intermediate to low Mg', low-Ca pyroxene, and more evolved types have low Ti/Sm ratios. Much debate has developed over attempts to explain the link between monzonorites and massif anorthosites. One feature seems clear: monzonorites and associated anorthosites have different initial isotopic ratios, so a simple relation is not possible. However, there is apparently a continuum in major elements between the monzonorites and gabbros believed to represent magmas parental to the anorthosites. This continuum suggests a link via high pressure fractionation coupled with assimilation. Although more complicated, this scenario is similar to that evoked for the early Moon: following the formation of ferroan anorthosites, continued fractional crystallization of the residual liquids at the base of the crust led to the formation of KREEP. An attempt is made here to establish a link between monzonorites and high-Al gabbros which are nearly always found as ancillary intrusions associated with anorthosites, and which may record processes in lower crustal magma chambers.

MARTIAN LAVAS: THREE COMPLEMENTARY REMOTE SENSING TECHNIQUES TO DERIVE FLOW PROPERTIES Abstract Only
R. Lopes-Gautier, B. C. Bruno (Hawaii Univ., Honolulu.), G. J. Taylor (Hawaii Univ., Honolulu.), S. Rowland, and C. R. J. Kilburn (Lancaster Univ., England.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 899-900 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Several remote sensing techniques have been developed to determine various properties of lava flows. We are currently focusing on three such techniques to interpret Martian lava flows on Alba Patera, which are based on measurements of distal flow lobe widths which can be used to infer silica content; convolution of flow margins which can distinguish between pahoehoe and a'a types of basaltic flows; final flow field dimensions which can be combined with ground slope to derive effusion duration and average effusion rate. These methods are extremely complementary and together provide a more significant and complete understanding of extra-terrestrial lava flows. However, each of these techniques have specific and distinct data requirements.

DENSITIES OF 5-15 MICRON INTERPLANETARY DUST PARTICLES Abstract Only **c90**
S. G. Love, D. J. Joswiak, and D. E. Brownlee *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 901-902 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

We have measured the densities of about 100 5-15 micron stratospheric IDPs. Great care was taken to minimize selection bias in the sample population. Masses were determined using an absolute x-ray analysis technique with a transmission electron microscope, and volumes were found using scanning electron microscope imagery. Unmelted chondritic particles have densities between 0.5 and 6.0 g/cc. Roughly half of the particles have densities below 2 g/cc, indicating appreciable porosity, but porosities greater than about 70 percent are rare. IDPs with densities above 3.5 g/cc usually contain large sulfide grains. We find no evidence of bimodality in the unmelted particle density distribution. Chondritic spherules (melted particles) have densities near 3.5 g/cc, consistent with previous results for deep sea spherules.

RESOLVING TOPOGRAPHIC DETAIL ON VENUS BY MODELING COMPLEX MAGELLAN ALTIMETRY ECHOES Abstract Only
Amy J. Lovell, F. Peter Schloerb, and George E. McGill *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 903-904 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Magellan's altimeter is providing some of the finest resolution topography of Venus achieved to date. Nevertheless, efforts continue to improve the topographic resolution whenever possible. One effort to this end is stereoscopic imaging, which provides topography at scales similar to that of the synthetic aperture radar (SAR). However, this technique requires two SAR images of the same site to be obtained and limits the utility of this method. In this paper, we present another method to resolve topographic features at scales smaller than that of an altimeter footprint, which is more globally applicable than the stereoscopic approach. Each pulse which is transmitted by Magellan's altimeter scatters from the planet and echoes to the receiver, delayed based on the distance between the spacecraft and each surface element. As resolved in time, each element of an altimetry echo represents the sum of all points on the surface which are equidistant from the spacecraft. Thus, individual returns, as a function of time, create an echo profile which may be used to derive properties of the surface, such as the scattering law or, in this case, the topography within the footprint. The Magellan project has derived some of this information by fitting model templates to radar echo profiles. The templates are calculated based on Hagfor's Law, which assumes a smooth, gently undulating surface. In most regions these templates provide a reasonable fit to the observed echo profile; however, in some cases the surface departs from these simple assumptions and more complex profiles are observed. Specifically, we note that sub-footprint topographic relief apparently has a strong effect on the shape of the echo profile. To demonstrate the effects of sub-resolution relief on echo profiles, we have calculated the echo shapes from a wide range of simple topographic models. At this point, our topographic models have emphasized surfaces where only two dominant elevations are contained within a footprint, such as graben, ridges, crater rims, and central features in impact craters.

SEDIMENTATION, VOLCANISM, AND ANCESTRAL LAKES IN THE VALLES MARINERIS: CLUES FROM TOPOGRAPHY Abstract Only
B. K. Lucchitta, N. K. Isbell, and A. Howington-Kraus *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 905-906 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Compilation of a simplified geologic/geomorphic map onto a digital terrain model of Valles Marineris has permitted quantitative evaluations of topographic parameters. The study showed that, if their interior layered deposits are lacustrine, the ancestral Valles Marineris must have consisted of isolated basins. If, on the other hand, the troughs were interconnected

as they are today, the deposits are most likely to volcanic origin, and the mesas in the peripheral troughs may be table mountains. The material eroded from the trough walls was probably not sufficient to form all of the interior layered deposits, but it may have contributed significantly to their formation.

THE CLEMENTINE INSTRUMENT COMPLEMENT Abstract Only **c43**
Paul G. Lucey *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 907-908 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The recent successes of the Galileo solid-state imaging (SSI) experiment at the Moon and Gaspra show the utility of multispectral imaging of planetary objects. 'Clementine' is the planetary community's 'code name' for the SDIO (Space Defense Initiative Organization), mission to the Moon and the asteroid Geographos. This mission is designed as a long term stressing test on sensors and space systems developed for SDIO. In the course of this test Clementine will obtain science data using a varied and powerful array of remote sensing instruments which were developed by or for Lawrence Livermore National Laboratory in Livermore, California. Clementine carries five cameras, one for navigation and four for science experiments. In addition, a laser ranger is included which will serve as a laser altimeter. The Clementine cameras cover a wider range of spatial resolutions and wavelength range than did Galileo and are almost ideally suited to mapping of mafic rock types as are present on the Moon and expected at Geographos. Calibration of the cameras will occur at the sensor calibration laboratory at LLNL. In flight calibrations, using standard stars and other standards should improve the stated accuracies. Signal-to-noise ratios (SNRs) include the following noise sources: shot noise, calibration error, digitization noise, readout noise, and frame transfer noise (where applicable). The achieved SNRs are a balance between detector saturation and acceptable image smear. The 'worst' case uses the longest possible integration times.

MIXING MODEL ANALYSIS OF TELESCOPIC LUNAR SPECTRA Abstract Only
Paul G. Lucey, Beth C. Clark, and B. Ray Hawke *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 909-910 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

We have analyzed very high quality reflectance spectra of the lunar surface from the University of Hawaii lunar spectral data collection using a spectral mixing model. The spectra analyzed are those of 45 mare sites and 75 highland sites. The spectra were selected on the basis of very high signal to noise ratios based on error bars and point to point scatter, and on quality of removal of telluric water bands. The spectral mixing model used 7 components, not all of which were used in each fit. Four of the components were mineral spectra of the orthopyroxene, a clinopyroxene, an olivine and an anorthite, measured at the Brown University's RELAB. All of the minerals were 45-90 micron splits. Lunar soil contains other components which have the effect of reddening and darkening the soil as well as reducing spectral contrast. In addition, lunar soil contains spectral neutral bright material (likely very fine grained feldspar) which serves to reduce spectral contrast and brighten soils. Early attempts to fit many of the spectra pointed out the need for a component which has a very broad smooth absorption feature centered near 1.1 microns. Glass is a good candidate for this component. For the bright component we used a flat reflectance of 70 percent to represent fine grained feldspar. For the 'glass' component we used a telescopic spectrum of a pyroclastic glass present on the Aristarchus plateau which is characterized by a strong smooth band centered at 1.07 microns. In addition to exhibiting the glass band this spectrum is very red and has a low albedo. On the assumption that the dark component and the red component are agglutinates, which is reasonable but not necessarily true, we sought a dark red component. To derive its properties we modelled the spectrum of an Apollo 16 soil (16xxx) and assumed the dark red component to comprise 60 percent of the soil, appropriate to agglutinate abundance in mature soil. We adjusted the albedo and slope of a straight line representing the dark red component until the contrast and albedo of the model spectrum matched the soil spectrum. The mixing was done after conversion to a single scattering albedo.

FIRST RESULTS FROM A LABORATORY FACILITY FOR MEASUREMENT OF EMISSION SPECTRA UNDER SIMULATED PLANETARY CONDITIONS Abstract Only **c25**
Paul G. Lucey, Natalie Domergue-Schmidt, Bradley G. Henderson (Colorado Univ., Boulder.), and Bruce Jakosky (Colorado Univ., Boulder.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 911-912 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

We have developed a laboratory spectroscopic facility for the measurement of emission spectra under simulated planetary conditions. Spectral measurements are made from 6 to 13 microns with a scanning grating monochromator equipped with a HgCdTl detector. An environment chamber in service in Hawaii for several years in which we can control the temperature from 77 K to 500 K, the pressure from 10(exp -5) torr to two atmospheres, has been equipped with a 77 K or 273 K cold shield. The shield serves to minimize light reflected off the sample and to aid in development of thermal gradients for obtaining spectra under conditions simulating the thermal environment of airless bodies. Samples are placed in small cups on a temperature controlled substrate allowing measurements of emission due to heating from below by the substrate, or from illumination from a solar simulation source.

EVOLUTION OF TRITON'S VOLATILE BUDGET Abstract Only
J. I. Lunine *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 913-914 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Triton's volatile budget provides important links to planetary formation processes in the cold outer solar nebula. However, the budget has been modified by processes subsequent to the accretion of this body. It is of interest to assess whether certain formation environments can be ruled out for Triton on the basis of its current volatile abundances, and also to quantify some of the post-accretional processes by which the abundances have been modified.

Many materials and techniques have been developed by the authors to sample the flux of particles in Low Earth Orbit (LEO), and through regular insitu sampling of the flux in LEO, the materials and techniques have produced data which complement the data now being amassed by the Long Duration Exposure Facility (LDEF) research activities. Recent flight experiments on STS-32, STS-44, STS-46, and STS-52 have been conducted to develop an understanding of the spatial density as a function of size (mass) for particle sizes 1x10(exp -6) cm and larger. In addition to the enumeration of particle impacts, it was also the intent of these experiments that hypervelocity particles be captured and returned intact. Measurements were performed post-flight to determine the flux density, diameters, and subsequent effects on various optical, thermal control, and structural materials. During the course of the STS-44 mission, the Space Shuttle corrected its altitude by 26 km to evade a spent upper stage. The results of this near encounter suggests that a cloud of micron sized particles exist in the vicinity of the object. Data also suggest that the flux density is nearly two (2) orders of magnitude higher than background flux. A comparison of the number flux density along with microphotographs of the captured particles will be presented for the referenced shuttle flights.

A remarkable result from the Viking missions was the discovery that the Martian soil is highly magnetic, in the sense that the soil is attracted by a small magnet. The soil was found to adhere almost equally well to a strong and a weak SmCo magnet in the Viking lander backhoe at both landing sites. An array of permanent magnets, with the purpose of establishing if the magnetic particles on Mars are present as discrete or as composite particles, has been constructed. Author

LARGE-SCALE VOLCANISM ASSOCIATED WITH CORONAE ON VENUS Abstract Only
K. Magee Roberts and James W. Head *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 919-920 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The formation and evolution of coronae on Venus are thought to be the result of mantle upwellings against the crust and lithosphere and subsequent gravitational relaxation. A variety of other features on Venus have been linked to processes associated with mantle upwelling, including shield volcanoes on large regional rises such as Beta, Atla and Western Eistla Regiones and extensive flow fields such as Mylitta and Kaiwan Fluctus near the Lada Terra/Lavinia Planitia boundary. Of these features, coronae appear to possess the smallest amounts of associated volcanism, although volcanism associated with coronae has only been qualitatively examined. An initial survey of coronae based on recent Magellan data indicated that only 9 percent of all coronae are associated with substantial amounts of volcanism, including interior calderas or edifices greater than 50 km in diameter and extensive, exterior radial flow fields. Sixty-eight percent of all coronae were found to have lesser amounts of volcanism, including interior flooding and associated volcanic domes and small shields; the remaining coronae were considered deficient in associated volcanism. It is possible that coronae are related to mantle plumes or diapirs that are lower in volume or in partial melt than those associated with the large shields or flow fields. Regional tectonics or variations in local crustal and thermal structure may also be significant in determining the amount of volcanism produced from an upwelling. It is also possible that flow fields associated with some coronae are sheet-like in nature and may not be readily identified. If coronae are associated with volcanic flow fields, then they may be a significant contributor to plains formation on Venus, as they number over 300 and are widely distributed across the planet. As a continuation of our analysis of large-scale volcanism on Venus, we have reexamined the known population of coronae and assessed quantitatively the scale of volcanism associated with them. In particular, we have examined the percentage of coronae associated with volcanic flow fields (i.e., a collection of digitate or sheet-like lava flows extending from the corona interior or annulus); the range in scale of these flow fields; the variations in diameter, structure and stratigraphy of coronae with flow fields; and the global distribution of coronae associated with flow fields. POSSIBLE SOURCES OF H2 TO H2O ENRICHMENT AT EVAPORATION OF PARENT CHONDRITIC MATERIAL Abstract Only **c90**
A. B. Makalkin, V. A. Dorofeyeva, and A. V. Vityazev *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 921-922 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

One of the results obtained from thermodynamic simulation of recondensation of the source chondritic material is that at 1500-1800 K it's possible to form iron-rich olivine by reaction between enstatite, metallic iron and water vapor in the case of (H2O)/(H2) approximately equal to 0.1. This could be reached if the gas depletion in hydrogen is 200-300 times relative to solar abundance. To get this range of depletion one needs some source material more rich in hydrogen than the carbonaceous CI material which is the richest in volatiles among chondrites. In the case of recondensation at impact heating and evaporation of colliding planetesimals composed of CI material, we obtain insufficiently high value of (H2)/(H2O) ratio. In the present paper we consider some possible source materials and physical conditions necessary to reach gas composition with (H2)/(H2O) approximately 10 at high temperature. Author

TIDAL REGIME OF INTACT PLANETOID CAPTURE MODEL FOR THE EARTH-MOON SYSTEM: DOES IT RELATE TO THE ARCHEAN SEDIMENTARY ROCK RECORD? Abstract Only **c90**
Robert J. Malcuit and Ronald R. Winters *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 923-924 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Regardless of one's favorite model for the origin of the Earth-Moon system (fission, coformation, tidal capture, giant-impact) the early history of lunar orbital evolution would produce significant thermal and earth and ocean tidal effects on the primitive earth. Three of the above lunar origin models (fission, coformation, giant-impact) feature a circular orbit which undergoes a progressive increase in orbital radius from the time of origin to the present time. In contrast, a tidal capture model places the moon in an elliptical orbit undergoing progressive circularization from the time of capture (for model purposes about 3.9 billion years ago) for at least a few 10(exp 8) years following the capture event. Once the orbit is circularized, the subsequent tidal history for a tidal capture scenario is similar to that for other models of lunar origin and features a progressive increase in orbital radius to the current state of the lunar orbit. This elliptical orbit phase, if it occurred, should have left a distinctive signature in the terrestrial and lunar rock records. Depositional events would be associated terrestrial shorelines characterized by abnormally high, but progressively decreasing, ocean tidal amplitudes and ranges associated with such an orbital evolution. Several rock units in the age range 3.6-2.5 billion years before present are reported to have a major tidal component. Examples are the Warrawoona, Fortescue, and Hamersley Groups of Western Australia and the Pangola and Witwatersand Supergroups of South Africa. Detailed study of the features of these tidal sequences may be helpful in deciphering the style of lunar orbital evolution during the Archean Eon. Author

ON THE DELIVERY OF PLANETESIMALS TO A PROTOPLANET IN THE SOLAR NEBULA Abstract Only **c90**
Renu Malhotra *In its* Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 925-926 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

A planetesimal moving in the solar nebula experiences an aerodynamic drag which causes its orbit to circularize and shrink. However resonant perturbations from a protoplanet interior to the planetesimal's orbit can counteract both the orbital decay and the damping of the eccentricity: the planetesimal can be captured into an orbital resonance and its eccentricity pumped up to an equilibrium value. The resonance trapping phenomenon is sensitive to several factors and we elaborate on these below. Orbital resonances form (partial) barriers to the transport of planetesimals into the feeding zone of the protoplanet. Here we report on a systematic study of the idealized system of a single protoplanet of mass much larger than the masses of the planetesimals, comparing relevant analytic estimates with numerical simulations. Our principal conclusion is that in a gas-rich environment, the bulk of the solid material delivered to the feeding zone of the protoplanet is in the form of bodies of small radius. Author

TECTONIC RESURFACING OF VENUS Abstract Only
Michael C. Malin, Robert E. Grimm (Arizona State Univ., Tempe.), and Robert R. Herrick (Lunar and Planetary Inst., Houston, TX.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 927-928 (For primary document see N94-16173

03-91)
Avail: CASI HC A01/MF A06

Impact crater distributions and morphologies have traditionally played an important role in unraveling the geologic histories of terrestrial objects, and Venus has proved no exception. The key observations are: mean crater retention age about 500 Ma; apparently random spatial distribution; modest proportion (17 percent) of modified craters; and preferential association of modified craters with areas of low crater density. The simplest interpretation of these data alone is that Venus experienced global resurfacing (assumed to be largely volcanic) prior to 500 Ma, after which time resurfacing rates decreased dramatically. This scenario does not totally exclude present geological activity: some resurfacing and crater obliteration is occurring on part of the planet, but at rates much smaller than on Earth. An alternative endmember model holds that resurfacing is also spatially randomly distributed. Resurfacing of about 1 sq km/yr eliminates craters such that a typical portion of the surface has an age of 500 Ma, but actual ages range from zero to about 1000 Ma. Monte Carlo simulation indicates that the typical resurfacing 'patch' cannot exceed about 500 km in diameter without producing a crater distribution more heterogeneous than observed. Volcanic or tectonic processes within these patches must be locally intense to be able to obliterate craters completely and leave few modified. In this abstract, we describe how global geologic mapping may be used to test resurfacing hypotheses. We present preliminary evidence that the dominant mode of resurfacing on Venus is tectonism, not volcanism, and that this process must be ongoing today. Lastly, we outline a conceptual model in which to understand the relationship between global tectonics and crater distribution and preservation. Author

VENUSIAN PANCAKE DOMES: INSIGHTS FROM TERRESTRIAL VOLUMINOUS SILICIC LAVAS AND THERMAL MODELING Abstract Only
Curtis R. Manley *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 929-930 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The so-called 'pancake' domes, and several other volcanoes on Venus, appear to represent large extrusions of silicic lava. Similar voluminous rhyolite lava flows, often associated with mantle plumes, are known on Earth. Venus' high ambient temperature, and insulation by the dome's brecciated carapace, both act to prolong cooling of a dome's interior, allowing for episodic lava input over an extended period of time. Field relations and aspect ratios of terrestrial voluminous rhyolite lavas imply continuous, non-episodic growth, reflecting tapping of a large volume of dry, anatectic silicic magma. Petrogenetically, the venusian domes may be analogous to chains of small domes on Earth, which represent 'leakage' of evolved material from magma bodies fractionating from much more mafic liquids. Author

Avail: CASI HC A01/MF A06

The new topography and gravitational field data for Venus expressed in spherical harmonics of degree and order up to 50 allow us to analyze the crust-mantle boundary relief and stress state of the Venusian lithosphere. In these models, we consider models in which convection is confined beneath a thick, buoyant lithosphere. We divide the convection regime into an upper mantle and lower mantle component. The lateral scales are smaller than on Earth. In these models, relative to Earth, convection is reflected in higher order terms of the gravitational field. On Venus geoid height and topography are highly correlated, although the topography appears to be largely compensated. We hypothesize that Venus topography for those wavelengths that correlate well with the geoid is partly compensated at the crust-mantle boundary, while for the others compensation may be distributed over the whole mantle. In turn the strong sensitivity of the stresses to parameters of the models of the external layers of Venus together with geological mapping allows us to begin investigations of the tectonics and geodynamics of the planet. For stress calculations we use a new technique of space- and time-dependent Green's response functions using Venus models with rheologically stratified lithosphere and mantle and a ductile lower crust. In the basic model of Venus the mean crust is 50-70 km thick, the density contrast across the crust-mantle boundary is in the range from 0.3 to 0.4 g/cm(exp -3). The thickness of a weak mantle zone may be from 350 to 1000 km. Strong sensitivity of calculated stress to various parameters of the layered model of Venus together with geological mapping and analysis of surface tectonic patterns allow us to investigate the tectonics and geodynamics of the planet. The results are presented in the form of maps of compression-extension and maximum shear stresses in the lithosphere and maps of crust-mantle boundary relief, which can be presented as a function of time. We have modeled the region of Western Aphrodite and the Niobe plains to get reasonable depths of compensation. Crust mantle boundary relief is calculated for Western Aphrodite-Niobe relative to a mean crustal thickness of 50 km. The calculations include the consequences of simple crust models and more complicated models with a weak, ductile lower crust, a strong upper mantle and a weak lower mantle layer. Author

CO2 PRODUCTION BY IMPACT IN CARBONATES? AN ATEM AND STABLE ISOTOPE (C,O) STUDY Abstract Only **c25**
I. Martinez, P. Agrinier, F. Guyot, Ph. Ildefonse, M. Javoy, U. Schaerer, U. Hornemann (Muenster Univ., Germany.), and A. Deutsch (Muenster Univ., Germany.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 933-934 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Carbonates may have been a common target for large impacts on the Earth and possible related CO2 outgassing would have important consequences for the composition of the atmosphere. To estimate volatile release during such impacts, isotopic ratios (C-13/C-12 and O-18/O-16) were determined on highly shocked carbonate samples in combination with SEM and analytical transmission electron microscopy (ATEM) investigations. The study was performed on both naturally and experimentally shocked rocks, i.e. 50-60 GPa shocked limestone-dolomite fragments from the Haughton impact crater (Canada), and carbonates shocked in shock recovery experiments. For the experiments, unshocked carbonates consisting of mixture of dolomite and calcite from the Haughton area were used. Naturally shocked samples were collected in the polymict breccia near the center of the Haughton crater. Author

DUST GRAIN RESONANT CAPTURE: A STATISTICAL STUDY Abstract Only **c90**
F. Marzari, V. Vanzani, and S. J. Weidenschilling (Planetary Science Inst., Tucson, AZ.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 935-936 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

A statistical approach, based on a large number of simultaneous numerical integrations, is adopted to study the capture in external mean motion resonances with the Earth of micron size dust grains perturbed by solar radiation and wind forces. We explore the dependence of the resonant capture phenomenon on the initial eccentricity e(sub 0) and perihelion argument w(sub 0) of the dust particle orbit. The intensity of both the resonant and dissipative (Poynting-Robertson and wind drag) perturbations strongly depends on the eccentricity of the particle while the perihelion argument determines, for low inclination, the mutual geometrical configuration of the particle's orbit with respect to the Earth's orbit. We present results for three j:j+1 commensurabilities (2:3, 4:5 and 6:7) and also for particle sizes s = 15, 30 microns. This study extends our previous work on the long term orbital evolution of single dust particles trapped into resonances with the Earth. Author

EFFECTS OF BULK COMPOSITION ON PRODUCTION RATES OF COSMOGENIC NUCLIDES IN METEORITES Abstract Only **c90**

Jozef Masarik and Robert C. Reedy *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 937-938 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The bulk chemical composition of meteorites has been suggested as a main factor influencing the production of cosmogenic nuclides. Numerical simulations with Los Alamos Monte Carlo production and transport codes were done for Ne-21/Ne-22 ratios and Ar-38 production rates in meteorites with a wide range of compositions. The calculations show that an enhanced flux of low-energy secondary particles in metal-rich phases is the essential key for the explanation of experimentally observed differences in nuclide production processes in various meteorite classes. A DECADE'S OVERVIEW OF IO'S VOLCANIC ACTIVITY Abstract Only **c90**

D. L. Matson, G. J. Veeder, T. V. Johnson, D. L. Blaney, and J. D. Goguen *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 939-940 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Over the past decade some aspects of Io's volcanic activity have changed greatly, while others have essentially remained constant. This contrast has emerged from our study of multi-wavelength, infrared, observations of Io's thermal emission. From 1983 to 1992 we observed the disk integrated flux density of Io from the NASA Infrared Telescope Facility (IRTF) on Mauna Kea, Hawaii. Our spectral coverage allows us to separate out the emission components due to volcanic thermal anomalies which are warmer than the background emission caused by solar heating. Our temporal coverage allows us to resolve individual eruptions and also to obtain the disk-integrated flux density as a function of longitude (or, equivalently, orbital phase angle). Characteristics that persisted over the decade involve Loki's location and intensity of emission, the leading hemisphere emission, and the average heat flow. The variable aspects of Io over the decade include Loki's hotter area(s) and the outbursts in the leading hemisphere. Author

SIZE DISTRIBUTION OF INTERPLANETARY IRON AND STONY PARTICLES RELATED WITH DEEP-SEA SPHERULES Abstract Only **c90**

H. Matsuzaki and K. Yamakoshi *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 943-944 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

To study origin and evolution of the interplanetary dust, it is very important to investigate the size distribution. Here the changes of the size distributions of meteoroid particles due to the ablative effects during atmospheric entry were investigated by numerical computer simulation. Using the results, the pre-atmospheric size distributions of the interplanetary dust particles could be estimated from that of ablated spherules taken from deep-sea sediments. We are now analyzing deep-sea spherules from some aspects and examining if we could get any information about the interplanetary dust. Author

CLASSIFICATIONAL PARAMETERS FOR ACAPULCOITES AND LODRANITES: THE CASES OF FRO 90011, EET 84302 AND ALH A81187/84190 Abstract Only **c90**

T. J. McCoy, K. Keil, R. N. Clayton (Chicago Univ., IL.), and T. K. Mayeda (Chicago Univ., IL.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 945-946 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Acapulcoites and lodranites probably sample a common parent body, which has experienced a range of partial melting. We present classificational parameters which allow acapulcoites-lodranites to be distinguished from other groups of meteorites, as well as from each other. Petrography can complement oxygen isotopic compositions in separating these meteorites from other groups of stony-irons and primitive achondrites, while petrographic properties alone distinguish acapulcoites from lodranites. Acapulcoites differ from lodranites in having smaller grain sizes, abundant Fe, Ni-FeS as micron-sized veins and plagioclase which escaped melting. We have applied these criteria to three new members of the group. FRO 90011 is a typical lodranite; EET 84302 is intermediate in many properties between acapulcoites and lodranites; and ALH A81187/84190 are paired meteorites and are first low-FeO acapulcoites. These meteorites provide a wider spectrum of samples from the acapulcoite-lodranite parent body and suggests that this body may have had a complex structure. Author

The Zagami shergottite is a basaltic meteorite which formed when a phenocryst-bearing lava flow was emplaced at or near the surface of Mars. Recently, a cm-sized olivine-rich lithology has been identified in Zagami by Mossbauer spectroscopy. Olivine is extremely rare in shergottites, particularly in Zagami and Shergotty, where it occurs only as minute grains. We report petrologic and microprobe studies of this olivine-rich lithology. This material represents the last few percent of melt and is highly enriched in phosphates, opaques and mesostases, all of which are late-stage crystallization products. Phosphates replaced augite as a phenocryst phase when the magma became saturated in P. This late stage melt also includes a fayalite-bearing, multi-phase intergrowth which crystallized after the melt became too rich in iron to crystallize pigeonite. We can now reconstruct the entire crystallization history of the Zagami shergottite from a deep-seated magma chamber to crystallization of the final few percent of melt in a near-surface dike or thick flow. Small pockets (tens of microns) of late-stage melt pockets are ubiquitous but volumetrically minor in Zagami. We do not know the physical relationship between these areas and the cm-sized olivine-rich material described here. It is possible that these small pockets were mobile, forming larger areas. Perhaps inspection of the entire hand specimen of Zagami would clarify this relationship. Derived from text

RESOLVING LDEF'S FLUX DISTRIBUTION: ORBITAL (DEBRIS?) AND NATURAL METEOROID POPULATIONS Abstract Only **c90**

J. A. M. McDonnell *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 949-950 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

A consistent methodology for the collation of data from both penetration and perforation experiments and from data in the Meteoroid and Debris Special Investigator Group (M-D SIG) data-base has led to the derivation of the average impact flux over LDEF's exposure history 1984-1990. Data are first presented for LDEF's N,S,E,W and Space faces ('offset' by 8 deg and 'tilted' by 1 deg respectively). A model fit is derived for ballistic limits of penetration from 1 micron to 1mm of aluminium target, corresponding to impactor masses from 10(exp -18) kg (for rho sub p = 2g/cu cm) to 10(exp -10) kg (for rho sub p = 1g/cu cm). A second order harmonic

function is fitted to the N,S,E, and W fluxes to establish the angular distribution at regular size intervals; this fit is then used to provide 'corrected' data corresponding to fluxes applicable to true N,S,E,W and Space directions for a LEO 28.5 degree inclination orbit at a mean altitude of 465 km.

CLEMENTINE: ANTICIPATED SCIENTIFIC DATASETS FROM THE MOON AND GEOGRAPHOS Abstract Only
A. S. McEwen *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 951-952 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The Clementine spacecraft mission is designed to test the performance of new lightweight and low-power detectors developed at the Lawrence Livermore National Laboratory (LLNL) for the Strategic Defense Initiative Office (SDIO). A secondary objective of the mission is to acquire useful scientific data, principally of the Moon and the near-Earth asteroid Geographos. The spacecraft will be in an elliptical polar orbit about the Moon for about 2 months beginning in February of 1994 and it will fly by Geographos on August 31. Clementine will carry seven detectors each weighing less than about 1 kg: two Star Trackers wide-angle uv/vis wide-angle Short Wavelength IR (SWIR) Long-Wavelength IR (LWIR) and LIDAR (Laser Image Detection And Ranging) narrow-angle imaging and ranging. Additional presentations about the mission detectors and related science issues are in this volume. If fully successful Clementine will return about 3 million lunar images, a dataset with nearly as many bits of data (uncompressed) as the first cycle of Magellan and more than 5000 images of Geographos. The complete and efficient analysis of such large data sets requires systematic processing efforts. Described below are concepts for two such efforts for the Clementine mission: global multispectral imaging of the Moon and videos of the Geographos flyby. Other anticipated datasets for which systematic processing might be desirable include multispectral observations of Earth; LIDAR altimetry of the Moon with high-resolution imaging along each ground track; high-resolution LIDAR color along each lunar ground track which could be used to identify potential titanium-rich deposits at scales of a few meters; and thermal IR imaging along each lunar ground track (including nighttime observations near the poles).

GLOBAL AND REGIONAL/SEASONAL COLOR MOSAICS OF MARS Abstract Only
Alfred S. McEwen and Laurence A. Soderblom *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 953-954 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Four regional mosaics of Mars acquired during different seasons, along with their composite as a single global mosaic, have been completed in two colors (red and violet) at scales of 1/16 and 1/64 degrees/pixel. These mosaics were put together from a set of 51 separate mosaics, each acquired from a single Viking orbiter spacecraft orbital revolution. Special techniques were developed and applied to suppress large variations between mosaics introcued by highly variable, optically thin, condensate hazes. The techniques utilize a combination of the spatial characteristics of the hazes (generally broad, low-frequency) along with their modulation of the reginal color ratios (strongly enhancing the violet/red ratios). Photometric-function normalization was applied following the haze removal. Most of the single-orbit mosaics consist of red and violet or red, green, and violet filters, but a few mosaics with only red-filter data were included to fill gaps in global coverage at high northern latitudes. Global coverage is approximately 99 percent complete in red-filter mosaics and approximately 95 percent and approximately 60 percent complete in corresponding violet- and green-filter mosaics, respectively. All of the mosaics are geometrically tied to the 1/256 deg per pixel Mars Digital Image Map (MDIM), which is available on Compact Disk (CD), and which will be used as the base map for Mars Observer data sets. Early in 1993, the single-orbit color mosaics will be distributed to the science community in a six-volume set of CDs. Perhaps the most scientifically interesting parts of this dataset are the overlap regions, which show significant temporal variations in surface and atmospheric features. Surface changes can be categorized as (1) changes that probably occurred during the great dust storms of 1977; (2) changes that occurred soon after 1977 storms due to removal of redistribution of recently deposited dust; (3) changes in the northern lowlands that probably occurred during the dusty southern summer of 1979 (when no great dust storm occurred); and (4) changes associated with strong slope winds in the Tharsis and Elysium regions.

LUNAR MULTISPECTRAL MOSAICS FROM GALILEO'S SECOND EARTH-MOON FLYBY Abstract Only
A. S. McEwen, T. L. Becker, M. S. Robinson (Hawaii Univ., Honolulu.), K. P. Klaasen (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), C. Heffernan (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), and J. M. Sunshine (Brown Univ., Providence, RI.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 955-956 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Galileo's Solid-State Imaging (SSI) experiment acquired about 800 images of the Moon from the second Earth-Moon flyby (EM2) in December of 1992. Ten major sequences were acquired; each consists of mosaics of the entire or nearly entire visible and illuminated surface from each viewing geometry in at least six spectral filters (effective wavelengths for the Moon of 420, 564, 660, 756, 890, and 990 nm). The geometries of LUNMOS numbers 3, 4, 5, and 6 were designed to provide stereo data at the best possible resolutions. The purpose of this abstract is to describe the sequences, calibration, processing, and mosaicking, and to present a set of color products in a poster session.

GALILEO SSI LUNAR OBSERVATIONS: COPERNICAN CRATERS AND SOILS Abstract Only
A. S. McEwen, R. Greeley (Arizona State Univ., Tempe.), James W. Head (Brown Univ., Providence, RI.), C. M. Pieters (Brown Univ., Providence, RI.), E. M. Fischer (Brown Univ., Providence, RI.), T. V. Johnson (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), and G. Neukum (Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Berlin, Germany.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 957-958 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The Galileo spacecraft completed its first Earth-Moon flyby (EMI) in December 1990 and its second flyby (EM2) in December 1992. Copernican-age craters are among the most prominent features seen in the SSI (Solid-State Imaging) multispectral images of the Moon. The interiors, rays, and continuous ejecta deposits of these youngest craters stand out as the brightest features in images of albedo and visible/1-micron color ratios (except where impact melts are abundant). Crater colors and albedos (away from impact melts) are correlated with their geologic emplacement ages as determined from counts of superposed craters; these age-color relations can be used to estimate the emplacement age (time since impact event) for many Copernican-age craters on the near and far sides of the Moon. The spectral reflectivities of lunar soils are controlled primarily by (1) soil maturity, resulting from the soil's cumulative age of exposure to the space environment; (2) steady-state horizontal and vertical mixing of fresh crystalline materials ; and (3) the mineralogy of the underlying bedrock or megaregolith. Improved understanding of items (1) and (2) above will improve our ability to interpret item (3), especially for the use of crater compositions as probes of crustal stratigraphy. We have examined the multispectral and superposed crater frequencies of large isolated craters, mostly of Eratosthenian and Copernican ages, to avoid complications due to (1) secondaries (as they affect superposed crater counts) and (2) spatially and temporally nonuniform regolith mixing from younger, large, and nearby impacts. Crater counts are available for 11 mare craters and 9 highlands craters within the region of the Moon imaged during EM1. The EM2 coverage provides multispectral data for 10 additional craters with superposed crater counts. Also, the EM2 data provide improved spatial resolution and signal-to-noise ratios over the western nearside.

Analytic solutions for the responses of planetary lithospheres to volcanic loads have been used to model faulting and infer elastic plate thicknesses. Predictions of the distribution of faulting around volcanic loads, based on the application of Anderson's criteria for faulting to the results of the models, do not agree well with observations. Such models do not give the stress state in the load itself, but only suggest a state of horizontal compressive stress there. Further, these models have considered only the effect of an instantaneously emplaced load. They do not address the time evolution of stresses, nor do they consider the effect of a load which grows. A finite element approach allows us to assign elements to the load itself, and thus permits calculation of the stress state and stress history within the edifice. The effects of episodic load growth can also be treated. When these effects are included, models give much better agreement with observations. We use the finite element code TECTON to construct axisymmetric models of volcanoes resting on an elastic lithospheric plate overlying a viscoelastic asthenosphere. We have implemented time-dependent material properties in order to simulate incremental volcano growth. The viscoelastic layer was taken to extend to a sufficient depth so that a rigid lower boundary has no significant influence on the results. The code first calculates elastic deformations and stresses and then determines the time-dependent viscous deformations and stresses. Time in the model scales as the Maxwell time tau(m) in the asthenosphere. We consider a volcano 25 km in height and 200 km in radius on an elastic lithosphere 40 km thick (parameters approximately appropriate to Ascraeus Mons). The volcano consists of three load increments applied at intervals of 1000 tau(m). Contours of maximum deviatoric stress in the fully-grown edifice at the conclusion of flexure (t = 3000 tau(m)) are shown. Derived from text

GRAIN SURFACE FEATURES OF APOLLO 17 ORANGE AND BLACK GLASS Abstract Only
David S. McKay and Sue J. Wentworth (Lockheed Engineering and Sciences Co., Houston, TX.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 961-962 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Lunar soil sample 74220 and core samples 74001/2 consist mainly of orange glass droplets, droplet fragments, and their crystallized equivalents. These samples are now generally accepted to be pyroclastic ejecta from early lunar volcanic eruptions. It has been known that they contain surface coatings and material rich in volatile condensable phases including S, Zn, F, Cl, and many volatile metals. Meyer summarizes the voluminous published chemical data and calculates the volatile enrichment ratios for most of the surface condensates. In an attempt to more completely understand this enrichment of surface volatiles, we have searched for carbon and carbon-bearing phases on droplet surfaces. We have reviewed many of our existing photomicrographs and energy dispersive analysis (EDX) of grain surfaces and have reexamined some of our older SEM mounts using an improved EDXA system capable of light element detection and analysis (oxygen, nitrogen, and carbon). In addition, we have made fresh mounts using procedures which should minimize carbon contamination or extraneous carbon x-rays and have analyzed for carbon. Derived from text

JSC-1: A NEW LUNAR REGOLITH SIMULANT Abstract Only
David S. McKay, James L. Carter (Texas Univ., Dallas.), Walter W. Boles (Texas A&M Univ., College Station.), Carlton C. Allen (Lockheed Engineering and Sciences Co., Houston, TX.), and Judith H. Allton (Lockheed Engineering and Sciences Co., Houston, TX.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 963-964 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Simulants of lunar rocks and soils with appropriate properties, although difficult to produce in some cases, will be essential to meeting the system requirements for lunar exploration. In order to address this need a new lunar regolith simulant, JSC-1, has been developed. JSC-1 is a glass-rich basaltic ash which approximates the bulk chemical composition and mineralogy of some lunar soils. It has been ground to produce a gain size distribution approximating that of lunar regolith samples. The simulant is available in large quantities (greater than 2000 lb; 907 kg). JSC-1 was produced specifically for large- and medium-scale engineering studies in support of future human activities on the Moon. Such studies include material handling, construction, excavation, and transportation. The simulant is also appropriate for research on dust control and spacesuit durability. JSC-1 can be used as a chemical or mineralogical analog to some lunar soils for resource studies such as oxygen or metal production, sintering, and radiation shielding. Derived from text

THE NAKHLA PARENT MELT: REE PARTITION COEFFICIENTS AND CLUES TO MAJOR ELEMENT COMPOSITION Abstract Only **c90**
G. McKay, L. Le (Lockheed Engineering and Sciences Co., Houston, TX.), and J. Wagstaff (Lockheed Engineering and Sciences Co., Houston, TX.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 965-966 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Nakhla is one of the SNC meteorites, generally believed to be of Martian origin. It is a medium-grained augite-olivine cumulate with a variolitic groundmass of sodic plagioclase, alkali feldspar, and Fe-rich pyroxenes and olivine. One of the major tasks in deciphering Nakhla's petrogenesis is determining the composition of its parent melt. Gaining an understanding of the composition and petrogenesis of this parent melt may help unravel Nakhla's relationship to the other SNCs, and provide clues to Martian petrogenesis in general. Our experimental partitioning studies provide new information that helps constrain both the major and trace element composition of the Nakhla parent melt. Author

MORE ON THE COOLING HISTORY OF ANGRITE LEW 86010 Abstract Only **c90**
G. McKay, T. Ogawa (Tokyo Univ., Japan.), M. Miyamoto (Tokyo Univ., Japan.), and H. Takeda (Tokyo Univ., Japan.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 967-968 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Antarctic angrite LEW 86010 has many chemical and mineralogical characteristics which suggest it is closely related to Angra dos Reis (ADOR). However, these meteorites have had very different thermal histories. Olivines and pyroxenes in ADOR are nearly homogeneous, suggesting very slow cooling or extensive subsolidus equilibration. In contrast, LEW 86010 pyroxenes are extensively zoned in both major and trace elements, while olivines are nearly homogeneous, suggesting that cooling of this sample was slow enough to homogenize olivines, but too fast to homogenize pyroxenes. In an earlier study, we used Ca diffusion gradients associated with exsolution lamellae of kirsh-steinite in LEW 86010 olivines to estimate the cooling rate of this sample. We obtained cooling rates of a few x.01 deg C/yr, corresponding to a burial depth of approximately 10(exp 2) m under solid rock (thermal diffusivity = 0.004 sq cm/s), or approximately m under regolith material (10(exp -5) sq cm/s). Unfortunately, this calculation was very sensitive to the assumed temperature of initial exsolution, which we approximated from the estimated initial olivine bulk Ca content, and also to the extrapolated values for the Ca diffusion coefficient (D sub Ca). This abstract reports new cooling rate estimates obtained using a refined approach that includes the initial temperature of exsolution as one of the fitted parameters. The purpose of our new calculations is (1) to reduce uncertainties in cooling rate due to uncertainties in bulk olivine Ca content and initial exsolution temperature, (2) to investigate the effects of using different values for D sub Ca, and (3) to determine how well constrained the cooling rate is for any particular Ca diffusion coefficient.

LIMITED SUBSOLIDUS DIFFUSION IN TYPE B1 CAI: EVIDENCE FROM TI DISTRIBUTION IN SPINEL Abstract Only **c25**
G. P. Meeker, J. E. Quick, and Julie M. Paque (National Aeronautics and

Space Administration. Ames Research Center, Moffett Field, CA.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 969-970 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Most models of calcium aluminum-rich inclusions (CAI) have focused on early stages of formation by equilibrium crystallization of a homogeneous liquid. Less is known about the subsolidus cooling history of CAI. Chemical and isotopic heterogeneties on a scale of tens to hundreds of micrometers (e.g. MacPherson et al. (1989) and Podosek, et al. (1991)) suggest fairly rapid cooling with a minimum of subsolidus diffusion. However, transmission electron microscopy indicates that solid state diffusion may have been an important process at a smaller scale (Barber et al. 1984). If so, chemical evidence for diffusion could provide constraints on cooling times and temperatures. With this in mind, we have begun an investigation of the Ti distribution in spinels from two type B1 CAI from Allende to determine if post-crystallization diffusion was a significant process. The type B1 CAIs, 3529Z and 5241 have been described by Podosek et al. (1991) and by El Goresy et al. (1985) and MacPherson et al. (1989). We have analyzed spinels in these inclusions using the electron microprobe. These spinels are generally euhedral, range in size from less than 10 to 15 micron and are poikilitically enclosed by millimeter-sized pyroxene, melilite, and anorthite. Analyses were obtained from both the mantles and cores of the inclusions. Compositions of pyroxene in the vicinity of individual spinel grains were obtained by analyzing at least two points on opposite sides of the spinel and averaging the compositions. The pyroxene analyses were obtained within 15 microns of the spinel-pyroxene interface. No compositional gradients were observed within single spinel crystals. Ti concentrations in spinels included within pyroxene, melilite, and anorthite are presented.

THE EFFECTS OF ORBITAL AND CLIMATIC VARIATIONS ON MARTIAN SURFACE HEAT FLOW Abstract Only
Michael T. Mellon and Bruce M. Jakosky *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 971 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Large changes in the orbital elements of Mars on timescales of 10(exp 4) to 10(exp 6) years will cause widely varying climate, specifically surface temperatures, as a result of varying insolation. These surface temperature oscillations will produce subsurface thermal gradients which contribute to the total surface heat flux. We investigate the thermal behavior of the Martian regolith on orbital timescales and show that this climatological surface heat flux is spatially variable and contributes significantly to the total surface heat flux at many locations. We model the thermal behavior of the Martian regolith by calculating the mean annual surface temperatures for each epoch (spaced 1000 years apart to resolve orbital variations) for the past 200,000 years at a chosen location on the surface. These temperatures are used as a boundary condition for the deeper regolith and subsurface temperature oscillation are then computed. The surface climatological heat flux due to past climate changes can then be found from the temperature gradient between the surface and about 150 m depth (a fraction of the thermal skin depth on these timescales). This method provides a fairly accurate determination of the climatological heat flow component at a point; however, this method is computationally time consuming and cannot be applied to all points on the globe. To map the spatial variations in the surface heat flow we recognize that the subsurface temperature structure will be largely dominated by the most recent surface temperature oscillations. In fact, the climate component of the surface heat flow will be approximately proportional to the magnitude of the most recent surface temperature change. By calculating surface temperatures at all points globally for the present epoch and an appropriate past epoch, and combining these results with a series of more precise calculations described above, we estimate the global distribution of climatological surface heat flow.

EQUATORIAL GROUND ICE ON MARS: STEADY-STATE STABILITY Abstract Only
Michael T. Mellon, Bruce M. Jakosky, and Susan E. Postawko (Oklahoma Univ., Norman.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 973-974 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Current Martian equatorial surface temperatures are too warm for water ice to exist at the surface for any appreciable length of time before subliming into the atmosphere. Subsurface temperatures are generally warmer still and, despite the presence of a diffusive barrier of porous regolith material, it has been shown by Smoluchowski, Clifford and Hillel, and Fanale et al. that buried ground ice will also sublime and be lost to the atmosphere in a relatively short time. We investigate the behavior of this subliming subsurface ice and show that it is possible for ice to maintain at a steady-state depth, where sublimation and diffusive loss to the atmosphere is balanced by resupply from beneath by diffusion and recondensation of either a deeper buried ice deposits or ground water. We examine the behavior of equatorial ground ice with a numercial time-marching molecular diffusion model. In our model we allow for diffusion of water vapor through a porous regolith, variations in diffusivity and porosity with ice content, and recondensation of sublimed water vapor. A regolith containing considerable amounts of ice can still be very porous, allowing water vapor to diffuse up from deeper within the ice layer where temperatures are warmer due to the geothermal gradient. This vapor can then recondense nearer to the surface where ice had previously sublimed and been lost to the atmosphere. As a result we find that ice deposits migrate to find a steady-state depth, which represents a balance between diffusive loss to the atmosphere through the overlying porous regolith and diffusive resupply through a porous icy regolith below. This depth depends primarily on the long-term mean surface temperature and the nature of the geothermal gradient, and is independent of the ice-free porosity and the regolith diffusivity. Only the rate of loss of ground ice depends on diffusive properties.

Avail: CASI HC A01/MF A06

We propose a novel method of remotely observing impacts on the airless Moon that may extend the present data base on meteoroids down to 1 m in diameter. Meteorites or comets of radius approximately 1-100 m are burnt away or dispersed in the atmospheres of the Earth and Venus. However, when such objects strike the Moon they deposit their energy in a small initial volume, forming a plasma plume whose visible and infrared radiation may be visible from the Earth. We consider impacts of model SiO2 projectiles on the surface of an SiO2 model Moon.

THERMOGEOLOGIC MAPPING OF THE MOON FROM LUNAR ORBIT Abstract Only
W. W. Mendell and M. A. Wieczorek (State Univ. of New York, Buffalo.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 977-978 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The Infrared Scanning Radiometer (ISR) onboard the Apollo 17 Command-Service Module (CSM) mapped thermal emission of the lunar surface from orbit. Measured temperature values span the diurnal range of lunar temperatures (85 K to 400 K) and have an accuracy of approximately plus or minus 2 K. Surface spatial resolution at nadir is 2.2 km. This Apollo data is being revisited using data presentation software for the Macintosh computer, which was not available 20 years ago, even on mainframes. The new thermal images exhibit subtleties in the delineation of geophysical surface units that were unappreciated in the original survey

of the data. Looking first at nighttime thermal emission from the ground tracks over Oceanus Procellarum to Mare Orientale, we have confirmed and expanded on earlier observations of regolith differences between mare and highlands and of a scheme for relative age-dating of larger impact craters of the Copernican age. We see an impact crater near Lenz, just north of Orientale, which exhibits an extraordinarily fresh ejecta blanket. Photography of this area is extremely poor, but we can see the feature in the Galileo data. We plan to derive geophysical surface properties of the overflown region using thermal models of regolith structures.

DEUCALIONIS REGIO, MARS: EVIDENCE FOR A UNIQUE MINERALOGIC ENDMEMBER AND A CRUSTED SURFACE Abstract Only

E. Merenyi, K. S. Edgett (Arizona State Univ., Tempe.), and R. B. Singer *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 979-980 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

A small equatorial region south of Sinus Meridiani, Deucalionis Regio, has been found spectrally distinct from other regions as seen in a high spectral resolution telescopic image of the meridian hemisphere of Mars. Analysis of Viking IRTM and other related data suggest that Deucalionis Regio has a crusted surface. The crust-bonding minerals may contribute to the spectral uniqueness of this region. Two independent analyses of spectral images, linear spectral mixing and supervised classification based on the spectral shapes, showed that in addition to the well-known spectral endmember regions in this image (western Arabia, south Acidalia, and Sinus Meridiani), Deucalionis Regio has spectral properties that are unique enough to make it a principle endmember unit. In those earlier works, Deucalionis Regio was referred to as 'Meridiani Border.' Analysis of thermal inertia, rock abundance, and albedo information derived from Viking images and Infrared Thermal Mapper (IRTM) data obtained 1977-80 also indicate that Deucalionis Regio has a surface of distinctly different physical properties when compared to Arabia, Sinus Meridiani, and Acidalia. Deucalionis Regio has a thermal inertia equivalent to the Martian average, a low rock abundance (less than 5 percent), and an intermediate albedo and color. Considerable effort by previous investigators has revealed a consistent model for the surface (upper few cm) properties of the endmember reigons Arabia, Sinus Meridiani, and Acidalia. Compared with these regions, we consider that Deucalionis Regio is not a region of either (1) unconsolidated, fine bright dust like Arabia, (2) considerable windblown unconsolidated sand like Sinus Meridiani, or (3) a rocky-and-sandy surface like Acidalia. Thus, we are forced to consider that either the surface of Deucalionis Regio is made of unconsolidated fine to medium sand (about 250 microns) of an unusual and previously unreported color and albedo, or that the surface is crusted, fine-grained weathered soil, and the thermal inertia is an indicator of the degree to which the surface sediments have become indurated. We favor the latter.

DO IT YOURSELF REMOTE SENSING: GENERATING AN INEXPENSIVE, HIGH TECH, REAL SCIENCE LAKE MAPPING PROJECT FOR THE CLASSROOM Abstract Only **c43**

Stephen M. Metzger *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 981-982 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The utilization of modest equipment and software revealed bottom contours and water column conditions of a dynamic water body. Classroom discussions of field techniques and equipment capabilities followed by exercises with the data sets in cause-and-effect analysis all contributed to participatory education in the process of science. This project is presented as a case study of the value of engaging secondary and collegiate level students in planning, executing and appraising a real world investigation which they can directly relate to. A 1 km wide bay, experiencing marsh inflow, along an 8 km long lake situated 120 km north of Ottawa, Canada, on the glaciated Canadian Precambrian Shield was mapped in midsummer for submerged topography, bottom composition, temperature profile, turbudity, dissolved oxygen and biota distribution. Low level aerial photographs scanned into image processing software are permitting spatial classification of bottom variations in biology and geology. Instrumentation consisted of a portable sport fishing SONAR depth finder, an electronic lead line multiprobe with photocell, thermistor and dissolved oxygen sensors, a selective depth water sampler, portable pH meter, an underwater camera mounted on a home-made platform with a bottom-contact trigger and a disposable underwater camera for shallow survey work. Sampling transects were referenced using a Brunton hand transit triangulating several shore markers.

The purpose of the Artemis Program is to gather vital scientific and engineering data by conducting robotic exploration missions on the lunar surface both prior to and concurrent with human missions. The Artemis Program includes rapid, near-term development of a variety of small experimental and operational payloads, a low-cost capacity to deliver these payloads to any location on the lunar surface, and the analysis of the data returned. The Artemis Program will provide opportunities to improve the understanding of lunar geosciences, to demonstrate the Moon's unique capacity as an astronomical platform to study the universe, to conduct scientific and technology development experiments, and to prepare for and complement human missions.

Al-26 PRODUCTION PROFILE AND MODEL COMPARISONS IN CANYON DIABLO Abstract Only **c90**

E. Michlovich, D. Elmore, S. Vogt, M. Lipschutz, J. Masarik (Los Alamos National Lab., NM.), and R. C. Reedy (Los Alamos National Lab., NM.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 985-986 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

The large preatmospheric size of the Canyon Diablo meteorite, a radius of about 15 m, makes it especially suitable for systematic studies of cosmogenic nuclide production rates of iron objects in a 2 pi geometry. To reconstruct the exposure history of the meteoroid, Heymann et al. investigated several fragments recovered from known geographic locations around the crater for their shock features and cosmogenic nobel gases. They applied the Signer-Nier noble gas production rate model to establish the preatmospheric depth of the specimens in the meteoroid. Cosmic ray exposure ages suggested a multi-episodic irradiation, with 170 or 540 Ma being inferred for most of the samples studied while two anomalous specimens indicated a possible third exposure age at 940 Ma. Be-10 and Cl-36 have been measured in a number of these same samples by accelerator mass spectrometry (AMS), with use being made of the preatmospheric depths determined in Heymann et al. to construct production profiles. The present study extends the cosmogenic radionuclide data to Al-26 and compares the results with both the production rate model of Reedy and Arnold and production rates determined from the cross sections used by the Reedy-Arnold model (for the major nuclear reactions making Al-26) in combination with differential fluxes calculated using the Los Alamos High Energy Transport (LAHET) Code System. Model calculations for Be-10 and Cl-36 have also been obtained.

EXSOLVED KIRSCHSTEINITE IN ANGRITE LEW86010 OLIVINE Abstract Only **c90**

Takashi Mikouchi, Hiroshi Takeda, Hiroshi Mori, Masamichi Miyamoto, and Gordon McKay (National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, TX.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 987-988 (For primary document see N94-16173 03-91)

Avail: CASI HC A01/MF A06

Mineralogy of kirschsteinite exsolution in olivine from Antarctic meteorite LEW86010 has been studied by single crustal X-ray diffraction technique.

The LEW86010 olivine crystals have exsolution lamellae of kirschteinite about 15 microns wide. Determination of crystallographic orientation of exsolved kirschsteinite in an olivine grain has been made. Weak reflections of exsolved kirschsteinite share common crystallographic orientation with the host olivine. The cell dimensions of the exsolved phase (a - 4.87 plus or minus 0.05A, b - 11.14 plus or minus 0.10A, c - 6.36 plus or minus 0.05A) and intensities were in well accord with those of kirschsteinite previously reported. Oriented section perpendicular to the a axis shows exsolution lamellae in two directions parallel to (031) and (031). The lamellae are up to 10 microns in width and spacings between them are usually 50-100 microns. Author (revised)

ANALYSIS OF PYROXENE ABSORPTIONS OBSERVED IN MARTIAN DARK REGIONS Abstract Only
J. S. Miller and R. B. Singer *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 989-990 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

We have investigated the mineralogy of the Martian dark regions by analysis of the pyroxene Fe(2+) absorption band near 1.0 micron in a set of VIS/NIR reflectance spectral images. The data used for these analyses were selected from a larger set, extending from 0.44 to 1.02 microns, obtained during the close 1988 opposition and covering substantially all of Mars south of 40 degrees N. This data set is being used in regional mapping of spectral parameters related to surface mineralogy. Martian dark regions are of interest in reconstructing the geologic history because they contain exposures of unaltered or little-altered basaltic crustal material; mapping differences in composition among dark regions could reveal regional or temporal variation in magmatic activity or mantle source composition. Two types of dark regions are seen, with the pyroxene band present and absent; where present, the inferred composition is in the range pigeonite-augite to very high-Fe, low-Ca pyroxene, with a two-pyroxene mixture possible. REFRACTORY PRECURSOR COMPONENTS IN AN ALLENDE FERROMAGNESIAN CHONDRULE Abstract Only **c90**
Keiji Misawa, Takashi Fujita (Kyoto Univ., Japan.), Masao Kitamura (Kyoto Univ., Japan.), and Noboru Nakamura (Kobe Univ., Japan.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 991-992 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Chemical and petrological studies of chondrules revealed that they were formed through melting of pre-existing solid precursor materials, and that one of the refractory lithophile precursors was a high temperature condensate from the nebular gas and related to Ca, Al-rich inclusions (CAIs). Sheng et al. found relict spinel grains with isotopically fractionated Mg in plagioclase-olivine inclusions from CV chondrites and suggested that the major fractionation processes were common to CAIs and chondrules. We have determined the Mg isotopic compositon of five barred olivine chondrules and one coarse-grained rim from the Allende (CV3) meteorite. A reproducibility of instrumental isotope fractionation is plus or minus 2 per thousand per amu. The precision of the Mg-26/Mg-24 data after normalization for mass fractionation can be as good as 0.5 per thousand (2 sigma(mean)). The Mg analytical results are given and indicate that delta Mg-25/Mg-24 and sigma Mg-26 of the chondrules are normal within errors. Derived from text

IGNEOUS FRACTIONATION AND SUBSOLIDUS EQUILIBRATION OF DIOGENITE METEORITES Abstract Only **c90**
David W. Mittlefehldt *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 993-994 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Diogenites are coarse-grained orthopyroxenite breccias of remarkably uniform major element composition. Most diogenites contain homogeneous pyroxene fragments up to 5 cm across of Wo2En74Fs24 composition. Common minor constituents are chromite, olivine, trolite and metal, while silica, plagioclase, merrillite and diopside are trace phases. Diogenites are generally believed to be cumulates from the eucrite parent body, although their relationship with eucrites remains obscure. It has been suggested that some diogenites are residues after partial melting. I have performed EMPA and INAA for major, minor and trace elements on most diogenites, concentrating on coarse-grained mineral and lithic clasts in order to elucidate their igneous formation and subsequent metamorphic history. Major element compositions of diogenites are decoupled from minor and trace element compositions; the latter record an igneous fractionation sequence that is not preserved in the former. Low equilibration temperatures indicate that major element diffusion continued long after crystallization. Diffusion coefficients for trivalent and tetravalent elements in pyroxene are lower than those of divalent elements. Therefore, major element compositions of diogenites may represent means of unknown portions of a cumulate homogenized by diffusion, while minor and trace elements still yield information on their igneous history. The scale of major element equilibration is unknown, but is likely to be on the order of a few cm. Therefore, the diogenite precursors may have consisted largely of cm-sized, igneously zoned orthopyroxene grains, which were subsequently annealed during slow cooling, obliterating major element zoning but preserving minor and trace incompatible element zoning. Meteor Crater, Arizona provides an opportunity to study, in detail, elemental fractionation processes occurring during impacts through the study of target rocks, meteorite projectile and several types of impact products. We have performed EMPA and INAA on target rocks, two types of impact glass and metallic spherules from Meteor Crater. Using literature data for the well studied Canyon Diablo iron we can show that different siderophite element fractionations affected the impact glasses than affected the metallic spherules. The impact glasses primarily lost Au, while the metallic spherules lost Fe relative to other siderophile elements. Author (revised)

IDENTIFICATION OF NEW METEORITE, MIHONOSEKI (L), FROM BROKEN FRAGMENTS IN JAPAN Abstract Only **c90**
Y. Miura and Y. Noma *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 997-998 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

New meteorite of Mihonoseki fallen in Shimane-ken was identified by fine broken pieces by using an energy-dispersive scanning electron microprobe analyzer. It shows fusion-crust (i.e. Fe-Si melt), meteoritic minerals (kamacite, taenite, troilite, amorphous plagioclase etc.) and chrondrule with clear glassy rim. Mineralogical, and petrological data of several fine grains suggest that broken fragments of Mihonoseki are L3/4 chondritic meteorite which is the first identification in a Japanese fallen meteorite. The prompt identification method of meteorite-fragments will be applied to the next lunar, Martian and asteroid explorations, as well as meteorite falls on the terrestrial surface. Derived from text

THE THICKNESS OF EUCRITIC CRUST IN THE HED PARENT BODY Abstract Only **c46**
M. Miyamoto and H. Takeda *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 999-1000 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Because cumulate eucrites are generally thought to be located at the lower part in eucritic crust on a diogenitic mantle in the HED parent body, the burial depth of cumulate eucrites gives information on the thickness of the eucritic crust. We estimated the burial depth and cooling rate of cumulate eucrites, Serra de Mage and Moore County on the basis of the width of augite lamellae and compositional gradients of Ca in pyroxenes by

numerically solving the diffusion equation. We obtained the burial depth of the eucrites of 7-8 km and cooling rate of 0.00016-0.0002 degrees C/yr.

ZAOYANG CHONDRITE COOLING HISTORY FROM PYROXENE Fe(2+)-Mg INTRACRYSTALLINE ORDERING AND EXOLUTIONS Abstract Only **c90**
G. M. Molin, M. Tribaudino (Turin Univ., Italy.), and E. Brizi (Perugia Univ., Italy.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1001 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The Zaoyang ordinary chondrite fell as a single 14.15-kg mass in Hubey province (China) in October 1984 and was classified as a non-brecciated H5 chondrite, shock facies b. Cooling rate in pyroxenes can be calculated down to about 1000 C by using fine textures and at still lower temperatures (700 to 200 C) by intracrystalline ordering processes. The crystal chemistry of clinopyroxene and orthopyroxene from the matrix of the H5 Zaoyang chondrite has been investigated by X-ray structure refinement and detailed microprobe analysis. By comparison with terrestrial pyroxenes cell and polyhedral volumes in clino- and orthopyroxenes show a low crystallization pressure. Fe(2+) and Mg are rather disordered in M1 and M2 sites of clino- and orthopyroxenes; the closure temperatures of the exchange reaction are 600 and 512 C respectively, which is consistent with a quite fast cooling rate, estimated of the order of one degree per day. The closure temperature for the intercrystalline Ca-Mg exchange reaction for clino- and orthopyroxene showing clinopyroxene lamellae about 10 microns thick. Kinetic evaluations based on the thickness of exolved lamellae give a cooling rate of not more than a few degrees per 10(exp 4) years. The different cooling rates obtained from Fe(2+)-Mg intracrystalline partitioning and exolution lamellae suggest an initial episode of slow cooling at 900 C, followed by faster cooling at temperatures of 600-500 C at low pressure conditions. The most probable scenario of the meteorite history seems that the exolved orthopyroxene entered the parental chondrite body after exolution had taken place at high temperature. Subsequent fast cooling occurred at low temperature after the formation of the body.

RELIEF OF SOME SMALL LANDFORMS ON VENUS Abstract Only
H. J. Moore, J. J. Plaut (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), and T. J. Parker (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1003-1004 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Three sets of radar images have been acquired under different viewing conditions by the Magellan synthetic aperture radar: (1) left-looking with varied incidence angles (cycle 1); (2) right-looking with nearly constant incidence angles (cycle 2); and (3) left-looking with varied incidence angles, most of which were smaller than those in (1) except for those acquired on passes across Maxwell Montes with incidence angles larger than those in (1) (cycle 3). Image displacements in the radar images that are caused by the relief of landforms provide several methods of estimating this relief: (1) monoscopic measurements of foreshortening of landforms that are symmetrical in the plane of the look-direction of the radar (includes radial symmetry); (2) stereoscopic measurements of parallax in same-side image pairs (cycles 1-2 and 3); and (3) measurements of parallax in opposite-side image pairs (cycles 1-2 and/or 2-3). Success in methods 2 and 3 (especially 3) depends on identifying conjugate image points in the two images. Here, we report our preliminary results for five impact craters, seven small volcanic edifices, and two lava flows. The three methods mentioned above lead to the interesting result that Venusian impact craters have depth-diameter ratios like those on Mars rather than those on Earth, but some appear partly filled. Our results for de Lalande and Melba also suggest filling, but there may be other causes for their relatively small depth-diameter ratios. A host of small volcanic edifices have relief that can be crudely estimated using the above methods. Relief/diameter ratios for our cratered cones are about the same as those of Icelandic lava shields; some Venusian cones resemble the Martian shields of Mareotis-Tempe and Ceraunius Fossae, but the Venusian relief diameter ratios are larger. The smallest cratered dome is similar in size and profile to a Martian dome north of Uranius Patera; the smallest cratered cone resembles one in Chryse Planitia. Lava flows on Venus that are thick enough to measure are rare, but we have applied methods 1 and 3 to the huge flow of Ovda Regio and flows of an unusual volcano, Mahuea Tholus.

MARS BRINE FORMATION EXPERIMENT Abstract Only
Jeffrey M. Moore, Mark A. Bullock (Colorado Univ., Boulder.), and Carol R. Stoker *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1005-1006 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The presence of water-soluble cations and anions in the Martian regolith has been the subject of speculation for some time. Viking lander data provided evidence for salt-cemented crusts on the Martian surface. If the crusts observed at the two Viking landing sites are, in fact, cemented by salts, and these crusts are globally widespread, as IRTM-derived thermal inertia studies of the Martian surface seem to suggest, then evaporite deposits, probably at least in part derived from brines, are a major component of the Martian regolith. The composition of liquid brines in the subsurface, which not only may be major agents of physical weathering but may also presently constitute a major deep subsurface liquid reservoir, is currently unconstrained by experimental work. A knowledge of the chemical identity and rate of production of Martian brines is a critical first-order step toward understanding the nature of both these fluids and their precipitated evaporites. Laboratory experiments are being conducted to determine the identity and production rate of water-soluble ions that form in initially pure liquid water in contact with Mars-mixture gases and unaltered Mars-analog minerals.

CATALYTIC CRYSTALLIZATION OF ICES BY SMALL SILICATE SMOKES AT TEMPERATURES LESS THAN 20K Abstract Only **c76**
M. Moore, R. Ferrante, R. Hudson, T. Tanabe, and J. Nuth *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1007-1008 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Samples of methanol and water ices condensed from the vapor onto aluminum substrates at low temperatures (below approximately 80 K) form amorphous ices; annealing at temperatures in excess of 140-155 K is usually required to convert such amorphous samples to crystalline ices. However, we have found that when either methanol or water vapor is deposited on to aluminum substrates that have been coated with a thin (0.1-0.5 mm) layer of amorphous silicate smoke, the ices condense in crystalline form. We believe that crystalline ice forms as the result of energy liberated at the ice/silicate interface perhaps due to weak bonding of the ice at defect sites on the grains and the very high surface to volume ratio and defect density of these smokes. Annealing of amorphous water ice mixed with more volatile components such as methane, carbon monoxide, etc., has been suggested as an efficient way to produce clatherates in the outer solar nebula and thus explain the volatile content of comets and icy satellites of the outer planets. This hypothesis may need to be re-examined if amorphous ice does not form on cold silicate grains.

EFFECTIVE ELASTIC THICKNESS OF THE VENUSIAN LITHOSPHERE WITH LATERAL VISCOSITY VARIATIONS IN THE MANTLE Abstract Only
Louis Moresi *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1009-1010 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Both the Earth and Venus have a convecting mantle at the top of which is a relatively strong, mechanical boundary layer. The surface topography and gravity signals which result from the convection within the viscous mantle are modified by the elastic properties of this lithospheric

boundary layer. In particular the ability of the lithosphere to support loads and transmit stresses from below is a function of the wavelength of the load--the lithosphere is strong to loading at shorter wavelengths. As a consequence it is usual to expect that long wavelength topography cannot be supported by the mechanical strength of the lithosphere and must be compensated--isostatically or dynamically--within the uppermost mantle or the crust. The flexural rigidity of the lithosphere can therefore be determined by estimating the greatest wavelength at which uncompensated surface topography can be supported, usually by measuring the admittance as a function of wavelength. In fact this procedure for determining the elastic thickness relies upon being able to distinguish topography with underlying support from that supported by the brittle lithosphere on the basis of their each having a characteristic value of the admittance. However, in the presence of lateral viscosity variations in the mantle, it is possible for topography to be generated which is NOT compensated by density anomalies in the underlying mantle at the same wavelength. Although this effect is not likely to be important for the Earth, on Venus, where the high surface temperatures would be expected to give a weaker lithosphere, lateral viscosity variations in the mantle can give a misleadingly large apparent elastic thickness for the lithosphere. OPTICAL EFFECTS OF REGOLITH PROCESSES ON S ASTEROIDS AS SIMULATED BY LASER IMPULSE ALTERATION OF ORDINARY CHONDRITE Abstract Only **c90**

L. V. Moroz, A. V. Fisenko, L. F. Semjonova, and C. M. Pieters (Brown Univ., Providence, RI.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1011-1012 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The spectral properties of some powdered chondrites and minerals altered by lsser impulse are studied in order to estimate possible optical effects of regolith processes (micrometeoritic bombardment). Gradual reduction of overall reflectance and spectral contrast, the increase of continuum slope, the increase of spectrally derived olivine/pyroxene ratio and Fs content of orthopyroxene with increasing alteration degree show that regolith processes could affect optical properties of surface material more heavily than has been previously appreciated. Ordinary chondrites (OC's) are known to account for 80 percent of observed meteorite falls, but so far no main belt parent bodies have been identified for these meteorites. S-asteroids resemble OC's spectrally, but are characterized by a steeper red continuum unlike that of OC's and their spectrally derived mineralogies are far outside OC range. Attempts were made to explain the spectral mismatch between OC's and S asteroids by some process, which alters optical properties of uppermost regolith. However, the spectral studies of shocked (black) OC's, gas-rich OC's, melted OC's and synthetic metal-rich regoliths derived from OC's demonstrate that such altered OC materials darken, but do not redden. ALTITUDE PROFILE OF AEROSOLS ON MARS FROM MEASUREMENTS OF ITS THERMAL RADIATION ON LIMB Abstract Only

V. I. Moroz, D. V. Titov, Yu. M. Gektin, M. K. Naraeva, and A. S. Selivanov *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1013-1014 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Measurements of the thermal (range 7 - 13 micrometers) radiation of Mars with the high space resolution (approximately 2 km) were made by the TERMOSKAN experiment of the Phobos mission. Some of the results were published earlier but only the surface radiation was analyzed in detail. However some part of these measurements was made near the limb of the planet. The atmosphere gives an important input here in the planetary thermal radiation. Beyond the limb the atmosphere is the only source. The task of this work is to estimate some characteristics of the atmosphere using brightness profiles of the thermal radiation near the limb. An appropriate model of the temperature profile T(h) is necessary for such an analysis. A set of T(h) models (nominal, maximal and minimal) was defined using various sources including MARSGRAM, Viking-1 lander data, its theoretical considerations and boundary layer models. On the next step the possible input of the atmospheric gaseous emissions (wing of CO2 15 micrometer band) was estimated. It was found that even for the maximal T(h) this input is no more than a few percents of the measured radiation beyond the limb. Consequently the aerosols are responsible for almost all measured emission. The analysis of the observed profile showed that these aerosols have two components: (1) exponential with the scale height about 10 km and (2) some layered structure (two layers with maxima about 23 and 33 km consisted probably of ice). TERRESTRIAL IMPACT MELTS AS ANALOGUES FOR THE HEMATIZATION OF MARTIAN SURFACE MATERIALS Abstract Only **c46**

R. V. Morris, H. V. Lauer, Jr. (Lockheed Engineering and Sciences Co., Houston, TX.), and D. C. Golden *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1015-1016 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Visible and near-IR reflectivity and Mossbauer data were obtained on powders of hydrothermally-altered impact melt sheets from West Clearwater Lake, Manicouagan, and Ries (Polsingen) impact structures. The data support previous interpretations that Martian bright regions spectra can be interpreted by a ferric-bearing phase that has a relatively featureless absorption edge together with some well-crystalline (bulk) hematite to account for the 860 nm hematite band. The data also show that bands at wavelengths longer than 900 nm, which are characteristic of Martian dark regions, occur when both hematite and pyroxene are present. It thus follows that hematization of Mars can be attributed, at least in part, to hydrothermal alterations of impact melt sheets. Impact heating could also form bulk-Hm from nanophase ferric oxides. A HYDROGEN ISOTOPE STUDY OF CO3 TYPE CARBONACEOUS CHONDRITES; COMPARISON WITH TYPE 3 ORDINARY CHONDRITES Abstract Only **c90**

A. D. Morse, J. Newton, and C. T. Pillinger *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1017-1018 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Meteorites of the Ornans type 3 carbonaceous chondrites exhibit a range in degree of equilibration, attributed to differing amounts of thermal metamorphism. These differences have been used to split the CO3 chondrites into petrologic sub-types from 3.0, least equilibrated, to 3.7, being most equilibrated. This is similar to the system of assigning the type 3 ordinary chondrites into petrologic sub-types 3.0 to 3.9 based upon thermoluminescence (TL) and other properties; however, the actual range of thermal metamorphism experienced by CO3 chondrites is much less than that of the type 3 ordinary chondrites. The least equilibrated ordinary chondrites show evidence of aqueous alteration and have high D/H ratios possibly due to a deuterium-rich organic carrier. The aim of this study was to determine whether the CO3 chondrites, which have experienced similar secondary conditions to the type 3 ordinary chondrites, also contain a similar deuterium-rich carrier. To date a total of 5 CO3 meteorites, out of a set of 11 for which carbon and nitrogen isotopic data are available, have been analyzed. Ornans has not been analyzed yet, because it does not appear to fit in with the metamorphic sequence exhibited by the other CO3 chondrites; it also has an extremely high delta-D value of +2150 percent, unusual for such a comparatively equilibrated meteorite (type 3.4). Initial results indicate that the more equilibrated CO3's tend to have lower delta-D values, analogous to the higher petrologic type ordinary chondrites. However this is complicated by the effects of terrestrial weathering and the small data-set. Derived from text

Avail: CASI HC A01/MF A06

We review the current status of the Los Alamos program to develop a high-resolution gamma-ray spectrometer for the Lunar Scout-II mission, which is the second of two Space Exploration Initiative robotic precursor missions to study the Moon. This instrument will measure gamma rays in the energy range of approximately 0.1 - 10 MeV to determine the composition of the lunar surface. The instrument is a high-purity germanium crystal surrounded by an CsI anticoincidence shield and cooled by a split Stirling cycle cryocooler. It will provide the abundance of many elements over the entire lunar surface. Derived from text

THE INFLUENCE OF OCEANS ON MARTIAN VOLCANISM Abstract Only

Peter Mouginis-Mark *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1021-1022 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Geomorphological evidence for episodic oceans on Mars has recently been identified. This idea of large bodies of water on Mars is innovative and controversial compared to the more generally accepted view of a 'dry Mars', but also enables some of the more enigmatic volcanic landforms to be reinterpreted in a self-consistent model. This hypothesis can be used to develop new models for the mode of formation of several volcanic landforms in the W. Tharsis and S.E. Elysium Planitia regions of Mars. Derived from text

HELIUM-3 INVENTORY OF LUNAR SAMPLES: A POTENTIAL FUTURE ENERGY RESOURCE FOR MANKIND? Abstract Only

A. V. Murali and J. L. Jordan *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1023-1024 (For primary document see N94-16173 03-91)
(Contract NAS9-17900)
Avail: CASI HC A01/MF A06

Recent public concern over the safety, cost, and environmental impact of the worldwide fission reactors has focused the attention of scientists and engineers towards perfecting fusion technology because it promises a much more environmentally acceptable 'clean' energy supply. The fusion reaction D-2 + He-3 yields p(14.7 MeV) + He-4(3.6 MeV) has long been recognized as an ideal candidate for producing commercially 'safer and cleaner' fusion power. Naturally occurring He-3 is scarce on earth; however, lunar regolith is a potential ore for He-3 because the high He-3 in solar wind has been implanted in the lunar regolith for more than 4 x 10(exp 9) years, along with other volatile species. The helium abundance in lunar soils is dependent not only on the maturity of soils (I(sub S)/FeO) but also on their mineralogy. The titanium-rich (ilmenite) lunar soils are important repositories for volatiles, which may be released by heating these soils up to approximately 700 C. CASI

THE SPECTRUM OF PHOBOS FROM PHOBOS 2 OBSERVATIONS AT 0.3-2.6 MICRONS: COMPARISON TO PREVIOUS DATA AND METEORITE ANALOGS Abstract Only

Scott Murchie and Stephane Erard (Rome Univ., Italy.) *In its* Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1025-1026 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The surface of Phobos has been proposed to consist of carbonaceous chondrite or optically darkened ordinary chondrite ('black chondrite'). Measurements of Phobos's spectrum are key evidence for testing these hypotheses. Disk-integrated measurements were obtained by the Mariner 9 UV spectrometer, Viking Lander cameras, and groundbased observations. In 1989 disk-resolved measurements of Phobos and Mars were obtained by three instruments on Phobos 2: the KRFM spectrometer, which covered the wavelength range 0.32 - 0.6 microns; the ISM imaging spectrometer, which covered the wavelength range 0.76 - 3.16 microns; and the VSK TV cameras, whose wavelength ranges overlap those of KRFM and ISM. Here we report analysis of the Phobos 2 measurements completed since earlier results were reported. We validated calibration of the Phobos measurements using observations of Mars for reference, and compared them with pre-1989 measurements. We also combined spectra from the three detectors to produce an integrated spectrum of Phobos from 0.3 - 2.6 microns. Phobos 2 results agree well with previous measurements, contrary to some reports. The general shape of the spectrum is consistent with both proposed analogues. However position and depth of the previously unobserved 1 micron absorption are more diagnostic, and indicate the composition of typical surfaces to be more consistent with black chondrite. BRIGHT SOIL UNITS ON MARS DETERMINED FROM ISM IMAGING SPECTROMETER DATA Abstract Only

Scott Murchie and John Mustard (Brown Univ., Providence, RI.) *In its* Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1027-1028 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The lithology of bright Martian soil provides evidence for chemical and physical processes that have modified the planet's surface. Data from the ISM imaging spectrometer, which observed much of the equatorial region at a spatial resolution of approximately 22 km, cover the NIR wavelength range critical to ascertaining the presence and abundance of Fe-containing phases, hydroxylated silicates, and H2O in the bright soil. ISM data previously have revealed spatial variations in depth of the 3.0-microns H2O absorption suggesting differences in water content, a weak absorption at 2.2 microns indicative of metal-OH in phyllosilicate, and variations in the 1-micron Fe absorption indicative of differences in Fe mineralogy. This paper summarizes first results of a systematic investigation of spectral heterogeneity in bright soils observed by ISM. At least seven 'units' with distinctive properties were discriminated. Comparison of their spatial distributions with Viking data shows that they generally correspond with previously recognized morphologic, color, and thermal features. These correspondences and the units' spectral attributes provide evidence for lithologic differences between the soils in different geologic settings. Derived from text

VARIATIONS IN THE Fe MINERALOGY OF BRIGHT MARTIAN SOIL Abstract Only

Scott Murchie, John Mustard (Brown Univ., Providence, RI.), Stephane Erard (Rome Univ., Italy.), Paul Geissler (Arizona Univ., Tucson.), and Robert Singer (Arizona Univ., Tucson.) *In its* Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1029-1030 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Bright regions on Mars are interpreted as 'soil' derived by chemical alteration of crustal rocks, whose main pigmentary component is ferric oxide or oxyhydroxide. The mineralogy and mineralogic variability of ferric iron are important evidence for the evolution of Martian soil: mineralogy of ferric phases is sensitive to chemical conditions in their genetic environments, and the spatial distributions of different ferric phases would record a history of both chemical environments and physical mixing. Reflectance spectroscopic studies provide several types of evidence that discriminate possible pigmentary phases, including the position of a crystal field absorption near 0.9 microns and position and strengths of absorptions in the UV-visible wavelength region. Recent telescopic spectra and laboratory measurements of Mars soil analogs suggest that spectral features of bright soil can be explained based on a single pigmentary phase, hematite (alpha-Fe2O3), occurring in both 'nanophase' and more crystalline forms. Here we report on a systematic investigation of Martian bright regions using ISM imaging spectrometer data, in which we examined spatial variations in the position and shape of the approximately 0.9 microns absorption. We found both local and regional heterogeneities that indicate differences in Fe mineralogy. These results demonstrate that bright soils do not represent a single lithology that has been homogenized by eolian mixing, and suggest that weathering of soils in different geologic settings has followed different physical and chemical pathways. SOLAR NOBLE GASES REVEALED BY CLOSED SYSTEM STEPPED ETCHING OF A METAL SEPARATE FROM FAYETTEVILLE Abstract Only **c25**
Ch. Murer, H. Baur, P. Signer, and R. Wieler *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1031-1032 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Solar He, Ne, and Ar in a Fe-Ni separate from the chondrite Fayetteville are analyzed by closed system stepped oxidation. We report here data of the first 15 steps comprising 55 percent of the total solar gases. He-4/Ar-36 and Ne-20/Ar-36 are quite constant at values about 20 percent below those of present day solar wind (SWC). In this, Fe-Ni differs from lunar ilmenites where He-4/Ar-36 and Ne-20/Ar-36 in the first steps are several times below SWC. Thus, metal retains SW-noble gases even better than ilmenite, almost without element fractionation. Nevertheless, the isotopic composition of SW-He, -Ne, and -Ar in the first steps of the metal sample are identical to those found in a recently irradiated lunar ilmenite, indicating that ilmenites and chondritic metal both contain isotopically unfractionated SW noble gases. A preliminary analysis of a smaller Fayetteville metal separate shows Ne from solar energetic particles (SEP-Ne) with Ne-20/Ne-22 less than or equal to 11.5. Author

EFFECTS OF LEVITATED DUST ON ASTRONOMICAL OBSERVATIONS FROM THE LUNAR SURFACE Abstract Only **c89**
D. L. Murphy and R. R. Vondrak *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1033-1034 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

It is believed that a substantial population of levitated dust is present in the terminator region of the moon. Stray light scattered by this dust layer may contaminate astronomical observations made from the lunar surface using infrared, visible, and ultraviolet light. The evidence for dust levitation stems from: Surveyor vidicon images of horizon glow; anomalous brightness in photographs of the solar corona taken by Apollo astronauts while the spacecraft was just inside the moon's shadow; and observations by Apollo astronauts of streamers just prior to lunar orbital sunrise or just after lunar orbital sunset. It has been proposed that the differential charging of the lunar surface in the terminator region due to photoemission and the consequent strong local electric fields comprise the mechanism responsible for this levitation. Although quantitative data on the levitated lunar dust distribution are meager, it is possible to estimate column densities and sizes. In this paper we summarize the estimates of particulate sizes and number densities of previous authors, and construct a nominal terminator dust distribution, as a function of particulate radius and altitude above the lunar surface. Using the model we estimate the brightness of scattered sunshine for three wavelength bands. For the results in the visible wavelengths, we compare the estimated brightness with the known brightness of selected astronomical objects and discuss the implications for lunar-based astronomy. DUST-DYNAMIC FEEDBACKS IN THE MARTIAN ATMOSPHERE: SURFACE DUST LIFTING Abstract Only
James R. Murphy and James B. Pollack *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1035-1036 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Numerical models have been developed to study surface dust lifting in the Martian atmosphere. The present model is comprised of interactively coupled 3-D dynamical and aerosol transport/microphysical models. The nature of possible feedbacks between surface dust lifting and the amplification/damping of near-surface wind and thermal fields and their implications for additional lifting is investigated. These studies have examined large scale Martian topography for its impact upon the ability of the atmospheric circulation to lift dust from the surface, and the particular component(s) responsible for the lifting (e.g. overturning circulation, thermal tides, baroclinic waves). Analogous experiments in which the lifted dust is radiatively inactive (passive tracer) have been conducted to act as a control against which feedbacks are defined. CASI

NITROGEN AND LIGHT NOBLE GASES IN PARSA ENSTATITE CHONDRITE Abstract Only **c90**
S. V. S. Murty *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1037-1038 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

Solar gases have been recently reported in Parsa, an EH3 chondrite. In an effort to check whether solar gases are uniformly distributed throughout Parsa or they are located in specific phases, we analyzed two additional samples of bulk Parsa and one aubritic nodule for N and noble gases. Nitrogen studies are intended for the understanding of the nitrogen components distribution in E-chondrites. The N-systematics of the nodule are entirely different from the bulk samples. The higher N contents in this nodule, as well as its complex delta(sup 15)N structure, as compared to the normal aubrites, is suggestive that the nodule is not a genuine aubrite. Derived from text

COMPOSITION OF WEAKLY ALTERED MARTIAN CRUST Abstract Only
J. F. Mustard, S. L. Murchie (Lunar and Planetary Inst., Houston, TX.), and S. Erard (Rome Univ., Italy.) *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1039-1040 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

The mineralogic and chemical composition of weakly altered crust remains an unresolved question for Mars. Dark regions hold clues to the composition since they are thought to comprise surface exposures of weakly altered crustal materials. Understanding the in situ composition of relatively pristine crustal rocks in greater detail is important for investigating basic volcanic processes. Also, this will provide additional constraints on the chemical pathways by which pristine rocks are altered to produce the observed ferric iron-bearing assemblages and inferred clay silicate, sulphate, and magnetic oxide phases. Reflectance spectra of dark regions obtained with the ISM instrument are being used to determine the basic mineralogy of weakly altered crust for a variety of regions on Mars. Derived from text

FROM MINERALS TO ROCKS: TOWARD MODELING LITHOLOGIES WITH REMOTE SENSING Abstract Only **c43**
John F. Mustard, Jessica M. Sunshine, Carle M. Pieters, Andrew Hoppin, and Stephan F. Pratt *In* Lunar and Planetary Inst., Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M 1993 p 1041-1042 (For primary document see N94-16173 03-91)
Avail: CASI HC A01/MF A06

High spectral resolution imaging spectroscopy will play an important role in future planetary missions. Sophisticated approaches will be needed to unravel subtle, super-imposed spectral features typically of natural systems, and to maximize the science return of these instruments. Carefully controlled laboratory investigations using homogeneous mineral separates have demonstrated that variations due to solid solution, changes in modal abundances, and the effects of particle size are well understood from a physical basis. In many cases, these variations can be modeled quantitatively using photometric models, mixing approaches, and deconvolution procedures. However, relative to the spectra of individual mineral components, reflectance spectra of rocks and natural surfaces exhibit a reduced spectral contrast. In addition, soils or regolith, which are likely to dominate any natural planetary surface, exhibit spectral properties that have some similarities to the parent materials, but due to weathering and alteration, differences remain that cannot yet be fully recreated in the laboratory or through mixture modeling. A significant challenge is therefore to integrate modeling approaches to derive both lithologic determinations and include the effects of alteration. We are currently conducting laboratory investigations in lithologic modeling to expand upon the basic results of previous analyses with our initial goal to more closely match physical state

of natural systems. The effects of alteration are to be considered separately. Derived from text

CHAIRMANSHIP OF THE NEPTUNE/PLUTO OUTER PLANETS SCIENCE WORKING GROUP Annual Report
S. Alan Stern 1 Nov. 1993 7 p
(Grant NAGw-2914; SwRI Proj. 15-4945)
(NASA-CR-194625; NAS 1.26:194625) Avail: CASI HC A02/MF A01

The Outer Planets Science Working Group (OPSWG) is the NASA Solar System Exploration Division (SSED) scientific steering committee for the Outer Solar System missions. OPSWG consists of 19 members and is chaired by Dr. S. Alan Stern. This proposal summarizes the FY93 activities of OPSWG, describes a set of objectives for OPSWG in FY94, and outlines the SWG's activities for FY95. As chair of OPSWG, Dr. Stern will be responsible for: organizing priorities, setting agendas, conducting meetings of the Outer Planets SWG; reporting the results of OPSWG's work to SSED; supporting those activities relating to OPSWG work, such as briefings to the SSES, COMPLEX, and OSS; supporting the JPL/SAIC Pluto study team; and other tasks requested by SSED. As the Scientific Working Group (SWG) for Jupiter and the planets beyond, OPSWG is the SSED SWG chartered to study and develop mission plans for all missions to the giant planets, Pluto, and other distant objects in the remote outer solar system. In that role, OPSWG is responsible for: defining and prioritizing scientific objectives for missions to these bodies; defining and documenting the scientific goals and rationale behind such missions; defining and prioritizing the datasets to be obtained in these missions; defining and prioritizing measurement objectives for these missions; defining and documenting the scientific rationale for strawman instrument payloads; defining and prioritizing the scientific requirements for orbital tour and flyby encounter trajectories; defining cruise science opportunities plan; providing technical feedback to JPL and SSED on the scientific capabilities of engineering studies for these missions; providing documentation to SSED concerning the scientific goals, objectives, and rationale for the mission; interfacing with other SSED and OSS committees at the request of SSED's Director or those committee chairs; providing input to SSED concerning the structure and content of the Announcement of Opportunity for payload and scientific team selection for such missions; and providing other technical or programmatic inputs concerning outer solar system missions at the request of the Director of SSED. THE CHROMOSPHERE OF VV CEPHEI AND THE DISTRIBUTION OF CIRCUMSTELLAR DUST AROUND RED GIANTS AND SUPERGIANTS Final Report, 1 Aug. 1990 - 21 Jan. 1992
Wendy Hagen Bauer 31 Jan. 1992 5 p
(Grant NAG5-1213)
(NASA-CR-193594; NAS 1.26:193594) Avail: CASI HC A01/MF A01

The work on this project has followed two separate paths of inquiry. The first project was entitled 'the Chromosphere of VV Cephei.' The examination of the archival spectra revealed significant changes in the spectra. Therefore, we obtained additional observing time with IUE to monitor the system during the summer of 1991. Short-term changes continue to be seen in both the overall spectrum and individual line profiles. Work continues on this object. The second project was entitled 'the Distribution of Circumstellar Dust around Red Giants and Supergiants.' A number of cool evolved stars are surrounded by dust shells of sufficient angular size as to appear extended in the IRAS survey data. The aim of this project has been to convolve the predictions of the flux distribution from model dust shells with the IRAS beam profiles in order to reproduce the observed IRAS scans. At the time of the last status report, the cross-scan profiles of the IRAS detectors had just been added to the modeling procedure. For scans in which the star passed near the detector center, there was no significant variation in predicted scan profile for different detectors. Scans in which the detector did not pass over the bright central star had been anticipated to be particularly useful in determining the dust distribution; however, significant differences in the predicted scan profiles were seen for different detector profiles. For this reason, and due to the cross-talk effects discussed in the previous status report, further work on the scans not including a central star has been postponed in favor of further analysis of scans passing over the central star. MULTISPECTRAL OBSERVATIONS OF THE JOVIAN AURORA
[1992] 23 p Original contains color illustrations
(Grant NAGw-1657)
(NASA-CR-193628; NAS 1.26:193628) Avail: CASI HC A03/MF A01; 4 functional color pages

This paper presents and analyzes images of the Jovian aurora gathered by the Hubble Space Telescope Faint Object Camera (FOC) and the ROSAT Position Sensitive Proportional Counter (PSPC) to determine the function of energetic heavy ion precipitation in the inner magnetosphere and electron acceleration in the outer magnetosphere. Hubble data includes hydrogen auroral spectra and reduced images of Jupiter's north and south poles. One important result is that acceleration of electrons may be largely responsible for the discrete auroral emission features seen in the data set. ROSAT PSPC data presented includes a photon energy spectrum. A two line emission model is shown to produce the best fit to the data. The production of these emission lines occurs as a result of recombination lines that are produced from the slowing of the energetic ion beam as it enters the Jupiter upper atmosphere. It is noted that the observed energetic ion precipitation does not contain sufficient power to explain the observed ultraviolet aurora; it is therefore concluded that both electrons and ions play a role in the Jupiter auroral emissions, but that the bulk of the ultraviolet emissions comes from electron processes. PIONEER VENUS DATA ANALYSIS FOR THE RETARDING POTENTIAL ANALYZER Final Technical Report, Aug. 1988 - Sep. 1993
William C. Knudsen 5 Oct. 1993 86 p
(Contract NAS2-12902; RTOP 370-24-11)
(NASA-CR-194673; NAS 1.26:194673) Avail: CASI HC A05/MF A01

This report describes the data analysis and archiving activities, analysis results, and instrument performance of the orbiter retarding potential analyzer (ORPA) flown on the Pioneer Venus Orbiter spacecraft during the period, Aug. 1, 1988 to Sept. 30, 1993. During this period, the periapsis altitude of the Orbiter spacecraft descended slowly from 1900 km altitude, at which altitude the spacecraft was outside the Venus ionosphere, to approximately 130 km altitude in Oct. 1992 at which time communication with the spacecraft ceased as a result of entry of the spacecraft into the Venus atmosphere. The quantity of ORPA data returned during this reporting period was greatly reduced over that recovered in the previous years of the mission because of the reduced power capability of the spacecraft, loss of half of the onboard data storage, and partial failure of the ORPA. Despite the reduction in available data, especially ionospheric data, important scientific discoveries resulted from this extended period of the Pioneer Venus mission. The most significant discovery was that of a strong solar cycle change in the size of the dayside ionosphere and the resulting shutoff of flow of dayside ions into the nightside hemisphere. The large, topside O+ F2 ionospheric layer observed during the first three years of the Pioneer Venus mission, a period of solar cycle maximum activity, is absent during the solar cycle minimum activity period. WORKSHOP ON EARLY MARS: HOW WARM AND HOW WET, PART 2?
S. Squyres, ed. and J. Kasting, ed. 1993 14 p Workshop held in Breckenridge, CO, 26-28 Jul. 1993
(Contract NASw-4574)
(NASA-CR-193503; NAS 1.26:193503; LPI-TR-93-03-Pt-2) Avail: CASI HC A03/MF A01

In 1992 the MSATT program conducted a workshop on modeling of the Martian climate. At that workshop it became clear that a serious problem had arisen concerning the early climate of Mars. Based on the evidence for smallscale fluvial activity, the view had been widely held that early in its history Mars had a climate that was much warmer and wetter than today's. However, most plausible recent climate models have fallen far short of the warm temperatures often inferred from the geologic evidence. Moreover, recent geophysical work has suggested that early geothermal warming may also have played a significant role in allowing fluvial activity. In order to address the issue of just how warm and how wet early Mars was, a workshop was convened in July of 1993, in Breckenridge, Colorado. The results of the workshop are reported here. Author

GUIDE TO MAGELLAN IMAGE INTERPRETATION
John P. Ford, Jeffrey J. Plaut, Catherine M. Weitz, Tom G. Farr, David A. Senske, Ellen R. Stofan, Gregory Michaels, Timothy J. Parker, and D. Fulton, ed. 1 Nov. 1993 150 p Original contains color illustrations
(NASA-CR-194340; JPL-Publ-93-24; NAS 1.26:194340) Avail: CASI HC A07/MF A02; 9 functional color pages

An overview of Magellan Mission requirements, radar system characteristics, and methods of data collection is followed by a description of the image data, mosaic formats, areal coverage, resolution, and pixel DN-to-dB conversion. The availability and sources of image data are outlined. Applications of the altimeter data to estimate relief, Fresnel reflectivity, and surface slope, and the radiometer data to derive microwave emissivity are summarized and illustrated in conjunction with corresponding SAR image data. Same-side and opposite-side stereo images provide examples of parallax differences from which to measure relief with a lateral resolution many times greater than that of the altimeter. Basic radar interactions with geologic surfaces are discussed with respect to radar-imaging geometry, surface roughness, backscatter modeling, and dielectric constant. Techniques are described for interpreting the geomorphology and surface properties of surficial features, impact craters, tectonically deformed terrain, and volcanic landforms. The morphologic characteristics that distinguish impact craters from volcanic craters are defined. Criteria for discriminating extensional and compressional origins of tectonic features are discussed. Volcanic edifices, constructs, and lava channels are readily identified from their radar outlines in images. Geologic map units are identified on the basis of surface texture, image brightness, pattern, and morphology. Superposition, cross-cutting relations, and areal distribution of the units serve to elucidate the geologic history. Author (revised)

In observations with the NRAO 12m telescope at Kitt Peak, Arizona, Irvine, a new interstellar radical, CH2N, has been detected. This identification is important for the study of hydrogenation processes in the interstellar medium. In particular, although the abundance of hydrogen is some four orders of magnitude higher than that of other reactive elements in this environment, many organic molecules in quiescent clouds are very unsaturated. This is a consequence of activation barriers which cannot be overcome at the temperatures of cold clouds, even when such reactions are energetically allowed. The hydrogenation series based on the cyanide radical (HnCN) has had four members previously detected in the interstellar medium: CN (n equals O), HCN (n equals I), CH2CN (n equals 3), and CH3NH2 (n equals 5). The recent determination of the rotational spectrum of the CH2N radical through microwave spectroscopy in Japan has made possible a search for this species. In addition to its potential importance for interstellar chemistry, the CH2N radical has been proposed as a reaction intermediate for HCN production in the atmosphere of Jupiter, and as a possible species in the expanding envelopes of oxygen--rich evolved stars. We detected CH2N in the cold cloud TMC--1 where the abundance seems to be some three orders of magnitude lower than that of HCN. A tentative detection was made in the Galactic Center molecular cloud Sgr B2. To our knowledge, there are no predicted abundances of CH2N from models of interstellar chemistry. Derived from text

A COMPARISON OF SOLAR WIND PARAMETERS MEASURED BY IMP 8, VOYAGER 1 AND VOYAGER 2 M.S. Thesis
Stephen J. Simmerer 7 May 1993 138 p
(AD-A266728) Avail: CASI HC A07/MF A02

This thesis analyzes measurements of four solar wind parameters (radial velocity, density, ram pressure, and flux density) as observed by three spacecraft: IMP 8 (Interplanetary Monitoring Platform 8, also called Explorer 50), Voyager 1, and Voyager 2. First, a brief discussion of the evolution of the solar wind within the solar system is presented in order to establish a basis for understanding observed trends in spacecraft data. Then following is an explanation and comparison of the data gathering instruments and collection methods of IMP 8 and the Voyager spacecraft including a discussion of the data analysis. Next, solar wind parameters are compared

over four averaging periods: 25/27 days, representing the period of one solar rotation as seen by the Voyagers/IMP 8; 50/54 days, to coincide with two solar rotations; 100 days and 200 days, approximating four and eight solar rotations, respectively. Similarities and differences between spacecraft observations are discussed. DTIC

(AD-A267045; AFOSR-93-0546TR) Avail: CASI HC A01

The goal of this research program is development of a method for obtaining daily, radiometrically accurate, solar spectral irradiance data at extreme-ultraviolet (EUV) wavelengths. In-orbit radiometric instrumentation recalibration is a fundamental requirement for such measurements. It was proposed to investigate, design, and test smaller and less massive, low power, in-space version of a 'standard' EUV radiance source, which was developed for laboratory use and to assess the merits of innovative combinations of rare-gas ionization cells and thin film filters to make absolute measurements of EUV radiation over a number of wavelength bands. THE SOLAR FLARE MYTH IN SOLAR-TERRESTRIAL PHYSICS
J. T. Gosling 1993 15 p Presented at the AGU Monograph/Solar System Plasma Physics Meeting on Resolution of Processes in Space and Time, Yosemite, CA, Feb. 1993
(Contract W-7405-eng-36)
(DE93-016487; LA-UR-93-2371; CONF-9302115-4) Avail: CASI HC A03/MF A01

Early observations of associations between solar flares and large non-recurrent geomagnetic storms, large 'solar' energetic particle events, and transient shock wave disturbances in the solar wind led to a paradigm of cause and effect that gave flares a central position in the chain of events leading from solar activity to major transient disturbances in the near-earth space environment. However, research in the last two decades shows that this emphasis on flares is misplaced. In this paper the author outlines briefly the rationale for a different paradigm of cause and effect in solar-terrestrial physics that removes solar flares from their central position as the 'cause' of major disturbances in the near-earth space environment. Instead, this central role of 'cause' is played by events now known as coronal mass ejections, or CME's. DOE

SOLAR VECTOR MAGNETIC FIELD RESEARCH Final Report, 1 Dec. 1989 - 31 Mar. 1993
David M. Rust 31 Mar. 1993 18 p
(Grant AF-AFOSR-0102-90)
(AD-A267367; AFOSR-93-0558TR) Avail: CASI HC A03/MF A01

The objective of the project was to measure the magnetic fields in solar active regions, develop methods for predicting solar flares on the basis of the measurements, and improve the instrumentation for solar magnetic field measurements. In cooperation with the staff at the Solar Branch of the USAF Phillips Laboratory, field measurements were made almost daily during the grant period. The principal result of analyses carried out so far is that so-called sheared magnetic fields are neither necessary nor sufficient for solar flaring. The crucial element seems to be emerging magnetic flux and local development of shear in the hour before flare onset. A need for greatly improved instrumentation was identified. A new vector magnetograph was designed for operation above the image-degrading layers of the atmosphere. Fourteen technical publications and presentations appeared under grant sponsorship. DTIC

We have performed an extensive study of solar flare energy buildup and release, concentrating in two aspects: (1) relationship with 3D field topology and measured electric currents; and (2) flare onset characteristics as determined from combined x ray and ultraviolet observations. We extended our previous studies on the characteristic topology of flaring regions, by following the evolution of an active region over three consecutive days. From comparison with flare observations in x rays and h alpha, we found further support for the hypothesis that flares were triggered by taking place at the separators (3D generalization of and x-type neutral point). Furthermore, we found that emerging in flux at a site within the active regions where no (or little) activity was previously observed, caused the appearance of a secondary separator and thereon continuous triggering of activity at such site. Our topology arguments were then applied to a study of sympathetic activity between two regions within an active complex. Here again we found that interacting field structures along separators and separatrices, which act as pathways for recurrent flaring to spread between the regions, could be used to understand how activity spread to potentially explosive sites with the complex. We also finished our study of flare onset characteristics as determined from combined x ray and ultraviolet observations. Using a quasi-static modeling approach, we find that this phase is characterized by a relatively low level of energy release, 10 exp 26-27 erg/s, which is sufficient to produce 'gentle' evaporation, a shift in the location of the transition zone as compared to pre-flare conditions, and an increase in the temperature and density of coronal loops. All these changes have profound implications on the observed signatures of impulsive phase phenomena, which had been neglected in the past. As a follow-up of this investigation, we now plan to apply our results to the interpretation of high-sensitivity spectroscopic and hard x-ray data currently being gathered by the Yohkoh and Compton Gamma Ray Observatory satellites. ATMOSPHERIC IONIZATION BY SOLAR PARTICLES DETECTED BY NITRATE MEASUREMENT IN ANTARCTIC SNOW Annual Technical Report, 1 Jun. 1992 - 31 May 1993
G. Dreschhoff, T. P. Armstrong, T. Cravens, and F. Vitt 30 Jun. 1993 121 p
(Contract F49620-92-J-0235)
(AD-A267583; AFOSR-93-0556TR) Avail: CASI HC A06/MF A02

Nitrates are observed in polar snow, firn, and ice in variable amounts and concentrations. Hundred-year or longer time series of nitrate observations can be obtained from ice cores. It is important to identify possible and probable sources of nitrates and mechanisms by which surface deposition and incorporation into ice occurs. Several important sources of nitrate are solar protons and auroral electrons producing ionization in the D-region. Chemical reactions energized by this ionization produce nitrates. Transport mechanisms can move nitrates from the stratosphere into the troposphere where it becomes incorporated into precipitation. From the amounts of nitrates deposited in polar snow over long times it may be possible to determine atmospheric characteristics of importance to climate and global change studies. The specific goal of this study is to evaluate carefully and completely the atmospheric nitrates produced by solar flare protons and auroral electrons and to estimate the amounts deposited in snow. MAGNETIC EFFECTS IN VENUS/SOLAR WIND INTERACTION Final Report

Richard S. Steinolfson 31 Jul. 1993 5 p
(Grant NAG2-692; SwRI Proj. 15-4170)
(NASA-CR-194666; NAS 1.26:194666) Avail: CASI HC A01/MF A01

The overall objective of this research program is to better understand the interaction of a magnetized solar wind with the Venus atmosphere through the use of numerical solutions of the time-dependent, 2-D and 3-D magnetohydrodynamic (MHD) equations. Due to the more modest CPU requirements for the 2-D simulations, they were used for studies in which useful information not dependent on the third dimension could be obtained. The 2-D simulations served several purposes in addition to providing useful physical insight. They were used to determine the numerical parameters required in the 3-D studies, such as the grid spacing required to resolve particular features, and the damping that must be included to remove high-frequency oscillations. Among the specific studies performed with support from this grant that are discussed in this report are the following: comparison with other available models for purposes of testing the code and obtaining a baseline with which to evaluate the effects of additional physical processes, effects of a finite planet conductivity, bow shock standoff distance, and formation of the magnetic barrier and slippage of the magnetic field around the planet. A brief description of the methodology is presented before discussing the results. Author (revised)

KINETIC PLASMA PROCESSES OCCURRING IN THE OUTER PLASMASPHERE Final Progress Report, Nov. 1991 - Apr. 1992
Gordon R. Wilson 6 May 1992 4 p
(Grant NAG5-1555)
(NASA-CR-193452; NAS 1.26:193452) Avail: CASI HC A01/MF A01

One area of data analysis work that was begun under this contract is the fitting of the perpendicular velocity distributions of equatorially trapped ions with a Kappa function. This type of characterization of the trapped ions will be very useful for comparison with velocity distributions produced by the model. A second area of data analysis is to study data from consecutive passes when DE 1's apogee was near the magnetic equator and the spacecraft was often skimming along nearly the same L shell. In 1982 three such periods occurred in May, June, and July. For these consecutive events we have Kp histories, density measurements from a number of sources (Whistler data, DE SFR, ISEE SFR) and consecutive samples of ion pitch angle distributions along field lines. It is clear from this data how the pitch angle distributions evolve during a flux tube refilling event. Our modeling of the flow of plasma along closed field lines is following two basic tracks. The first is a study of the basic refilling process without the effect of wave-particle heating near the equator or the effect of large or abrupt field-aligned electric potential drops. This model includes the effects of Coulomb self-collisions and collisions with the O+ ions in the topside ionosphere. The second track is a study of the effects of wave produced pitch-angle scattering and perpendicular heating occurring near the magnetic equator, in connection with the development of large potential drops that result from electron heating and the development of density gradients. X RAY EMISSION FROM WOLF-RAYET STARS WITH RECURRENT DUST FORMATION Final Report, 2 Nov. 1992 - 1 Nov. 1993
Gayle L. Rawley 29 Oct. 1993 7 p
(NASA Order S-93065-E)
(NASA-CR-194567; NAS 1.26:194567; R93-213) Avail: CASI HC A02/MF A01

We were granted a ROSAT observation of the Wolf-Rayet star WR 137 (equals HD 192641) to test a proposed mechanism for producing the infrared variability reported by Williams et al. (1987). These studies showed one clear infrared outburst preceded by what may be the dimming of a previous outburst. The recurrent dust formation model was put forward by Williams et al. (1990) to account for similar variability seen in WR 140, which varies in both the infrared and X-ray bands. The detected X-ray flux from WR 140 was observed to decrease from its normally high (for Wolf-Rayet stars) level as the infrared flux increased. Observation of two apparently-periodic infrared outbursts led to the hypothesis that WR 140 had an O star companion in an eccentric orbit, and that the increase in infrared flux came from a dust formation episode triggered by the compression of the O star and Wolf-Rayet star winds. The absorption of the X-rays by the increased material explained the decrease in flux at those wavelengths. If the infrared variability in WR 137 were caused by a similar interaction of the Wolf-Rayet star with a companion, we might expect that WR 137 would show corresponding X-ray variability and an X-ray luminosity somewhat higher than typical WC stars, as well as a phase-dependent non-thermal X-ray spectrum. Our goals in this study were to obtain luminosity estimates from our counting rates for comparison with previous observations of WR 137 and other WC class stars, especially WR 140; to compare the luminosity with the IR lightcurve; and to characterize the spectral shape of the X-ray emission, including the column density. The dose incurred in an anisotropic environment depends on the orientation of the astronaut's body relative to the direction of the radiation field. The fluctuations in exposure of specific organs due to astronaut orientation are found to be a factor of 2 or more in a typical space habitation module and typical space radiations. An approximation function is found that overestimates astronaut exposure in most cases studied and is recommended as a shield design guide for future space missions. Derived from text

Atmospheric nu(sub mu) and nu(sub e) are created in cosmic ray interactions in the atmosphere and can be detected in underground detectors. The Kamiokande and IMB water Cerenkov detectors have found fewer nu(sub mu) interactions (relative to nu(sub e)) than are expected. Results are usually expressed by the ratio: R is equivalent (nu(sub mu)/nu(sub mu)) measured/(nu(sub mu)/nu(sub e)) predicted with R found to be less than 1. The Soudan 2 detector is an iron calorimeter, which has different systematic effects than the water Cerenkov counters. Results from the Frejus and NUSEX calorimeters do not suggest a deficit of nu(sub mu)'s in iron implying that perhaps there is a systematic effect in Cerenkov detectors or some unexpected nuclear effect. Here we report on a preliminary analysis of 0.5 kton-year of data in Soudan 2. We are presently analyzing our second 0.5 kt-year of data, and will present new results at the meeting. DOE

SHIELDING FROM SPACE RADIATIONS Annual Progress Report, 1 Dec. 1992 - 1 Jun. 1993
C. Ken Chang, Forooz F. Badavi, and Ram K. Tripathi 1 Dec. 1993 39 p
(Grant NAG1-1286)
(NASA-CR-194664; NAS 1.26:194664) Avail: CASI HC A03/MF A01

This Progress Report covering the period of 1 June 1993 to 1 Dec. 1993 presents the development of an analytical solution to the heavy ion transport equation in terms of a one-layer Green's function formalism. The mathematical developments are recasted into an efficient computer code for space applications. The efficiency of this algorithm is accomplished by a nonperturbative technique of extending the Green's function over the solution domain. The code may also be applied to accelerator boundary conditions to allow code validation in laboratory experiments. Results from the isotopic version of the code with 80 isotopes present for a single layer target material, for the case of an Iron beam projectile at 600 MeV/nucleon in water is presented. CALCULATIONS OF COSMIC-RAY HELIUM TRANSPORT IN SHIELDING MATERIALS
Francis A. Cucinotta Nov. 1993 33 p
(RTOP 199-45-16-11)
(NASA-TP-3354; L-17225; NAS 1.60:3354) Avail: CASI HC A03/MF A01

The transport of galactic cosmic-ray helium nuclei and their secondaries through bulk shielding is considered using the straight-ahead approximation to the Boltzmann equation. A data base for nuclear interaction cross sections and secondary particle energy spectra for high-energy light-ion breakup is presented. The importance of the light ions H-2, H-3, and He-3 for cosmic-ray risk estimation is discussed, and the estimates of the fractional contribution to the neutron flux from helium interactions compared with other particle interactions are presented using a 1977 solar minimum cosmic-ray spectrum. In this report, our research is described through abstracts of journal articles, technical reports, and presentations organized into sections following the five major operating units in the division: Mathematical Sciences, Intelligent Systems, Nuclear Data and Measurement Analysis, Nuclear Analysis and Shielding, and the Engineering Physics Information Centers. Each section begins with an introduction highlighting honors, awards, and significant research accomplishments in that unit during the reporting period. DOE

THE DEFINITION OF A SCIENTIFIC POLICY: ESRO'S SATELLITE PROGRAMME IN 1969-1973
Arturo Russo Mar. 1993 57 p
(ESA-HSR-6) Avail: CASI HC A04/MF A01

The development of the European Space Research Organization's (ESRO's) scientific satellite program in the period 1969-1973 is analyzed. These four years were the most important in the history of European cooperation in space. The paper is organized in three main parts. In the first part, the main features of the two satellite projects approved by the ESRO council in 1969, namely COS-B and GEOS, are reviewed. In the second part, the discussions within the European space science community which led to the important policy statement issued by ESRO's Launching Program Advisory Committee (LPAC) in early 1970 are analyzed. In the third part, the important 'Package Deal' agreed on by the ESRO Council in December 1971 which formally established application satellite programs is reported and the choice of ISEE-2 and Exosat, the coherent conclusion of four years of scientific discussions and feasibility studies, is discussed. EUROPE IN SPACE: EDOARDO AMALDI AND THE INCEPTION OF ESRO
Michelangelo DeMaria (La Sapienza Univ., Rome, Italy.) Mar. 1993 38 p
(ESA-HSR-5) Avail: CASI HC A03/MF A01

This European Space Agency (ESA) History Study Report discusses Edoardo Amaldi and the inception of the European Space Research Organization. Topics covered include: Amaldi's dream of a Euroluna before 1965; Franco-Italian alliance and Auger's Comite des Recherches Spatiales as a model for Europe; first public discussions of Amaldi's project: the British enter the field; and Amaldi's role in the development of a national space program in Italy and his lost battle against the European Space Vehicle Launcher Development Organization (ELDO). EUROPE INTO SPACE: THE AUGER YEARS (1959-1967)
John Krige May 1993 76 p
(ESA-HSR-8) Avail: CASI HC A05/MF A01

This is the first of a series of working papers dealing with an overview of the history of ESRO, ELDO and ESA. As such it represents a synthesis of hundreds, even thousands of pages of source material. To reduce the volume of material in this way, the historian has to make two related intellectual choices. The first concerns what to include (and what to leave out), the second the level at which an issue is to be handled. Both of these choices are difficult and negotiable, in the sense that disagreements are inevitable both between historian and those who lived this history, and between the historian and his or her professional colleagues. The topics I have chosen to concentrate on in this rich and difficult start to Europe's space effort are identified in the table of contents above. As source material I have drawn on previously published, more detailed, work by myself and my colleagues in the ESA History Team, notably results which have already appeared in this series of working papers. It has been supplemented by original documents, particularly those which arrived at the level of the ESRO Council, as well as by articles in the ESRO and the ESRO/ELDO Bulletins. References, as well as material in the notes, have been restricted to the minimum so as not to impede the narrative flow. The series of overviews, of which this is the first, has two main purposes. Firstly, it is intended to provide the general intellectual framework for the detailed two-volume history of the European Space Agency which the Team is to produce. Secondly, parts are to serve for a shorter volume to be published in 1994 to coincide with ESRO's thirtieth birthday. Derived from text

[RESOURCES AND ACTIVITIES OF THE EUROPEAN SPACE AGENCY] Annual Report, 1992
N. Longdon and T. D. Guyenne May 1993 116 p Original contains color illustrations
Copyright Avail: CASI HC A06/MF A02

The European Space Agency (ESA) Annual Report for 1992 is presented. An explanation of major aspects of the work that affects all Member States is reported. This work includes scientific projects, scientific research, Earth observation, telecommunications, space transportation, Colombus/Space Station, microgravity, technology, operations, international cooperation, and public relations. The recent evolution of ESA contractual methods that have had to be adapted to the changing industrial pattern of Europe is explained. The agency's budget, industrial policy, and contracts are described. CASI

THE MEGASCIENCE FORUM Progress Report, 15 Jun. 1992 - 14 Jun. 1993
M. W. Oborne May 1993 6 p
(Contract DE-FG02-92ER-35166)
(DE93-014445; DOE/ER-35166/1) Avail: CASI HC A02/MF A01

This report gives an account of the activities of the OECD Megascience Forum following its creation in June 1992, in particular the reviews of two areas of megascience: Astronomy and deep drilling (both deep sea and

continental). It presents the main policy conclusions reached by the Megascience Forum on these areas. It also gives an indication of ongoing and future work. With regard to ongoing and future work, the Forum will review at its next meeting, in July 1993, the area of global change research, and for this purpose an expert meeting was held in late Mar. 1993 in Cambridge, Mass. (USA). Areas to be reviewed later in 1993 include oceanography, and neutron sources and synchrotron radiation sources as multipurpose facilities for the study of condensed matter, as well as for other applications such as element transmutation. The Megascience Forum will also undertake to discuss generic science and technology policy issues related to the development and management of megascience, starting with a discussion, at its next meeting, of national decision-making structure and processes. ONRASIA SCIENTIFIC INFORMATION BULLETIN, VOLUME 18, NUMBER 2 Quarterly Report, Apr. - Jun. 1993

Jun. 1993 176 p

(AD-A267798) Avail: CASI HC A09/MF A02

This is a quarterly publication presenting articles covering recent developments in Far Eastern (particularly Japanese) scientific research. It is hoped that these reports (which do not constitute part of the scientific literature) will prove to be of value to scientists by providing items of interest well in advance of the usual scientific publications. The articles are written primarily by members of the staff of ONRASIA, with certain reports also being contributed by visiting stateside scientists. Occasionally, a regional scientist will be invited to submit an article covering his own work, considered to be of special interest. This publication is approved for official dissemination of technical and scientific information of interest to the Defense research community and the scientific community at large. DTIC

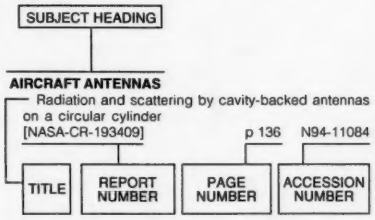
Typical Subject Index Listing



The subject heading is a key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension is added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The page number helps you locate the citation in the abstract section. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus*.

Analysis of pyroxene absorptions observed in Martian dark regions p 1292 N94-16411
Bright soil units on Mars determined from ISM imaging spectrometer data p 1295 N94-16430
From minerals to rocks: Toward modeling lithologies with remote sensing p 1086 N94-16437
Mapping the mineralogy and lithology of Canyonlands, Utah with imaging spectrometer data and the multiple spectral feature mapping algorithm p 1066 N94-16670
The Spectral Image Processing System (SIPS): Software for integrated analysis of AVIRIS data p 1067 N94-16674
AVIRIS study of Death Valley evaporite deposits using least-squares band-fitting methods p 1067 N94-16676
Separation of cirrus cloud from clear surface from AVIRIS data using the 1.38 micron water vapor band p 1072 N94-16699
AVIRIS as a tool for carbonatite exploration: Comparison of SPAM and Mbandmap data analysis methods p 1073 N94-16703
Discussion of band selection and methodologies for the estimation of precipitable water vapour from AVIRIS data p 1074 N94-16707
Convergence of the multiple scattering expansion in XAFS and XANES
[DE93-011001] p 948 N94-16772
Complex QSO absorbers: High-redshift clusters of galaxies?
[NASA-CR-194617] p 1237 N94-16833

ABSORPTION SPECTROSCOPY
A high flux radical beam diamond growth
[AD-A266754] p 1207 N94-15955
In situ studies of passive film chemistry using x ray absorption spectroscopy
[DE93-014023] p 947 N94-16011
Method and apparatus for performing scanning tunneling optical absorption spectroscopy
[AD-D015796] p 948 N94-16539
Characterization of nanoscale oxide and oxyhydroxide powders using EXAFS spectroscopy
[DE93-015683] p 940 N94-17235

ABSORPTIVITY
Characterization of InTISb grown by low pressure metalorganic chemical vapor deposition on GaAs substrate
[AD-A266878] p 1206 N94-14922
Modeling the reflectance of CO2 frost with new optical constants: Application to Martian south polar cap spectra p 1256 N94-16217
Near-surface temperature gradients and their effects on thermal-infrared emission spectra of particulate planetary surfaces p 1260 N94-16236
Theoretical studies of nonlinear optical properties of conjugated polymers
[AD-A267390] p 1193 N94-17024
Resist performance in soft x ray projection lithography
[DE93-016490] p 1036 N94-17647

ABSTRACTS
Annual historical report, calendar year 1992
[AD-A267050] p 1121 N94-15663
AFOSR technical report summaries, January - March 1993
[AD-A267187] p 1230 N94-15850
Proceedings of the Second Workshop on Microgravity Experimentation
[DSS-NR15-43-1990] p 977 N94-16071
DLTS and dynamic transconductance analysis of deep-submicron fully-depleted SOI MOSFET's
[AD-A267291] p 1214 N94-17243
Abstracts of manuscripts submitted in 1992 for publication
[AD-A267963] p 1113 N94-17383

ABUNDANCE
Evolutionary implications of a steady-state water abundance on Venus p 1254 N94-16206
Do SiC grains in Orgueil differ from those in Murchison? p 1242 N94-16260
Carbon abundances, major element chemistry, and mineralogy of hydrated interplanetary dust particles p 1243 N94-16309
Isotopic signatures and distribution of nitrogen and trapped and radiogenic xenon in the Acapulco and FRO90011 meteorites p 1243 N94-16317
A search for noble-gas evidence for presolar oxide grains p 954 N94-16353
Abundance recovery error analysis using simulated AVIRIS data p 1074 N94-16708

AC GENERATORS
Circle diagram approach for self excited induction generators
[DE93-010031] p 1010 N94-15971

ACCELERATED LIFE TESTS
Analytical and experimental investigation of the feasibility of accelerated lifetime testing of materials exposed to an atomic oxygen beam
[NASA-CR-193851] p 946 N94-15766

ACCELERATION (PHYSICS)
A simplistic look at limit stresses from random loading
[NASA-TM-108427] p 1058 N94-15710

ACCELERATION TOLERANCE
Cumulative effect of repeated brief cerebral ischemia
[AD-A267155] p 1121 N94-15736

ACCELEROMETERS
Analysis of the accuracy of strapdown inertial surveying systems
[SER-C-391] p 1081 N94-15156
A feasibility study of a microgravity enhancement system for Space Station Freedom
[NASA-CR-191550] p 886 N94-15864
KC-135 acceleration monitoring and data acquisition system p 868 N94-16090
Precise measurement and utilization of acceleration data p 923 N94-16100

ACCEPTABILITY
Environment tests for mini satellites p 896 N94-17189

ACCEPTOR MATERIALS
Photodegradation of polyimides. V1: Effect of donor-acceptor groups on the photooxidative stability of polyimides and model compounds
[AD-A267319] p 970 N94-16947

ACCIDENT INVESTIGATION
The fragmentation of the Nimbus 6 rocket body
[NASA-CR-191645] p 926 N94-16504

ACCIDENT PREVENTION
The 1971 highlights — NASA programs and research
[NASA-TM-109629] p 1302 N94-15417
OSHA bloodborne pathogens standards exposure control plan p 1127 N94-16645

ACCOUNTING
The ESA Tele-Invoicing System (ETIS)
[ESA-INT-6] p 1150 N94-16591

ACCRETION DISKS
Gas-grain energy transfer in solar nebula shock waves: Implications for the origin of chondrules p 1262 N94-16251

ACCURACY
New perspectives for high accuracy SLR with second generation geodesic satellites p 916 N94-15585
Improvement of SLR accuracy, a possible new step p 917 N94-15588
On the accuracy of ERS-1 orbit predictions p 874 N94-15589
Sub-cm ranging and other improvements in Graz p 919 N94-15603
Temperature and pressure effects on capacitance probe cryogenic liquid level measurement accuracy
[NASA-CR-190763] p 1034 N94-16521

ACETATES
Cyanoresin, cyanoresin/cellulose triacetate blends for thin film, dielectric capacitors
[NASA-CASE-NPO-18913-1-CU] p 966 N94-15930
Cellulose triacetate, thin film dielectric capacitor
[NASA-CASE-NPO-18935-1-CU] p 1010 N94-15952

ACETONE
Aberration correction of unstable resonators
[NASA-CASE-NPO-18791-1-CU] p 1034 N94-15987

ACETYLATION
Bioorganic models for protein ion channels
[AD-A266365] p 1117 N94-16441

ACETYLENE
Modeling study to evaluate the ionic mechanism of soot formation in flames
[AD-A266242] p 950 N94-16930

ACHONDRITES
Petrologic constraints on the surface processes on asteroid 4 Vesta and on excavation depths of diogenite fragments p 1241 N94-16208
Potassium isotope cosmochemistry, volatile depletion and the origin of the Earth p 953 N94-16259
Angrite LEW87051: Are the olivines pheno's or xeno's? A continuing story p 1103 N94-16285
Partial melting of ordinary chondrites: Lost City (H) and St. Severin (LL) p 1243 N94-16286
Exsolved kirschsteinite in angrite LEW86010 olivine p 1245 N94-16410
Igneous fractionation and subsolidus equilibration of diogenite meteorites p 1245 N94-16413

ACID RAIN
What's killing the trees? --- causes for forest decline
[NASA-TM-109621] p 1094 N94-15350

ACIDITY
Intramolecular versus intermolecular condensation rates in the acidic polymerization of octaethoxytrisiloxane
[AD-A266982] p 963 N94-15490

ACOUSTIC ATTENUATION
Interpenetrating polymer network acoustic damping material
[AD-D015889] p 969 N94-16916
Cortical adaptive filtering in bioacoustic signal classification
[AD-A266229] p 1177 N94-16939

ACOUSTIC EMISSION
Studies of aural acoustic emmissions with the use of an original apparatus and investigative methodology
[IFTR-20/1992] p 1177 N94-16650

ACOUSTIC EXCITATION
Sound radiation from infinite laminated composite shell with periodic rib stiffening
[DRA/TM(USGR)92326] p 933 N94-15699

ACOUSTIC FATIGUE
Vibro-acoustic analysis of an aircraft maintenance dock
[AD-A266778] p 871 N94-14908

ACOUSTIC MEASUREMENT
Vibro-acoustic analysis of an aircraft maintenance dock
[AD-A266778] p 871 N94-14908
Free-field sensitivity calibration of laboratory standard microphones by the reciprocity technique: Measurements for the 1991 EEC intercomparison
[NPL-RSA(EXT)-0043] p 1176 N94-15019
Ultrasound absorption in molten salts p 944 N94-15161
Acousto-optical confirmation of the localized wave phenomena
[DE93-016425] p 1177 N94-16448
Digital reverberation time measurement system
[AD-D015892] p 1177 N94-16919
An automated system for ultrasound measurements of liquids by the resonance (Eggers) method
[IFTR-17/1992] p 1178 N94-17087
Noise measurement flight test of five light helicopters
[AD-A268566] p 1179 N94-17599

ACOUSTIC PROPAGATION
Vibro-acoustic analysis of an aircraft maintenance dock
[AD-A266778] p 871 N94-14908
Nonlinear acoustics: Periodic waveguide, scattering of sound by sound, three-layer fluid, finite amplitude sound in a medium having a distribution of relaxation processes, and production of an isolated negative pulse in water
[AD-A267145] p 1177 N94-15732
Sound exposure level prediction for impulse sound sources above variable terrain
[AD-A267535] p 1178 N94-17119

ACOUSTIC PROPERTIES
Segment-based acoustic models for continuous speech recognition
[AD-A267138] p 988 N94-15691
Effect of wind tunnel acoustic modes on linear oscillating cascade aerodynamics
[NASA-TM-106367] p 869 N94-15866
Real time system for practical acoustic monitoring of global ocean temperature
[AD-A267868] p 1113 N94-17391
Noise measurement flight test of five light helicopters
[AD-A268566] p 1179 N94-17599

ACOUSTIC SCATTERING
Nonlinear acoustics: Periodic waveguide, scattering of sound by sound, three-layer fluid, finite amplitude sound in a medium having a distribution of relaxation processes, and production of an isolated negative pulse in water
[AD-A267145] p 1177 N94-15732
Modal ring method for the scattering of sound
[NASA-TM-106342] p 1177 N94-16497

ACOUSTIC VELOCITY
The shock Hugoniot of 316 SS and sound velocity measurements
[DE93-016525] p 1178 N94-16955
Acoustic waves in complicated geometries and their interactions with liquid-propellant droplet combustion
[AD-A267260] p 1178 N94-16991
Real time system for practical acoustic monitoring of global ocean temperature
[AD-A267868] p 1113 N94-17391

ACOUSTO-OPTICS
Alternative optical architectures for multichannel adaptive optical processing
[AD-A267052] p 1189 N94-15664
Display system employing acousto-optic tunable filter
[NASA-CASE-NPO-18736-1-CU] p 1190 N94-15933
Wideband acousto-optic correlator for an ESM receiver upgrade
[TABES PAPER 93-661] p 1054 N94-16156
Acousto-optical confirmation of the localized wave phenomena
[DE93-016425] p 1177 N94-16448
JPL activities on development of acousto-optic tunable filter imaging spectrometer p 1037 N94-16696
Acousto-optical classifier
[AD-D015894] p 1000 N94-16921
Two-dimensional acousto-optical interaction theory and experimental analysis
[AD-A267761] p 1193 N94-17254
Frequency resolution of an acousto-optical spectrometer
[AD-A267822] p 1035 N94-17401
Study of high speed interference photography with two-dimensional acousto-optical lattice deflection
[AD-A267823] p 1035 N94-17402

ACRYLATES
Interpenetrating polymer network acoustic damping material
[AD-D015889] p 969 N94-16916

ACRYLONITRILES
Characterization of the lithium/pan-based polymer electrolytes interface
[AD-A268401] p 973 N94-17434

ACTINIDE SERIES
Theoretical studies of the crystal structure of rare earths and actinides at zero temperature
[DE93-016488] p 1214 N94-17301

ACTIVATION ENERGY
Structural effects in electron transfer reactions: Comparative interfacial electrochemical kinetics for cis-versus trans-dioxorhenium (V) (bi)pyridine oxidation
[AD-A266307] p 1182 N94-16466
Solvational barriers to interfacial electron transfer: Minimization by way of valence delocalization
[AD-A267371] p 950 N94-17006

ACTIVE CONTROL
Aerodynamic/dynamic/control interaction
[AD-A266187] p 871 N94-16107
Controls of maglev suspension systems
[DE93-015540] p 1011 N94-16443
Active turbulence control in wall bounded flows using direct numerical simulation
[AD-A267261] p 1028 N94-17286

ACTIVE GALACTIC NUCLEI
Astrophysics with MILAGRO
[DE93-012722] p 1240 N94-17657

ACTS
Proceedings of the Fifteenth NASA Propagation Experimenters Meeting (NAPEX 15) and the Advanced Communications Technology Satellite (ACTS) Propagation Studies Miniworkshop
[NASA-CR-194539] p 994 N94-16035
The ACTS propagation program p 995 N94-16039
Propagation measurements in Alaska using ACTS beacons p 995 N94-16040
Planned LMSS propagation experiment using ACTS: Preliminary antenna pointing results during mobile operations p 995 N94-16041
Propagation-related AMT design aspects and supporting experiments p 995 N94-16042

ACTUATOR DISKS
Electro-rheological disk pump
[AD-D015783] p 1047 N94-16531

ACTUATORS
YARF: An open-ended framework for robot road following
[AD-A266788] p 1163 N94-14910
Advanced cooling for high power electric actuators
[AD-A266984] p 866 N94-15761
ALS engine propellant effector system
[NASA-CR-194650] p 926 N94-16590
Design of a fluid elastic actuator with application to structure control
[AD-A267649] p 897 N94-17246
Optimal tuning of heavy equipment motion controllers
[AD-A267873] p 1167 N94-17392
A comparative study of analog and digital control laws for the UMCSL truss
[AD-A267980] p 871 N94-17412

ADA (PROGRAMMING LANGUAGE)
Evaluation of ALSYS 037 Ada Compiler
[AD-A266972] p 1143 N94-15110
Proceedings of the Association for Computing Machinery Special Interest Group for Ada Artificial Intelligence Working Group
[AD-A266422] p 1165 N94-16559
An examination of two Ada language object-oriented databases
[AD-A267486] p 1154 N94-17366

ADAPTATION
The bootstrapped algorithm: Fast algorithm for blind signal separation
[AD-A266671] p 1147 N94-15772

ADAPTIVE CONTROL
Contribution to the elaboration of some adaptive control algorithms for fermentation processes monitoring
[LAAS-92513] p 1116 N94-15643
Neural-network-directed alignment of optical systems using the laser-beam spatial filter as an example
[NASA-TP-3372] p 1034 N94-15961
Adaptive weld control for high-integrity welding applications
[TABES PAPER 93-604] p 1049 N94-16140
Information technology division technical paper abstracts
[AD-A266227] p 1166 N94-16938

ADAPTIVE FILTERS
Broadband conventional beamforming incorporating adaptive equalization
[AD-A267090] p 987 N94-15544
Adaptive median filtering for preprocessing of time series measurements p 912 N94-15561
Adaptive interference canceller
[CA-PATENT-1-310-709] p 988 N94-15698
Development and analysis of ARMA parameter estimation schemes in the presence of noise
[AD-A267184] p 989 N94-15786
Cortical adaptive filtering in bioacoustic signal classification
[AD-A266229] p 1177 N94-16939

ADAPTIVE OPTICS
Neural-network-directed alignment of optical systems using the laser-beam spatial filter as an example
[NASA-TP-3372] p 1034 N94-15961
Tip-tilt compensation: Resolution limits for ground-based telescopes using laser guide star adaptive optics
[DE93-016426] p 1237 N94-16872

ADDITIVES
Growth of new materials for solid state laser applications. The growth of ZnGeP2 by the vertical Bridgman method
[NASA-CR-194571] p 1038 N94-15530
Optoelectronics based on SiGe/Si heterostructures
[AD-A267178] p 1190 N94-15848
Ion doped quantum well lasers
[AD-A267198] p 1038 N94-15853
Local environment about O atoms in Pr-Y-Ba-Cu-O films studied by O K-edge XAFS
[DE93-016218] p 1209 N94-16447
Method for doping GaAs with high vapor pressure elements
[AD-D015794] p 1210 N94-16538
Vanadium corrosion studies
[AD-A266489] p 959 N94-16781

ADDRESSING
Generating local addresses and communication sets for data-parallel programs
[NASA-CR-194605] p 1159 N94-15796

ADHESION
Ion mixing of thin ZrO2 films on sapphire
[DE93-015214] p 1206 N94-14925
The effect of plasma treatment on interfacial bond characteristics of Kevlar/epoxy laminates as measured by T-peel tests
[AD-A266920] p 930 N94-14999
Engineering design of sub-micron topographies for simultaneously adherent and reflective metal-polymer interfaces
[NASA-CR-194573] p 964 N94-15700

Weibull analysis applied to the pull adhesion test and fracture of a metal-ceramic interface
[DE93-012913] p 1059 N94-15997
Interface chemistry in ceramic matrix composites
[AD-A268629] p 973 N94-17466
Continuing research on friction and wear of materials
[AD-A268291] p 1049 N94-17566

ADHESION TESTS
Weibull analysis applied to the pull adhesion test and fracture of a metal-ceramic interface
[DE93-012913] p 1059 N94-15997

ADHESIVE BONDING
Weibull analysis applied to the pull adhesion test and fracture of a metal-ceramic interface
[DE93-012913] p 1059 N94-15997

ADHESIVES
Materials Research Society Symposium Proceedings, Volume 292: Biomolecular Materials
[AD-A265776] p 1116 N94-15138

ADIABATIC CONDITIONS
Breakdown of adiabatic invariance
[AD-A267246] p 1219 N94-14977

ADIRONDACK MOUNTAINS (NY)
Broadband teleseismic array recording in the Adirondack Mountains, New York State
[AD-A267290] p 1097 N94-14960

ADSORBENTS
Structural and dynamical aspects of electrodeposition
[AD-A266786] p 942 N94-14909
Trace analysis of chemical warfare agents in air: Sampling in porous polymers followed with thermal desorption analysis
[FOA-C-40302-4.6] p 1097 N94-17625

ADSORPTION
The thermal dissociation of NH2CHO(ND2CHO) on Si(100)-2x1
[AD-A266903] p 942 N94-14956
Theoretical prediction of the UV adsorption and fluorescence spectra of tyrosine and phenylalanine
[AD-A266970] p 943 N94-15111
The role of interfacial chemistry in surface nucleation and growth of calcium oxalate
[DE93-015689] p 1209 N94-16159
Thermal disorder in adsorbed Cl on Si(100)
[AD-A266295] p 1210 N94-16476
On-line gas chromatographic studies of Rutherfordium (element 104), hahnium (element 105), and homologs
[DE93-013890] p 948 N94-16821
Regulation of attached bacterial growth by adsorbed proteins
[AD-A267756] p 1118 N94-17275

ADVANCED LAUNCH SYSTEM (STS)
ALS engine propellant effector system
[NASA-CR-194650] p 926 N94-16590
ALS engine controller system
[NASA-CR-194647] p 926 N94-16654
ALS liquid hydrogen turbopump
[NASA-CR-194646] p 927 N94-17016

ADVANCED SOLID ROCKET MOTOR (STS)
Advanced Solid Rocket Motor
[NASA-TM-109658] p 924 N94-15229
ASRM nozzle thermal analysis
[NASA-CR-194672] p 928 N94-17277

ADVANCED VERY HIGH RESOLUTION RADIOMETER
Sea ice motions in the central arctic ice central arctic pack ice as inferred from AVHRR imagery
[NASA-CR-194572] p 1112 N94-15701
Simulation of AVHRR-K band ratios with AVIRIS
p 1075 N94-16714

ADVECTION
A domain-partition method for the advection-diffusion equation
[INRIA-RR-1740] p 1030 N94-17534

AERATION
Investigation of the influence of applied potential on erosion-corrosion of copper in alkaline chloride solutions
[AD-A266448] p 958 N94-16562

AERIAL PHOTOGRAPHY
Johnson Space Center and downtown Houston, Texas aerials
[NASA-TM-109522] p 1032 N94-15472
The use of TIMS data to estimate the SO2 concentrations of volcanic plumes: A case study at Mount Etna, Sicily p 1065 N94-16608

AERIAL RECONNAISSANCE
AIRSAR South American deployment: Operation plan, version 3.0 p 994 N94-15919

AEROBRAKING
Minimum accommodation for aerobrake assembly. Phase 2: Structural concepts for a lunar transfer vehicle aerobrake which can be assembled on orbit
[NASA-TM-107610] p 885 N94-15446

AEROCAPTURE
Nonequilibrium radiation and chemistry models for aerocapture vehicle flowfields
[NASA-CR-194645] p 1027 N94-17095

AERODYNAMIC BRAKES
Tetrahedral lander
[NASA-CASE-MSC-22082-1] p 886 N94-15951

AERODYNAMIC CHARACTERISTICS
Vertical-tail aerodynamic configuration of space shuttle orbiter
[AD-A267723] p 879 N94-14941
Aerodynamic flight control to increase payload capability of future launch vehicles
[NASA-CR-193850] p 870 N94-15532
Heat transfer and aerodynamics of a 3D design nozzle guide vane tested in the Pyestock isentropic light piston facility
[RAE-TM-AERO/PROP-19] p 856 N94-15696
Aerodynamic control of NASP-type vehicles through vortex manipulation, volume 4
[NASA-CR-177626-VOL-4] p 857 N94-15720
Experimental study of vortex and aerodynamic characteristics of stack wings with sideslip
[AD-A267722] p 860 N94-17274
Subsonic aerodynamic characteristics of the HL-20 lifting-body configuration
[NASA-TM-4515] p 861 N94-17284

AERODYNAMIC CONFIGURATIONS
Vertical-tail aerodynamic configuration of space shuttle orbiter
[AD-A267723] p 879 N94-14941
The effect of the nose shape and wing location toward the wing vortex breakdown
[AD-A267724] p 855 N94-14942
Aerodynamic control of NASP-type vehicles through Vortex manipulation. Volume 1: Static water tunnel tests
[NASA-CR-177626-VOL-1] p 855 N94-15655
Aerodynamic control of NASP-type vehicles through Vortex manipulation. Volume 2: Static wind tunnel tests
[NASA-CR-177626-VOL-2] p 856 N94-15677
Missile datcom user's manual
[AD-A267447] p 1152 N94-17032
Single block three-dimensional volume grids about complex aerodynamic vehicles
[NASA-TM-108986] p 1030 N94-17476

AERODYNAMIC DRAG
The turbulent wall jet
[AD-A267675] p 855 N94-14963
On the delivery of planetesimals to a protoplanet in the solar nebula p 1245 N94-16379
Dust grain resonant capture: A statistical study
p 1245 N94-16384
Low Earth orbit constellations: Orbit control or not
p 875 N94-17134
Equations of motion of a hinged body over a spherical earth
[AD-A268408] p 868 N94-17435

AERODYNAMIC FORCES
Aeroelastic airfoil smart spar p 868 N94-16865

AERODYNAMIC HEATING
Incorporation of boundary layer heating predictive methodology into NSWCDD aeroprediction code
[AD-A267000] p 1020 N94-15632
Aerothermoelastic analysis of a NASP demonstrator model
[NASA-TM-109007] p 867 N94-17055

AERODYNAMIC INTERFERENCE
Development of an air-to-air refueling automatic flight control system using quantitative feedback theory
[AD-A266718] p 870 N94-15730
Wall interference and boundary simulation in a transonic wind tunnel with a discretely slotted test section
[NASA-TP-3334] p 872 N94-15794
Determination of the effect of the walls of a wind-tunnel from the parameters of flow near them
[RAE-LIB-TRANS-2201] p 859 N94-16583

AERODYNAMIC LOADS
Aerodynamic/dynamic/control interaction
[AD-A266187] p 871 N94-16107
Computation of a controlled store separation from a cavity p 858 N94-16513
Fatigue life program using strain-life methods
[AD-A267310] p 1060 N94-16943
A review of Australian and New Zealand investigations on aeronautical fatigue during the period April 1991 to March 1993
[AD-A267532] p 868 N94-17117

AERODYNAMIC NOISE
Development of a quiet supersonic wind tunnel with a cryogenic adaptive nozzle
[NASA-CR-194548] p 871 N94-15117

AERODYNAMIC STABILITY
Static aeroelastic response of an aircraft with asymmetric wing planforms representative of combat damage
[AD-A266890] p 865 N94-14951
Wind shear and heavy rain --- effects on flight stability
[NASA-TM-109453] p 1105 N94-15326
Aerodynamic control of NASP-type vehicles through Vortex manipulation. Volume 1: Static water tunnel tests
[NASA-CR-177626-VOL-1] p 855 N94-15655
Wind tunnel investigation with an operational turbojet engine
[TABES PAPER 93-662] p 870 N94-16157
Aerothermoelastic analysis of a NASP demonstrator model
[NASA-TM-109007] p 867 N94-17055
Subsonic aerodynamic characteristics of the HL-20 lifting-body configuration
[NASA-TM-4515] p 861 N94-17284

AERODYNAMIC STALLING
Suppression of dynamic stall with a leading-edge slat on a VR-7 airfoil
[NASA-TP-3357] p 856 N94-15657

AERODYNAMICS
Aerodynamic flight control to increase payload capability of future launch vehicles
[NASA-CR-193850] p 870 N94-15532
An electronic imaging system for the Aeroballistic Research Facility
[AD-A267157] p 1033 N94-15826
Aeronautical engineering: A continuing bibliography with indexes (supplement 295)
[NASA-SP-7037(295)] p 854 N94-16480
Missile datcom user's manual
[AD-A267447] p 1152 N94-17032
Computational aerodynamics with icing effects
[AD-A267509] p 860 N94-17074
User's manual for the Langley Research Center 14- by 22- foot subsonic tunnel static data acquisition system
[NASA-TM-109027] p 861 N94-17639

AEROELASTICITY
Static aeroelastic response of an aircraft with asymmetric wing planforms representative of combat damage
[AD-A266890] p 865 N94-14951
Physical properties of the benchmark models program supercritical wing
[NASA-TM-4457] p 866 N94-15722
Center for Rotorcraft Education and Research progress report, 1987 - 1992
[AD-A266760] p 857 N94-15824
A rapid computational model for estimating the performance of compliant airfoils in cascades
[AD-A266275] p 857 N94-16471
ASTROS enhancements. Volume 1: ASTRO user's manual
[AD-A266818] p 1151 N94-16768
ASTROS enhancements. Volume 2: ASTRO programmer's manual
[AD-A266819] p 1151 N94-16769
Aeroelastic airfoil smart spar p 868 N94-16865
Flutter analysis using transversality theory
[NASA-TM-106382] p 1062 N94-17481

AEROGELS
Removal of carbonaceous contaminants from silica aerogel p 953 N94-16256

AERONAUTICAL ENGINEERING
Symposium on the Future of Aeronautics in the Netherlands
[ETN-93-93780] p 853 N94-15120
Fifty years of the Netherlands Association of Aeronautical Engineers p 853 N94-15121
Predicted and real development in the aviation in the period 1961-1991 p 853 N94-15122
Center for Rotorcraft Education and Research progress report, 1987 - 1992
[AD-A266760] p 857 N94-15824
Aeronautical engineering: A continuing bibliography with indexes (supplement 295)
[NASA-SP-7037(295)] p 854 N94-16480

AERONAUTICAL SATELLITES
Propagation research in Japan p 996 N94-16043

AERONAUTICS
NACA-NASA: 75 years of flight
[NASA-TM-109449] p 1302 N94-15322
Maximizing participation of women in collegiate aviation education
[NIAR-93-14] p 1222 N94-17261

AERONOMY
An assessment of acid fog
[DE93-009347] p 1095 N94-15940

AEROSOLS
Preliminary analysis of University of North Dakota aircraft data from the FIRE Cirrus IFO-2
[NASA-CR-193357] p 866 N94-15429
An assessment of acid fog
[DE93-009347] p 1095 N94-15940
Spatial and frequency diversity in lidar systems
[AD-A266192] p 1039 N94-16124
Altitude profile of aerosols on Mars from measurements of its thermal radiation on limb p 1294 N94-16423
Hyperspectral modeling for extracting aerosols from aircraft/satellite data p 1067 N94-16873

Mechanistic models of soot formation
[AD-A267806] p 950 N94-17008
BACKSCAT lidar simulation version 3.0: Technical documentation and users guide
[AD-A267296] p 1003 N94-17268

AEROSPACE ENGINEERING
Processing and protection of high temperature structural materials
[AD-A267292] p 954 N94-14961
Symposium on the Future of Aeronautics in the Netherlands
[ETN-93-93780] p 853 N94-15120
Developments in the Higher Technical Aerospace Education p 854 N94-15130
Expectations for the future of the Faculty of Aeronautics and Astronautics of the Technical University of Delft p 854 N94-15131
The 1969 highlights
[NASA-TM-109630] p 1301 N94-15241
The 1972 highlights
[NASA-TM-109631] p 1301 N94-15242
The 1965 highlights — NASA programs
[NASA-TM-109632] p 1301 N94-15243
The 1967 highlights
[NASA-TM-109633] p 1301 N94-15244
NACA-NASA: 75 years of flight
[NASA-TM-109449] p 1302 N94-15322
NASA images 7
[NASA-TM-109438] p 1235 N94-15337
NAS technical summaries: Numerical aerodynamic simulation program, March 1991 - February 1992
[NASA-TM-109335] p 854 N94-15798
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 32: A new era in international technical communication: American-Russian collaboration
[NASA-TM-109336] p 1230 N94-15838
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 34: Technical communications practices and the use of information technologies as reported by Dutch and US aerospace engineers
[NASA-TM-109337] p 1230 N94-15839
TABES 1993: 9th Annual Technical and Business Exhibition and Symposium p 1050 N94-16129
Impact of TQM concepts on inspection of aerospace systems
[TABES PAPER 93-350] p 1050 N94-16130
Approaching the new reality
[TABES PAPER 93-230] p 1050 N94-16131
Commercial space opportunities advanced concepts and technology overview
[TABES PAPER 93-240] p 1050 N94-16132
Commonwealth of Independent States aerospace science and technology, 1992: A bibliography with indexes
[NASA-SP-7106] p 854 N94-16481
Space Nuclear Facility test capability at the Baikal-1 and IGR sites Semipalatinsk-21, Kazakhstan
[DE93-011662] p 926 N94-16773
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 15: Technical uncertainty and project complexity as correlates of information use by US industry-affiliated aerospace engineers and scientists: Results of an exploratory investigation
[NASA-TM-107693] p 1233 N94-17291
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 15: Technical uncertainty and project complexity as correlates of information use by US industry-affiliated aerospace engineers and scientists: Results of an exploratory investigation
[NASA-TM-107693] p 1233 N94-17300

AEROSPACE ENVIRONMENTS
Autogenic-Feedback Training (AFT) as a preventive method for space motion sickness: Background and experimental design
[NASA-TM-108780] p 1120 N94-15537
Atomic beam studies relevant to the space environment
[AD-A268628] p 1186 N94-17436
Design of an experiment hardware for the ESA space facility BIOPAN
[DLR-FB-93-06] p 876 N94-17548

AEROSPACE INDUSTRY
TABES 1993: 9th Annual Technical and Business Exhibition and Symposium p 1050 N94-16129
Government/contractor development teams
[TABES PAPER 93-460] p 1050 N94-16134
Space Propulsion Synergy Group ETO technology assessments
[TABES PAPER 93-641] p 929 N94-16149
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 15: Technical uncertainty and project complexity as correlates of information use by US industry-affiliated aerospace engineers and scientists: Results of an exploratory investigation
[NASA-TM-107693] p 1233 N94-17291
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 15: Technical uncertainty and project complexity as correlates of information use by US industry-affiliated aerospace engineers and scientists: Results of an exploratory investigation
[NASA-TM-107693] p 1233 N94-17300

AEROSPACE MEDICINE
Living well in space: Ensuring crew capability
[NASA-TM-109538] p 1120 N94-15369
Living well in space: Clinical care challenge
[NASA-TM-109539] p 1120 N94-15370
Answering the space medicine challenge
[NASA-TM-109511] p 1120 N94-15457
Autogenic-Feedback Training (AFT) as a preventive method for space motion sickness: Background and experimental design
[NASA-TM-108780] p 1120 N94-15537
Reliability of autonomic responses and malaise across multiple motion sickness stimulation tests
[NASA-TM-108787] p 1121 N94-15711
Exposure fluctuations of astronauts due to orientation
[NASA-TP-3364] p 1300 N94-15816
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 378)
[NASA-SP-7011(378)] p 1122 N94-16478
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 380)
[NASA-SP-7011(380)] p 1122 N94-16479
Evaluation of putative neurochemical intermediaries in space/motion sickness
[NASA-CR-193607] p 1118 N94-17090
Aircrew/groundcrew life support systems research. Volume 1: CLIN 0001 research requirements
[AD-A268229] p 1139 N94-17563
Aircrew/groundcrew life support systems research. Volume 2: CLIN 0002 task order requirements
[AD-A268230] p 1139 N94-17564

AEROSPACE PLANES
Aerothermoelastic analysis of a NASP demonstrator model
[NASA-TM-109007] p 867 N94-17055

AEROSPACE SAFETY
Gearing up for 1988
[NASA-TM-109617] p 880 N94-15346
Living well in space: Clinical care challenge
[NASA-TM-109539] p 1120 N94-15370

AEROSPACE SCIENCES
Short walk to everywhere --- Space, Earth, Ocean Center
[NASA-TM-109541] p 1221 N94-15372
Challenger Center
[NASA-TM-109432] p 1221 N94-15504
Challenger Center: Orientation
[NASA-TM-109433] p 1221 N94-15505
Coast encounters: A space age adventure in science literacy
[NASA-TM-109334] p 1229 N94-15523
Report on computing and networking in the Space Science Laboratory by the SSL Computer Committee
[NASA-TM-108422] p 1147 N94-15721
Teaching planetary sciences to elementary school teachers: Programs that work p 1222 N94-16346
Spaceship Earth: A partnership in curriculum writing p 1222 N94-16356
Commonwealth of Independent States aerospace science and technology, 1992: A bibliography with indexes
[NASA-SP-7106] p 854 N94-16481
The impact of industry/university consortia programs on space education
[NASA-TM-109340] p 1222 N94-17441

AEROSPACE SYSTEMS
Impact of TQM concepts on inspection of aerospace systems
[TABES PAPER 93-350] p 1050 N94-16130
Liquid Oxygen (LO2) propellant conditioning concept testing
[TABES PAPER 93-621] p 976 N94-16146
Not ready for the first space war. What about the second?
[AD-A266557] p 1174 N94-16665
ASTROS enhancements. Volume 1: ASTRO user's manual
[AD-A266818] p 1151 N94-16768
ASTROS enhancements. Volume 2: ASTRO programmer's manual
[AD-A266819] p 1151 N94-16769
Satellite control: A comprehensive approach p 878 N94-17158
Space systems environmental interaction studies
[AD-A267280] p 897 N94-17240
Model designation of military aerospace vehicles
[AD-A267852] p 898 N94-17388

AEROSPACE TECHNOLOGY TRANSFER
From space to Earth
[NASA-TM-109638] p 1235 N94-15249
Monitoring history
[NASA-TM-109640] p 1229 N94-15251
NASA images 7
[NASA-TM-109438] p 1235 N94-15337
Improved mapping system
[NASA-TM-109643] p 1082 N94-15428
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 32: A new era in international technical communication: American-Russian collaboration
[NASA-TM-109336] p 1230 N94-15838
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 34: Technical communications practices and the use of information technologies as reported by Dutch and US aerospace engineers
[NASA-TM-109337] p 1230 N94-15839
Commercial space opportunities advanced concepts and technology overview
[TABES PAPER 93-240] p 1050 N94-16132

AEROSPACE VEHICLES
Results of an electrical power system fault study (CDDF)
[NASA-TP-3413] p 884 N94-15007
Model designation of military aerospace vehicles
[AD-A267852] p 898 N94-17388

AEROTHERMODYNAMICS
A rapid computational model for estimating the performance of compliant airfoils in cascades
[AD-A266275] p 857 N94-16471

AEROTHERMOELASTICITY
Aerothermoelastic analysis of a NASP demonstrator model
[NASA-TM-109007] p 867 N94-17055

AGGLOMERATION
Separation behaviour of monotectic alloys p 945 N94-15170

AGGLUTINATION
Nitrogen isotopic signatures in agglutinates from breccia 79035 p 954 N94-16314

AGGREGATES
Study of fractal aggregates p 979 N94-16086
Thermal inertia and radar reflectivity of the Martian north polar ERG: Low-density aggregates p 1260 N94-16238

AGING (MATERIALS)
A model for non-linear creep and physical ageing in PVC
[NPL-DMM(A)-91] p 1057 N94-15016
Monitoring history
[NASA-TM-109640] p 1229 N94-15251
Effects of aging time on V205 sol-gel coatings
[AD-A266824] p 965 N94-15843
The effect of aging at 343 C on the mechanical properties and microstructure of type 308 stainless steel weldments
[DE93-015454] p 957 N94-16103
The influence of thermal aging on the microstructure and fatigue properties of modified 9Cr-1Mo steel
[DE93-015489] p 957 N94-16106
Superconducting ceramics: Selected properties and methods of production
[IFTR-23/1991] p 969 N94-16924

AGING (METALLURGY)
The effect of long-term aging on the impact properties of modified 9Cr-1Mo steel
[DE93-015453] p 957 N94-16068

AGRICULTURE
Comparison of JPL-AIRSAR and DLR E-SAR images from the MAC Europe 1991 campaign over testsite Oberpfaffenhofen: Frequency and polarization dependent backscatter variations from agricultural fields p 1075 N94-16733
Characterization of wetland, forest, and agricultural ecosystems in Belize with airborne radar (AIRSAR) p 1076 N94-16738

AH-64 HELICOPTER
Basic principles of helicopter crashworthiness
[AD-A267099] p 862 N94-15637

AIR
Effects of alloying and temperature on the high-temperature oxidation of Cr-Cr2Nb
[DE93-015800] p 957 N94-16163
Lasing dye sensor for chemical vapors
[AD-D015786] p 1040 N94-16533

AIR BREATHING ENGINES
Flight testing of airbreathing hypersonic vehicles
[NASA-TM-4524] p 886 N94-15753

AIR COOLING
USAF physiological studies of personal microclimate cooling: A review
[AD-A267203] p 1022 N94-15858
Fluid flow and heat convection studies for actively cooled airframes
[NASA-CR-194624] p 1024 N94-16491
Sensitivity of blackbody reference panels to wind blast p 1063 N94-16599

AIR DEFENSE
Expectations for the future of military aviation
p 854 N94-15128
AIR FLOW
The MADONA experiments (Meteorology and Diffusion Over Non-uniform Areas): High-resolution in-plume concentration fluctuations measurements using lidar remote sensing technique
[AD-A267711] p 1105 N94-14938
Boundary layer flow of air over water on a flat plate
[NASA-CR-191517] p 1019 N94-15479
Complex terrain wind model evaluation
[AD-A266467] p 1096 N94-16589
AIR JETS
Fluid flow and heat convection studies for actively cooled airframes
[NASA-CR-194624] p 1024 N94-16491
Analysis of TIMS performance subjected to simulated wind blast p 1063 N94-16598
A comparative study of analog and digital control laws for the UMCSL truss
[AD-A267980] p 871 N94-17412
AIR LAND INTERACTIONS
Evapotranspiration and runoff from large land areas: Land surface hydrology for atmospheric general circulation models p 1083 N94-16029
Heterogeneity and scaling land-atmospheric water and energy fluxes in climate systems p 1083 N94-16030
Effects of spatial variability and scale on areal -average evapotranspiration p 1084 N94-16033
AIR LOCKS
STS-36 crew EVA prep and post-training, bailout exercises, final bench review
[NASA-TM-109498] p 1137 N94-15462
AIR PIRACY
Criminal acts against civil aviation, fiscal year 1992
[AD-A268014] p 863 N94-17586
AIR POLLUTION
An assessment of acid fog
[DE93-009347] p 1095 N94-15940
New York MARKAL: An evaluation of carbon dioxide emission control strategies in New York State
[DE93-013149] p 1095 N94-15999
TABES 1993: 9th Annual Technical and Business Exhibition and Symposium p 1050 N94-16129
NASA Operational Environment Team (NOET): NASA's key to environmental technology
[TABES PAPER 93-611] p 1052 N94-16143
Emerging technologies for the changing global market
[TABES PAPER 93-612] p 930 N94-16144
Utility emissions associated with electric and hybrid vehicle (EHV) charging
[DE93-013734] p 1011 N94-16459
Biomass energy: State of the technology present obstacles and future potential
[DE93-016295] p 1092 N94-16766
Incorporating global warming risks in power sector planning. Volume 1: A case study of the New England region
[DE93-015241] p 1096 N94-17289
AIR PURIFICATION
Plant research
[NASA-TM-109664] p 1116 N94-15235
AIR QUALITY
NASA Operational Environment Team (NOET): NASA's key to environmental technology
[TABES PAPER 93-611] p 1052 N94-16143
Utility emissions associated with electric and hybrid vehicle (EHV) charging
[DE93-013734] p 1011 N94-16459
The 11th annual report of accomplishments under the airport improvement program: Fiscal year 1992
[AD-A268328] p 865 N94-17458
AIR SAMPLING
Space Shuttle solid rocket motor exposure monitoring
p 976 N94-16624
Trace analysis of chemical warfare agents in air: Sampling in porous polymers followed with thermal desorption analysis
[FOA-C-40302-4.6] p 1097 N94-17625
AIR SEA ICE INTERACTIONS
Sea ice motions in the central arctic ice central arctic pack ice as inferred from AVHRR imagery
[NASA-CR-194572] p 1112 N94-15701
AIR TO AIR REFUELING
Development of an air-to-air refueling automatic flight control system using quantitative feedback theory
[AD-A266718] p 870 N94-15730
AIR TRAFFIC
Strategic planning for aircraft noise route impact analysis: A three dimensional approach
[NASA-CR-191484] p 1178 N94-17278
AIR TRAFFIC CONTROL
Symposium on the Future of Aeronautics in the Netherlands
[ETN-93-93780] p 853 N94-15120
Developments in the European air traffic control
p 853 N94-15124
The Next Generation Weather Radar (NEXRAD)/Air Route Surveillance Radar (ARSR) operational comparison
[REPT-93W0000145] p 987 N94-15439
ATCRBS reply environment at Memphis International Airport
[AD-A266322] p 864 N94-16439
The 11th annual report of accomplishments under the airport improvement program: Fiscal year 1992
[AD-A268328] p 865 N94-17458
AIR TRAFFIC CONTROLLERS (PERSONNEL)
Developments in the European air traffic control
p 853 N94-15124
AIR TRANSPORTATION
An analysis of tactical airlifter characteristics and their impact on theater airlift system performance
[AD-A266719] p 866 N94-15731
The airline quality report 1993
[NIAR-93-11] p 863 N94-17262
Annual review of aircraft accident data. US air carrier operations, calendar year 1990
[PB94-102787] p 863 N94-17471
AIR WATER INTERACTIONS
Fine scale measurements of microwave backscatter from the ocean surface
[AD-A264516] p 1111 N94-15134
Ocean wave study
[NASA-TM-109620] p 1111 N94-15349
Exploring the southern ocean response to climate change
[NASA-CR-194601] p 1112 N94-15680
Ventilated oscillatory boundary layers
[AD-A266226] p 1023 N94-16110
Observations and modelling of winds and waves during the Surface Wave Dynamics Experiment. Report 1: Intensive observation period IOP-1, 20-31 October 1990
[AD-A266384] p 1113 N94-16517
The use of General Circulation Models in detecting climate change induced by greenhouse gases
[DE93-014369] p 1096 N94-16802
Orographic microbursts in a severe winter windstorm
[AD-A267651] p 1108 N94-17247
Abstracts of manuscripts submitted in 1992 for publication
[AD-A267963] p 1113 N94-17383
Real time system for practical acoustic monitoring of global ocean temperature
[AD-A267868] p 1113 N94-17391
Preliminary estimates of frequency-direction spectra derived from the SAMSON pressure gage array, November 1990 to May 1991
[AD-A267960] p 1114 N94-17497
Meridional circulation in the tropical north atlantic
[AD-A268222] p 1114 N94-17555
AIRBORNE EQUIPMENT
Windshear detection radar signal processing studies
[NASA-CR-194615] p 994 N94-16022
Optical measurements of NASA/USAF CRRES high altitude rocket borne chemical release experiments in conjunction with the USAF airborne ionospheric observatory aircraft
[AD-A266404] p 1101 N94-16551
Summaries of the Third Annual JPL Airborne Geoscience Workshop. Volume 3: AIRSAR Workshop
[NASA-CR-194542] p 1075 N94-16731
Laser beam steering device p 1045 N94-17357
AIRBORNE LASERS
Nd:YLF laser for airborne/spaceborne laser ranging
p 913 N94-15563
AIRBORNE/SPACEBORNE COMPUTERS
STS-34 Space Shuttle Portable Onboard Computer (SPOC) briefing
[NASA-TM-109458] p 880 N94-15353
NASA Space Engineering Research Center for VLSI System Design
[NASA-CR-194587] p 1008 N94-15547
Satellite communications installation plan
[AD-A266303] p 1000 N94-16965
Data handling strategy for the Spanish small satellite program (MINISAT) p 895 N94-17177
The STRV On Board Data Handling (OBDH) system: An introduction p 895 N94-17178
AIRCRAFT ACCIDENT INVESTIGATION
Aircraft accident investigation at ARL: The first 50 years
[AD-A267086] p 862 N94-15542
Annual review of aircraft accident data. US air carrier operations, calendar year 1990
[PB94-102787] p 863 N94-17471
AIRCRAFT ACCIDENTS
Aircraft accident investigation at ARL: The first 50 years
[AD-A267086] p 862 N94-15542
Basic principles of helicopter crashworthiness
[AD-A267099] p 862 N94-15637
National Transportation Safety Board annual review of aircraft accident data, US general aviation, calendar year 1989
[PB93-160687] p 863 N94-16464
Annual review of aircraft accident data. US air carrier operations, calendar year 1990
[PB94-102787] p 863 N94-17471
AIRCRAFT COMMUNICATION
Johnson-Gierhart program predictions of excess propagation loss for super-high frequency air-to-ground paths. Volume 1: Theory and numerical results
[AD-A267105] p 988 N94-15649
AIRCRAFT CONFIGURATIONS
Adaptive algorithm for aircraft configuration in turbulent flow
[AD-A266188] p 867 N94-16122
Computational aerodynamics with icing effects
[AD-A267509] p 860 N94-17074
AIRCRAFT CONSTRUCTION MATERIALS
An overview of the NASA textile composites program
p 937 N94-16846
Techno-economic requirements for composite aircraft components p 940 N94-16864
Aircraft carrier exposure tests of cast magnesium alloys
[AD-A268260] p 962 N94-17418
AIRCRAFT CONTROL
Aerodynamic control of NASP-type vehicles through vortex manipulation, volume 4
[NASA-CR-177626-VOL-4] p 857 N94-15720
Development of an air-to-air refueling automatic flight control system using quantitative feedback theory
[AD-A266718] p 870 N94-15730
AIRCRAFT DESIGN
Expectations for the future of Fokker
p 854 N94-15127
Better airplane wings
[NASA-TM-109446] p 933 N94-15345
The lift-fan powered-lift aircraft concept: Lessons learned
[NASA-CR-177616] p 866 N94-15718
AIRCRAFT ENGINES
Flight-determined engine exhaust characteristics of an F404 engine in an F-18 airplane
[NASA-TM-4538] p 869 N94-15141
A review of Australian and New Zealand investigations on aeronautical fatigue during the period April 1991 to March 1993
[AD-A267532] p 868 N94-17117
Micromechanisms of monotonic and cyclic subcritical crack growth in advanced high melting point low-ductility intermetallics
[AD-A267764] p 961 N94-17223
Structured finite volume modeling of US Navy aircraft engine test cells task 2: Turboprop engine, volume 1
[AD-A267833] p 872 N94-17405
Structured finite volume modeling of US Navy aircraft engine test cells. Task 1: Turboshaft engine, volume 1
[AD-A268176] p 873 N94-17432
Structured finite volume modeling of US Navy aircraft engine test cells. Task 1: Turboshaft engine-code documentation and listings, volume 2
[AD-A268177] p 873 N94-17508
Structured finite volume modeling of US Navy aircraft engine test cells. Task 2: Turboprop engine. Volume 2: Code documentation and listings
[AD-A268386] p 873 N94-17569
AIRCRAFT EQUIPMENT
Regulated emergency oxygen system
[AD-A266228] p 1138 N94-16983
AIRCRAFT HAZARDS
Development of a proposed international standard for certification of aircraft to High Intensity Radiated Fields (HIRF)
[NASA-TM-106357] p 863 N94-16520
Windshear database for forward-looking systems certification
[NASA-TM-109012] p 1108 N94-17283
AIRCRAFT HYDRAULIC SYSTEMS
High temperature hydraulic seals
[AD-A268257] p 1048 N94-17433
AIRCRAFT ICING
The 1982 highlights
[NASA-TM-109671] p 1303 N94-15508
Computational aerodynamics with icing effects
[AD-A267509] p 860 N94-17074
AIRCRAFT LANDING
An analysis of tactical airlifter characteristics and their impact on theater airlift system performance
[AD-A266719] p 866 N94-15731
AIRCRAFT MAINTENANCE
Mission management aircraft operations manual
[NHB-7900.3] p 1225 N94-16729

Definitions of terms relating to aircraft windscreens, canopies, and transparencies
[AD-A268403] p 868 N94-17425
Overview of the FAA/DCA/NLR programs related to ageing aircraft
[NLR-TR-92119-U] p 854 N94-17614

AIRCRAFT MANEUVERS
Aerodynamic/dynamic/control interaction
[AD-A266187] p 871 N94-16107

AIRCRAFT MODELS
National Aero-Space Plane
[NASA-TM-109450] p 865 N94-15323
National Aero-Space Plane resource reel
[NASA-TM-109451] p 865 N94-15324
An introduction to structural models
[AD-A268151] p 1155 N94-17429

AIRCRAFT NOISE
On the use of the noncentral chi-square density function for the distribution of helicopter spectral estimates
[NASA-CR-191546] p 1176 N94-15487
Strategic planning for aircraft noise route impact analysis: A three dimensional approach
[NASA-CR-191484] p 1178 N94-17278
Noise measurement flight test of five light helicopters
[AD-A268566] p 1179 N94-17599

AIRCRAFT PERFORMANCE
Naval aviation: The Navy is taking actions to improve the combat capabilities of its tactical aircraft. Report to Congressional Requesters
[AD-A268002] p 868 N94-17472

AIRCRAFT PILOTS
Monograph of the aviation epidemiology data register for FY 1991
[AD-A266896] p 1119 N94-14952
US civil airmen statistics: Calendar year 1992
[AD-A267708] p 853 N94-14965
Human factor studies
[NASA-TM-109665] p 875 N94-15236

AIRCRAFT PRODUCTION
Government/contractor development teams
[TABES PAPER 93-460] p 1050 N94-16134

AIRCRAFT RELIABILITY
Aircraft operations management manual
[NHB-7900.3(V1)] p 1225 N94-16730

AIRCRAFT SAFETY
NASA images 6
[NASA-TM-109437] p 862 N94-15336
Altitude deviations: Breakdowns of an error-tolerant system
[NASA-TM-108788] p 862 N94-15550
An analysis of tactical airlifter characteristics and their impact on theater airlift system performance
[AD-A266719] p 866 N94-15731
National Transportation Safety Board annual review of aircraft accident data, US general aviation, calendar year 1989
[PB93-160687] p 863 N94-16464
Mission management aircraft operations manual
[NHB-7900.3] p 1225 N94-16729
Aircraft operations management manual
[NHB-7900.3(V1)] p 1225 N94-16730
Regulated emergency oxygen system
[AD-A266228] p 1138 N94-16983
The 11th annual report of accomplishments under the airport improvement program: Fiscal year 1992
[AD-A268328] p 865 N94-17458

AIRCRAFT STABILITY
Wind shear and heavy rain --- effects on flight stability
[NASA-TM-109453] p 1105 N94-15326
Development of an air-to-air refueling automatic flight control system using quantitative feedback theory
[AD-A266718] p 870 N94-15730

AIRCRAFT STRUCTURES
ASTROS enhancements. Volume 1: ASTRO user's manual
[AD-A266818] p 1151 N94-16768
ASTROS enhancements. Volume 2: ASTRO programmer's manual
[AD-A266819] p 1151 N94-16769
An overview of the NASA textile composites program
p 937 N94-16846
Development of test methods for textile composites
p 939 N94-16862
Techno-economic requirements for composite aircraft components p 940 N94-16864
Definitions of terms relating to aircraft windscreens, canopies, and transparencies
[AD-A268403] p 868 N94-17425
Structural mechanics division research and technology accomplishments for CY 1992 and plans for CY 1993
[NASA-TM-107752] p 1062 N94-17479

AIRCRAFT SURVIVABILITY
A review of Australian and New Zealand investigations on aeronautical fatigue during the period April 1991 to March 1993
[AD-A267532] p 868 N94-17117

AIRFIELD SURFACE MOVEMENTS
The use of the Air Force Academy high wind alert system in forecasting moderate intensity wind events for military bases in the Colorado Springs area
[AD-A267648] p 1107 N94-17245

AIRFOILS
Unsteady separated flows: Empirical model and control
[AD-A267282] p 855 N94-14959
Suppression of dynamic stall with a leading-edge slat on a VR-7 airfoil
[NASA-TP-3357] p 856 N94-15657
A rapid computational model for estimating the performance of compliant airfoils in cascades
[AD-A266275] p 857 N94-16471
Hoph bifurcation in viscous, low speed flows about an airfoil with structural coupling
[AD-A266542] p 859 N94-16798

AIRFRAMES
Technical evaluation report on the AGARD-PEP Specialists Meeting on Combat Aircraft Noise
[NLR-TP-91445-U] p 1177 N94-15506
Helicopter structures: A review of loads, fatigue design techniques, and usage monitoring
[AD-A267115] p 866 N94-15651

AIRGLOW
Altitude profile of aerosols on Mars from measurements of its thermal radiation on limb p 1294 N94-16423
Optical ionospheric instrumentation and research
[AD-A266403] p 1192 N94-16550

AIRLINE OPERATIONS
Aviation and the KLM: Past and future
p 853 N94-15126
An elementary tutorial on formal specification and verification using PVS
[NASA-TM-108991] p 1158 N94-15536
The airline quality report 1993
[NIAR-93-11] p 863 N94-17262

AIRPORT PLANNING
Symposium on the Future of Aeronautics in the Netherlands
[ETN-93-93780] p 853 N94-15120
The future of Schiphol: Growth within boundaries
p 853 N94-15123
ATCRBS reply environment at Memphis International Airport
[AD-A266322] p 864 N94-16439

AIRPORTS
The future of Schiphol: Growth within boundaries
p 853 N94-15123
The 11th annual report of accomplishments under the airport improvement program: Fiscal year 1992
[AD-A268328] p 865 N94-17458
Criminal acts against civil aviation, fiscal year 1992
[AD-A268014] p 863 N94-17586

ALASKA
An electromagnetic interference study of potential transmitter sites for the HF Active Auroral Research Program (HAARP)
[AD-A267743] p 1004 N94-17373

ALBEDO
A test of the applicability of independent scattering to high albedo planetary regoliths p 1250 N94-16187
Age determinations and Earth-based multispectral observations of lunar light plains p 1275 N94-16323
Vertical structure models of the 1990 equatorial disturbance on Saturn p 1277 N94-16333

ALBUMINS
Increased vascular resistance with hemoglobin-based oxygen carriers
[AD-A266454] p 1123 N94-16565

ALCOHOLS
Intramolecular versus intermolecular condensation rates in the acidic polymerization of octaethoxytrisiloxane
[AD-A266982] p 963 N94-15490
High octane ethers from synthesis gas-derived alcohols
[DE93-016861] p 975 N94-16898

ALEXANDRITE
Soft x ray emission from Alexandrite laser-matter-interaction
[AD-A267905] p 1042 N94-17378

ALGEBRA
Automatic differentiation of limit functions
[DE93-016376] p 1168 N94-14928

ALGORITHMS
VDM specification of the MD4 message digest algorithm
[NPL-DITC-204/92] p 1142 N94-14944
RAISE specification of the MD4 message digest algorithm
[NPL-DITC-206/92] p 1142 N94-15010
Massively parallel, adaptive, color image processing for autonomous road following
[AD-A266988] p 864 N94-15498
Contribution to the elaboration of some adaptive control algorithms for fermentation processes monitoring
[LAAS-92513] p 1116 N94-15643
Software reliability management through metrics
[AD-A267129] p 1146 N94-15687
Segment-based acoustic models for continuous speech recognition
[AD-A267138] p 988 N94-15691
A parallel adaptive mesh refinement algorithm
[NASA-CR-191530] p 1168 N94-15724
Complexity analysis of real-time reinforcement learning applied to finding shortest paths in deterministic domains
[AD-A266636] p 1131 N94-15742
Processor capacity reserves for multimedia operating systems
[AD-A266639] p 1158 N94-15745
The bootstrapped algorithm: Fast algorithm for blind signal separation
[AD-A266671] p 1147 N94-15772
Efficient algorithmic techniques for combinatorial problems
[AD-A267151] p 1172 N94-15777
Development and analysis of ARMA parameter estimation schemes in the presence of noise
[AD-A267184] p 989 N94-15786
Parallel processing and scientific applications
[AD-A267179] p 1159 N94-15849
Synthetic aperture radar signal processing: Trends and technologies p 992 N94-15908
The alignment-distribution graph
[NASA-CR-194609] p 1148 N94-15956
Generation of artificial helioseismic time-series
[NASA-CR-194612] p 1299 N94-15968
Slidesurfaces with adaptive new definitions (SAND) for transient analysis
[DE93-014909] p 1059 N94-15983
A sequential quadratic programming algorithm using an incomplete solution of the subproblem
[DE93-017439] p 1149 N94-16120
Adaptive algorithm for aircraft configuration in turbulent flow
[AD-A266188] p 867 N94-16122
Passive tracking of a target using an array of sensors
[DE93-015870] p 997 N94-16169
Search for optimal distance spectrum convolutional codes p 998 N94-16509
The (delta)f algorithm for beam dynamics
[DE93-015632] p 1187 N94-16660
Accurate upwind methods for the Euler equations
[NASA-TM-106388] p 1170 N94-16882
Adaptive Cartesian grid methods for representing geometry in inviscid compressible flow
[DE93-016430] p 1025 N94-16894
Applications of the phi-transform
[AD-A266247] p 1170 N94-16940
Target detection by way of Kalman filtering
[AD-A267314] p 1000 N94-16945
Modeling, estimation and control of distributed parameter systems
[AD-A267325] p 1026 N94-17003
Progress in computational unsteady aerodynamics
[NASA-CR-177630] p 860 N94-17081
Intelligent use of CFAR algorithms
[AD-A267755] p 1003 N94-17206
Development and comparison of advanced reduced-basis methods for the transient structural analysis of unconstrained structures
[NASA-TM-109015] p 1061 N94-17259
Validation and analysis of microwave-derived rainfall over the tropics
[AD-A267785] p 1108 N94-17303
Fast algorithms for polynomial interpolation, integration and differentiation
[AD-A267505] p 1154 N94-17370
Optimal tuning of heavy equipment motion controllers
[AD-A267873] p 1167 N94-17392
Testing string superprimitivity in parallel
[AD-A267814] p 1155 N94-17399
Fast Fourier Transforms for nonequispaced data 2
[AD-A268383] p 1171 N94-17420
Orpheus: A synthesis framework for regular architectures
[REPT-93-016] p 1156 N94-17504
FSM test: A functional test generation system for sequential circuits
[REPT-93-017] p 1014 N94-17505
Towards dynamic randomized algorithms in computational geometry
[INRIA-RR-1727] p 1156 N94-17528
How to deduce the far field of an antenna from planar near-field measurements
[NPL-DES-123] p 1006 N94-17545
State space partitioning methods for solving a class of stochastic network problems
[AD-A267494] p 1173 N94-17585

ALIGNMENT
Mobile and replicated alignment of arrays in data-parallel programs
[NASA-CR-194294] p 1158 N94-15113
Heterodyne efficiency for a coherent laser radar with diffuse or aerosol targets
[NASA-CR-194563] p 1038 N94-15477
ALIPHATIC HYDROCARBONS
Cycle performance testing of nonazeotropic mixtures of HFC-142A/HCFC-124 and HFC-32/HCFC-124 with enhanced surface heat exchangers
[DE93-015215] p 1024 N94-16808
ALKALI METALS
Basic optical studies of high T(c) oxide superconductors
[AD-A268148] p 1014 N94-17428
ALKALIES
Analysis of an electromagnetic field in the vicinity of a caustic by asymptotic methods
[IFTR-12/1991] p 998 N94-16653
An asymptotic expansion of an electromagnetic field in the velocity of a caustic in the form of simple waves
[IFTR-14/1991] p 1002 N94-17048
ALKALINE BATTERIES
Lithium D-cell study
[NASA-CR-192705] p 1011 N94-16505
ALKALINE EARTH METALS
Investigation of the influence of applied potential on erosion-corrosion of copper in alkaline chloride solutions
[AD-A266448] p 958 N94-16562
Pulsed laser deposition of metastable Ca(1-x)Sr(x)CuO2 thin films
[DE93-015804] p 1040 N94-16663
ALKANES
Advanced thermally stable jet fuels
[DE93-017711] p 975 N94-16996
ALKENES
Synthetic and mechanistic investigation of olefin polymerization catalyzed by early transition metal compounds
[DE93-018301] p 970 N94-16963
ALLENDE METEORITE
Experimental partitioning of Zr, Ti, and Nb between silicate liquid and a complex noble metal alloy and the partitioning of Ti between perovskite and platinum metal p 962 N94-16287
Chemical and isotopic compositions in acid residues from various meteorites p 1243 N94-16291
A search for noble-gas evidence for presolar oxide grains p 954 N94-16353
Refractory precursor components in an Allende ferromagnesian chondrule p 1245 N94-16412
ALLOCATIONS
Regulation of low Earth orbit satellites p 892 N94-17159
ALLOYING
Ternary alloying effects in polycrystalline (beta)-NiAl
[DE93-012675] p 955 N94-15885
Effects of alloying and temperature on the high-temperature oxidation of Cr-Cr2Nb
[DE93-015800] p 957 N94-16163
Metastable phases in mechanically alloyed aluminum germanium powders
[DE93-008727] p 958 N94-16463
ALLOYS
Visualization of solidification front phenomena
[NASA-CR-193838] p 976 N94-15006
Electron-microscopy study of antiphase boundaries in Cu3Pd and Fe3Al alloys near the order-disorder transition
[ONERA-NT-1993-1] p 1206 N94-15295
Vacancy condensation as the precursor to passivity breakdown
[DE93-012925] p 956 N94-15998
ALPHA PARTICLES
Nb-based SJTJ for nuclear detection: Preliminary results with alpha radiation p 905 N94-15068
Nonlinear gyrofluid models of shear Alfven instabilities in ignited and beam heated toroidal plasmas
[DE93-016235] p 1203 N94-16869
ALPHABETS
Testing string superprimitivity in parallel
[AD-A267814] p 1155 N94-17399
ALTERNATING CURRENT
Technology transfers and reliable oxides
[AD-A266948] p 1175 N94-15758
Method and apparatus for performing scanning tunneling optical absorption spectroscopy
[AD-D015796] p 948 N94-16539
ALTERNATING DIRECTION IMPLICIT METHODS
Development of iterative techniques for the solution of unsteady compressible viscous flows
[NASA-CR-194657] p 1027 N94-17129
ALTIMETERS
Analysis of TOPEX laser retroreflector array characteristics p 915 N94-15578
ALTIMETRY
Emplacement of multiple flow units on very shallow slopes, east Kawelu Planitia flow field, Venus p 1260 N94-16235
Clementine: Anticipated scientific datasets from the Moon and Geographos p 1288 N94-16392
Adequation of mini satellites to oceanic altimetry missions p 891 N94-17152
ALTITUDE
The distribution of large volcanoes on Venus as a function of height and altitude p 1271 N94-16303
A quantitative analysis of TIMS data obtained on the Learjet 23 at various altitudes p 1063 N94-16597
ALTITUDE SICKNESS
Metabolic monitoring of hypobaric subjects
[AD-A268221] p 1130 N94-17554
ALTITUDE SIMULATION
Metabolic monitoring of hypobaric subjects
[AD-A268221] p 1130 N94-17554
ALTITUDE TESTS
Effects of RVP, T(50), and oxygenates on hot-start and driveability performance at high and low altitude
[AD-A266382] p 869 N94-16516
ALUMINATES
Tritium diffusion and desorption in single crystal LiAlO2
[DE93-015140] p 1211 N94-16805
ALUMINIDES
Environmental embrittlement in ordered intermetallic alloys
[DE93-015307] p 955 N94-15830
Recent advances in ordered intermetallics
[DE93-015308] p 955 N94-15862
Environmental effects on iron aluminides
[DE93-015820] p 958 N94-16166
Interfacial shear behavior and its influence on fiber damage in sapphire-reinforced gamma titanium aluminide composites
[AD-A267943] p 1060 N94-17043
ALUMINUM
Characterization of the cyclic plasticity of polycrystalline aluminum in the 90-300K domain: Use of the ultrasonic wave coupling technique - low frequency restraint
[ISAL-92-0083] p 954 N94-14930
The corrosion protection of metals by ion vapor deposited aluminum
[NASA-TM-108425] p 955 N94-15832
Mean strain effects on the strain life fatigue curve
[AD-A267211] p 960 N94-16984
J-integral and HRR field associated with stable crack growth in thin aluminum SEN specimen
[AD-A267879] p 960 N94-17041
ALUMINUM ALLOYS
XPS analysis of Al/EPDM bondlines from IUS SRM-1 polar bosses
[AD-A266851] p 1056 N94-14945
Crack-tip-opening angle measurements and crack tunneling under stable tearing in thin sheet 2024-T3 aluminum alloy
[NASA-CR-191523] p 931 N94-15184
Prediction of stable tearing of 2024-T3 aluminum alloy using the crack-tip opening angle approach
[NASA-TM-109023] p 955 N94-15708
The corrosion protection of metals by ion vapor deposited aluminum
[NASA-TM-108425] p 955 N94-15832
Assessment of chromate and non-chromate conversion coatings for Al alloys using electrochemical impedance spectroscopy
[AD-A267205] p 965 N94-15859
Ternary alloying effects in polycrystalline (beta)-NiAl
[DE93-012675] p 955 N94-15885
Measurement and analysis of critical CTOA for an aluminum alloy sheet
[NASA-TM-109024] p 956 N94-15948
A reexamination of grain boundary fracture in Ni3Al: Environmental and alloying effects
[DE93-015431] p 1208 N94-16063
Environmental effects on iron aluminides
[DE93-015820] p 958 N94-16166
The effect of irradiation on the mechanical properties of 6061-T651 aluminum
[DE93-015825] p 958 N94-16168
Metastable phases in mechanically alloyed aluminum germanium powders
[DE93-008727] p 958 N94-16463
Bulk and defect properties of ordered intermetallics: A first-principles total-energy investigation
[DE93-015492] p 959 N94-16873
Fatigue life program using strain-life methods
[AD-A267310] p 1060 N94-16943
Mean strain effects on the strain life fatigue curve
[AD-A267211] p 960 N94-16984
J-integral and HRR field associated with stable crack growth in thin aluminum SEN specimen
[AD-A267879] p 960 N94-17041
Analysis of the strengthening of aluminum alloy undergoing plastic deformation under conditions of a compound state of stress
[IFTR-21/1991] p 960 N94-17093
Quantitative assessment of the accuracy of constitutive laws for plasticity with an emphasis on cyclic deformation
[AD-A267562] p 961 N94-17109
The effect of electric discharge machined notches on the fracture toughness of several structural alloys
[AD-A268605] p 962 N94-17464
ALUMINUM COATINGS
Improved composite flexible blanket insulation
[NASA-CASE-ARC-11955-1-CU] p 934 N94-15926
Formation of pitting resistant anodized films on aluminum
[AD-D015812] p 958 N94-16486
ALUMINUM COMPOUNDS
Lattice-mismatched In(0.40)Al(0.60)As window layers for indium phosphide solar cells
[NASA-TM-106255] p 1013 N94-17113
ALUMINUM FLUORIDES
An improved light source for laser ranging p 913 N94-15567
ALUMINUM GALLIUM ARSENIDE LASERS
Development of the Mars Observer Laser Altimeter (MOLA) p 921 N94-15617
ALUMINUM GALLIUM ARSENIDES
Large signal characterization and modeling of heterojunction bipolar transistors
[AD-A266184] p 1012 N94-16935
Curved grating fabrication techniques for concentric-circle grating, surface-emitting semiconductor lasers p 1045 N94-17349
Rare earth doped III-V semiconductors for optoelectronics
[AD-A268279] p 1216 N94-17577
Nonintrusive fast response oxygen monitoring system for high temperature flows
[NASA-CR-4553] p 1036 N94-17655
ALUMINUM ISOTOPES
Petrography, mineralogy, and Mg isotope composition of VICTA: A vigarano CaAl4O7-bearing type A inclusion p 1103 N94-16203
Heliocentric zoning of the asteroid belt by aluminum-26 heating p 1241 N94-16205
Al-26 production profile and model comparisons in Canyon Diablo p 1245 N94-16409
ALUMINUM NITRIDES
Laser assisted CVD growth of AlN and GaN
[AD-A267150] p 1206 N94-15764
Amide and tetrazene complexes of transition and main group elements as precursors for the low temperature synthesis of elemental nitrides
[AD-A266246] p 950 N94-16931
An alternative approach to the growth of single crystal gallium nitride
[AD-A267876] p 1213 N94-17037
ALUMINUM OXIDES
Ion mixing of thin ZrO2 films on sapphire
[DE93-015214] p 1206 N94-14925
Method of producing a silicon carbide fiber reinforced strontium aluminosilicate glass-ceramic matrix composite
[NASA-CASE-LEW-15263-2] p 934 N94-15929
Rheology and microstructure of concentrated zirconia-alumina suspensions for gelcasting composites
[DE93-015339] p 966 N94-16016
Thin composite solid electrolyte film for lithium batteries
[NASA-CASE-NPO-18694-1-CU] p 1014 N94-17325
Direct observation of fracture of CAS-glass/SiC composites and processing of toughened alumina
[AD-A268275] p 941 N94-17457
Growth of dielectric thin films by irradiation of condensed molecular precursors with synchrotron radiation
[DE93-016161] p 974 N94-17676
ALUMINUM SILICATES
Preparation of homogeneous aluminosilicate gels by sol/gel techniques
[AD-A266823] p 962 N94-14914
Multinuclear NMR study of aluminosilicate sol-gel synthesis reasons for the homogeneous gelation using the prehydrolysis method
[AD-A266877] p 962 N94-14921
ALUMINUM-LITHIUM ALLOYS
Aluminum-lithium technology
[TABES PAPER 93-601] p 962 N94-16137
AMBIENT TEMPERATURE
Diamond p-n junction cold cathode
[AD-A266926] p 1206 N94-15107
In situ Raman spectroscopy of lithium electrode surface in ambient temperature lithium secondary battery
[DE93-015238] p 1010 N94-16061
AMERICAN INDIANS
Ancient skills: Modern use
[NASA-TM-109594] p 1135 N94-15286

AMIDES
Amide and tetrazene complexes of transition and main group elements as precursors for the low temperature synthesis of elemental nitrides
[AD-A266246] p 950 N94-16931
Responsive copolymers for enhanced petroleum recovery
[DE93-018030] p 971 N94-16999
AMINO ACIDS
Study of protein-H2O interactions by multidimensional NMR spectroscopy
[AD-A266955] p 946 N94-15760
Heat shock protein induction in human cells by CO2 laser irradiation
[AD-A266430] p 1117 N94-16545
Hemoglobin
[AD-A266455] p 1123 N94-16566
AMMONIA
Rheology of water and ammonia-water ices p 953 N94-16188
Gravity dependent condensation pressure drop and heat transfer in ammonia two-phase heat transport systems
[NLR-TP-92121-U] p 1031 N94-17615
Growth of dielectric thin films by irradiation of condensed molecular precursors with synchrotron radiation
[DE93-016161] p 974 N94-17676
AMMONIUM COMPOUNDS
The effect of process parameters on the surface finish of plasma polymers
[DE93-014112] p 966 N94-15924
AMMONIUM PERCHLORATES
Investigation of the origin of hot spots in deformed crystals: Ammonium perchlorate studies
[AD-A267692] p 1214 N94-17270
AMMONIUM PHOSPHATES
Mechanical properties of magnesium ammonium phosphate cements and their zeolite composites
[DE93-015155] p 934 N94-16057
AMORPHOUS MATERIALS
Application of cylindrical distribution functions to anisotropic scattering from amorphous films
[DE93-015256] p 1183 N94-16811
Anisotropic phase separation in amorphous Fe-Ge alloys
[DE93-015255] p 961 N94-17251
AMORPHOUS SILICON
Thin Ni silicide formation by low temperature-induced metal atom reaction with ion implanted amorphous silicon
[DE93-015449] p 1209 N94-16066
AMPLIFICATION
Antenna gain loss and pattern degradation due to transmission through dielectric radomes
[AD-A267242] p 986 N94-14974
AMPLITUDES
Synchronous sampling phase and amplitude detection method and apparatus
[NASA-CASE-LAR-14725-1] p 1050 N94-15870
AMPOULES
Thermal spray forming of refractory sample ampoule cartridges for single crystal growth space furnaces
[TABES PAPER 93-605] p 1051 N94-16141
ANALOG CIRCUITS
Stray insensitive switched capacitor composite operational amplifiers
[AD-A267412] p 1012 N94-16976
ANALOG DATA
Freedom system Text and Graphics Systems (TAGS)
[NASA-TM-109509] p 1140 N94-15455
Simultaneous measurement of temperature and strain using four connecting wires
[NASA-TM-104271] p 1032 N94-15754
Evaluation of midband analog fiber optic telemetry links
[DE93-015128] p 883 N94-16056
Leak detection utilizing analog binaural (VLSI) techniques
[NASA-CASE-NPO-18399-1-CU] p 1014 N94-17323
ANALOG TO DIGITAL CONVERTERS
Two color satellite laser ranging upgrades at Goddard's 1.2m telescope facility p 915 N94-15581
Linear encoding device
[NASA-CASE-GSC-13562-1] p 1147 N94-15703
Rotary encoding device
[NASA-CASE-GSC-13543-1] p 1189 N94-15705
Rotary encoding device
[NASA-CASE-GSC-13556-1] p 1148 N94-15943
Image accuracy and representational enhancement through low-level, multi-sensor integration techniques
[DE93-014888] p 1167 N94-17287
ANALOGS
Mars Analog Site Study (MASS) p 1252 N94-16200
ANALYSIS OF VARIANCE
Simulation reduction using the Taguchi method
[NASA-CR-4542] p 1055 N94-17082
ANALYZERS
Prototype instrumentation and design studies
[AD-A266402] p 882 N94-16530
Electron reversal ionizer for detection of trace species using a spherical cathode
[NASA-CASE-NPO-18870-1-CU] p 1185 N94-17329
ANATOMY
Localizing visual function in the brain
[AD-A267381] p 1133 N94-17020
ANDES MOUNTAINS (SOUTH AMERICA)
Earth imaging results from Galileo's second encounter p 1252 N94-16201
ANGLE OF ATTACK
The effect of the nose shape and wing location toward the wing vortex breakdown
[AD-A267724] p 855 N94-14942
Wind tunnel investigation of three axisymmetric cowls of different lengths at Mach numbers from 0.60 to 0.92
[NASA-TM-4488] p 856 N94-15681
Particle simulation of hypersonic flow
[AD-A267185] p 857 N94-15787
Wind tunnel investigation with an operational turbojet engine
[TABES PAPER 93-662] p 870 N94-16157
Flow analysis for the nacelle of an advanced ducted propeller at high angle-of-attack and at cruise with boundary layer control
[NASA-TM-106371] p 858 N94-16571
An experimental study of fluctuating wall pressures in a highly swept, sharp fin-induced, Mach 5 shock wave/turbulent boundary layer interaction
[AD-A268394] p 861 N94-17461
ANGLES (GEOMETRY)
Measurements of the radar cross section and Inverse Synthetic Aperture Radar (ISAR) images of a Piper Navajo at 9.5 GHz and 49 GHz
[AD-A267570] p 1002 N94-17110
Review of rigorous coupled-wave analysis and of homogeneous effective medium approximations for high spatial-frequency surface-relief gratings p 1194 N94-17335
ANGULAR DISTRIBUTION
Past, present and future ((pi),(eta)) experiments
[DE93-016631] p 1182 N94-16115
The influence of an electric field on the kinetics of nucleation
[IFTR-2/91] p 1213 N94-17046
SYNMOD: A low-resource, low-cost means of monitoring the near-Earth space debris environment p 891 N94-17148
ANGULAR MOMENTUM
Numerical simulation of three-dimensional self-gravitating flow
[NASA-TM-109021] p 1021 N94-15768
ANGULAR RESOLUTION
Tip-tilt compensation: Resolution limits for ground-based telescopes using laser guide star adaptive optics
[DE93-016426] p 1237 N94-16872
ANGULAR VELOCITY
Determination of momentum flux using a bivane and cup anemometer
[AD-A265414] p 1105 N94-15137
ANHYDRIDES
Compounds containing meta-biphenylenedioxy moieties and polymers therefrom
[NASA-CASE-LAR-14517-1] p 965 N94-15879
Low dielectric polyimides
[NASA-CASE-LAR-14987-2] p 974 N94-17559
ANILINE
Soluble precursor route to polyanilines
[AD-A268015] p 973 N94-17494
ANIMALS
A review of the efficacy of 7.5 percent NaCl/6 percent Dextran-70 (HSD) in experimental animals and humans
[AD-A266633] p 1122 N94-15740
The 1990-1991 NASA space biology accomplishments
[NASA-TM-4501] p 1118 N94-17257
ANIONS
Thermochemistry of silicate speciation in aqueous sodium silicate solutions: Ionization and polymerization of small silicate ion
[AD-A266825] p 964 N94-15683
Swelling equilibria for temperature-sensitive ampholytic hydrogels
[DE93-015264] p 966 N94-15996
Scintillation mechanism in stoichiometric cerium compounds
[DE93-015499] p 948 N94-16771
ANISOTROPIC MEDIA
Measurement of birefringence for optical recording disk substrates p 1227 N94-14989
Dynamic behavior of fiber and particle reinforced composites
[AD-A266905] p 930 N94-15143
ANISOTROPIC PLATES
Three-dimensional analysis of anisotropic spatially reinforced structures p 939 N94-16863
ANISOTROPY
Magnetic and magneto-optical properties and domain structure of Co/Pd multilayers p 1227 N94-14991
Magnetic effects in anomalous dispersion
[DE93-014291] p 1175 N94-15978
Anisotropic damage mechanics modeling in metal matrix composites
[AD-A266328] p 934 N94-16440
Application of cylindrical distribution functions to anisotropic scattering from amorphous films
[DE93-015256] p 1183 N94-16811
Anisotropic phase separation in amorphous Fe-Ge alloys
[DE93-015255] p 961 N94-17251
Advanced thin-film deposition and physical properties of high-temperature and other novel superconducting materials
[AD-A268199] p 1216 N94-17561
ANNEALING
The thermal dissociation of NH2CHO(ND2CHO) on Si(100)-2x1
[AD-A266903] p 942 N94-14956
Infrared detector annealing and calibration with IR-laser diodes p 909 N94-15092
Optical and infrared spectra of thermally annealed Pb implanted SiO2 glasses
[DE93-015304] p 965 N94-15828
Thin Ni silicide formation by low temperature-induced metal atom reaction with ion implanted amorphous silicon
[DE93-015449] p 1209 N94-16066
Crystallization of grain boundary phases in silicon nitride with low additive contents by microwave annealing
[DE93-015801] p 1209 N94-16164
The effect of oxygen, grain size, and strain rate on the mechanical behavior of forged P/M tantalum
[DE93-011251] p 959 N94-16764
Tritium diffusion and desorption in single crystal LiAlO2
[DE93-015140] p 1211 N94-16805
Transient phenomena following precipitation and re-solution anneals in a NiTi alloy
[AD-A267557] p 961 N94-17106
ANNIHILATION REACTIONS
Status of (alpha)(sub s) measurements
[DE93-015179] p 1181 N94-16059
ANNUAL VARIATIONS
Atlas of TOMS ozone, 1978-1988
[NASA-TM-109456] p 1094 N94-15329
Validation and analysis of microwave-derived rainfall over the tropics
[AD-A267785] p 1108 N94-17303
ANNULAR FLOW
Heat transfer and aerodynamics of a 3D design nozzle guide vane tested in the Pyestock isentropic light piston facility
[RAE-TM-AERO/PROP-19] p 856 N94-15696
ANODES
Fabrication of advanced design (grooved) cermet anodes
[DE93-014590] p 1012 N94-16765
Investigation of onset of plasma formation at anode of fast-pulsed high-voltage vacuum diode
[AD-A267214] p 1204 N94-16987
ANODIC COATINGS
Formation of pitting resistant anodized films on aluminum
[AD-D015812] p 958 N94-16486
ANODIZING
The corrosion protection of metals by ion vapor deposited aluminum
[NASA-TM-108425] p 955 N94-15832
Formation of pitting resistant anodized films on aluminum
[AD-D015812] p 958 N94-16486
ANOMALIES
Cretaceous-tertiary boundary spherules and Cenozoic microtektites: Similarities and differences p 1241 N94-16186
ANORTHOSITE
Remote sensing studies of the northeastern portion of the lunar nearside p 1258 N94-16225
The monzonorite-anorthosite connection: The petrogenesis of terrestrial KREEP p 1104 N94-16365
ANTARCTIC OCEAN
Exploring the southern ocean response to climate change
[NASA-CR-194601] p 1112 N94-15680
Arctic and Antarctic sea ice, 1978-1987: Satellite passive-microwave observations and analysis
[NASA-SP-511] p 1114 N94-17439

ANTARCTIC REGIONS
Mars look-alike
[NASA-TM-109667] p 1094 N94-15238
Exploring the southern ocean response to climate change
[NASA-CR-194601] p 1112 N94-15680
Noble gases in twenty Yamato H-chondrites: Comparison with Allan Hills chondrites and modern falls p 1244 N94-16361
Atmospheric ionization by solar particles detected by nitrate measurement in antarctic snow
[AD-A267583] p 1299 N94-17208

ANTENNA ARRAYS
Velocity matched millimeterwave electro-optic modulator
[AD-A267264] p 1188 N94-14957
Adaptive beamforming with imperfect arrays: Pattern effects and their partial correction
[AD-A267079] p 987 N94-15541
Dual polarization microstrip array antenna
[CA-PATENT-1-307-842] p 994 N94-15986
Phased array antenna analysis using hybrid finite element methods
[AD-A267620] p 1002 N94-17196
Proceedings of the 1992 Antenna Applications Symposium, volume 1
[AD-A268167] p 1005 N94-17431

ANTENNA COMPONENTS
Velocity matched millimeterwave electro-optic modulator
[AD-A267264] p 1188 N94-14957

ANTENNA DESIGN
Advanced antennas for SAR spacecraft p 993 N94-15912
Dual polarization microstrip array antenna
[CA-PATENT-1-307-842] p 994 N94-15986
Manufacturing tolerance requirements for frequency selective surfaces
[AD-A266541] p 999 N94-16797
Design of broadband wire antennas for frequency hopping applications
[AD-A267405] p 1001 N94-17025
Proceedings of the 1992 Antenna Applications Symposium, volume 1
[AD-A268167] p 1005 N94-17431
The analysis of low-profile, broadband, monopole, vehicle antennas and matching network synthesis
[AD-A268340] p 1006 N94-17582

ANTENNA RADIATION PATTERNS
Antenna gain loss and pattern degradation due to transmission through dielectric radomes
[AD-A267242] p 986 N94-14974
An optically modulated scatterer for microwave antenna metrology
[NPL-DES-126] p 986 N94-15020
Adaptive beamforming with imperfect arrays: Pattern effects and their partial correction
[AD-A267079] p 987 N94-15541
Experimental evaluation of an adaptive focusing algorithm for a microwave planar phased-array hyperthermia system at UCSF
[AD-A267004] p 1121 N94-15634
Propagation-related AMT design aspects and supporting experiments p 995 N94-16042
Manufacturing tolerance requirements for frequency selective surfaces
[AD-A266541] p 999 N94-16797
Design of broadband wire antennas for frequency hopping applications
[AD-A267405] p 1001 N94-17025
How to deduce the far field of an antenna from planar near-field measurements
[NPL-DES-123] p 1006 N94-17545

ANTENNAS
Antenna gain loss and pattern degradation due to transmission through dielectric radomes
[AD-A267242] p 986 N94-14974

ANTIMISSILE DEFENSE
Hypervelocity orbital intercept guidance using certainty control
[AD-A267297] p 1174 N94-17219

ANTIMONY
BIB photodetectors based on antimony doped silicon p 902 N94-15047

ANTIMONY COMPOUNDS
Characterization of InTISb grown by low pressure metalorganic chemical vapor deposition on GaAs substrate
[AD-A266878] p 1206 N94-14922

ANTIPARTICLES
On the nature of mirror particles
[DE93-626670] p 1179 N94-14934

ANTIPROTONS
Search for the top quark from (e(mu)) and (e,e) events in the D0 detector in p(bar-p) collisions at the square root of s = 1.8 TeV
[DE93-016350] p 1186 N94-17662

ANTIREFLECTION COATINGS
Review of rigorous coupled-wave analysis and of homogeneous effective medium approximations for high spatial-frequency surface-relief gratings p 1194 N94-17335
Subwavelength structured surfaces and their applications p 1194 N94-17337
A new method of designing multilayer optical thin film coatings
[DE93-624683] p 974 N94-17611

ANXIETY
Scuba-diving, anxiety and task performance p 1132 N94-15938

APERTURES
Display system employing acousto-optic tunable filter
[NASA-CASE-NPO-18736-1-CU] p 1190 N94-15933
Design, development and characterization studies of a large aperture high power Nd: Glass rod amplifier stage
[DE93-624944] p 1042 N94-17630

APOLLO PROJECT
The 1966 highlights --- NASA research programs
[NASA-TM-109444] p 1302 N94-15343
Apollo presentation for Astrodome
[NASA-TM-109535] p 1302 N94-15366
President Kennedy's speech at Rice University
[NASA-TM-109532] p 1302 N94-15394
Galileo photometry of Apollo landing sites p 1259 N94-16234

APOLLO SOYUZ TEST PROJECT
ASTP 15th anniversary clip-media release
[NASA-TM-109534] p 1302 N94-15399

APPALACHIAN MOUNTAINS (NORTH AMERICA)
Mesoscale frontogenesis: An analysis of two cold front case studies
[AD-A267950] p 1107 N94-17054

APPLICATION SPECIFIC INTEGRATED CIRCUITS
Smart Power: New power integrated circuit technologies and their applications
[VTT-TIED-1358] p 1015 N94-17546

APPLICATIONS PROGRAMS (COMPUTERS)
HyperVentilate: Decision-support software for soil vapor extraction technology application
[PB93-134880] p 1094 N94-15136
An expert system shell for inferring vegetation characteristics: Atmospheric techniques (Task G)
[NASA-CR-194570] p 1082 N94-15531
SATCOP mission planning software package p 912 N94-15562
Preliminary analysis and design optimization of the short spacer truss of Space Station Freedom
[NASA-TM-4470] p 1058 N94-15709
A study of land mobile satellite service multipath effects using SATLAB software p 997 N94-16051
Proteus three-dimensional Navier-Stokes computer code, version 1.0. Volume 1: Analysis description
[NASA-TM-106337] p 1024 N94-16527
The Spectral Image Processing System (SIPS): Software for integrated analysis of AVIRIS data p 1067 N94-16674
Radar Analysis and Visualization Environment (RAVEN): Software for polarimetric radar analysis p 1080 N94-16758
ASTROS enhancements. Volume 1: ASTRO user's manual
[AD-A266818] p 1151 N94-16768
ASTROS enhancements. Volume 2: ASTRO programmer's manual
[AD-A266819] p 1151 N94-16769
Module interconnection frameworks for a real-time spreadsheet
[AD-A267752] p 1153 N94-17231

APPROACH
Category (CAT) 3B level 1 test plan for Global Positioning System (GPS)
[DOT/FAA/RD-93/21] p 864 N94-16835

APPROACH CONTROL
Wide-area Differential Global Positioning System (WDGPS)/Wide-area Integrity Broadcast (WIB) alternatives analysis
[DOT/FAA/SE-93/3] p 864 N94-16906
Hypervelocity orbital intercept guidance using certainty control
[AD-A267297] p 1174 N94-17219

APPROXIMATION
Monotone approximate query processing
[AD-A267153] p 1169 N94-15779
On the stability analysis of approximate factorization methods for 3D Euler and Navier-Stokes equations
[NASA-TM-106314] p 1169 N94-15818
Moments in statistics: Approximations to densities and goodness-of-fit
[AD-A266600] p 1173 N94-16726
Numerically solving a transient heat conduction problem with convection and radiation
[AD-A268521] p 1220 N94-17540
Steepest descent approximations for accretive operator equations
[DE93-628586] p 1171 N94-17667

AQUEOUS SOLUTIONS
Pressures of supercritical salt solutions p 945 N94-15166
Thermochemistry of silicate speciation in aqueous sodium silicate solutions: Ionization and polymerization of small silicate ion
[AD-A266825] p 964 N94-15683
Swelling equilibria for temperature-sensitive ampholytic hydrogels
[DE93-015264] p 966 N94-15996
Contained liquids in microgravity, part 2 p 979 N94-16085
Rheology of water and ammonia-water ices p 953 N94-16188
An investigation of the hydrolytic resistance of sodium-calcium plate glass with a layer of silica deposited on its surface
[IFTR-34/1991] p 971 N94-17120

AQUIFERS
Water-levels fluctuations in a borehole at the Royal Observatory of Belgium: Effects on local gravity, Earth tidal, and barometric responses p 1100 N94-15812
The seismic response of an aquifer to the propagation of an impact generated shock wave: A possible trigger of the Martian outflow channels? p 1281 N94-16354

ARAMID FIBER COMPOSITES
The effect of plasma treatment on interfacial bond characteristics of Kevlar/epoxy laminates as measured by T-peel tests
[AD-A266920] p 930 N94-14999
New textile composite materials development, production, application p 938 N94-16853

ARC DISCHARGES
Dynamic behavior of an electric arc gas discharge
[DE93-630197] p 1205 N94-17635

ARC WELDING
Adaptive weld control for high-integrity welding applications
[TABES PAPER 93-604] p 1049 N94-16140

ARCHITECTURE (COMPUTERS)
Video applications development platform
[AD-A266966] p 1163 N94-14953
The application of compiler-assisted multiple instruction retry to VLIW architectures
[AD-A266930] p 1158 N94-15173
Relaxing consistency in recoverable distributed shared memory
[AD-A266931] p 1140 N94-15174
Software architecture for shared information systems
[AD-A266995] p 1144 N94-15216
Overview of Enhanced Data Stream Array Processor (EDSAP)
[AD-A266986] p 1158 N94-15492
System architecture of optically controlled phased array radar
[AD-A267056] p 988 N94-15667
Integrated trusted systems development environment
[AD-A267029] p 1146 N94-15674
Architectures for software systems: A curriculum development proposal in undergraduate software engineering
[AD-A266703] p 1147 N94-15728
Department of Defense technical architecture framework for information management. Volume 2: Technical reference model and standards profile, version 2.0
[AD-A267194] p 1229 N94-15788
A decision criteria to select an associative-memory organization that minimizes the execution time of a mix of associative-search operations
[AD-A266438] p 1149 N94-16560
Disconnected operation in a distributed file system
[AD-A266461] p 1231 N94-16570
Efficient compilation of array statements for private memory multicomputers
[AD-A266595] p 1160 N94-16724
ASTROS enhancements. Volume 1: ASTRO user's manual
[AD-A266818] p 1151 N94-16768
ASTROS enhancements. Volume 2: ASTRO programmer's manual
[AD-A266819] p 1151 N94-16769
A modular control architecture for real-time synchronous and asynchronous systems
[DE93-015439] p 1166 N94-16888
Development of dynamic, contex-driven help systems
[AD-A267409] p 1152 N94-16974

A security architecture for fault-tolerant systems
[AD-A266178] p 1152 N94-16982
An object-oriented program specification for a mobile robot motion control language
[AD-A267213] p 1166 N94-16986
Fault-tolerant architectures for multiprocessor and VLSI-based systems
[AD-A267370] p 1140 N94-17005
Efficient scheduling of real-time compute-intensive periodic graphs on large grain data flow multiprocessor
[AD-A267444] p 1141 N94-17030
Networked workstations and parallel processing utilizing functional languages
[AD-A267464] p 1160 N94-17034
A proposed ground segment design for small satellites
p 878 N94-17154
Integrating reactive and deliberative planning for agents
[AD-A267631] p 1166 N94-17201
Light-weight process groups in the ISIS system
[NASA-CR-194544] p 1161 N94-17239
Computer-aided design package for designers of digital optical computers
[AD-A267866] p 1154 N94-17390
Integration of several computer systems within a heterogeneous environment
[AD-A267978] p 1155 N94-17500
Femtosecond carrier processes in compound semiconductors and real time signal processing
[AD-A268122] p 1005 N94-17519

ARCTIC OCEAN
Sea ice motions in the central arctic ice central arctic pack ice as inferred from AVHRR imagery
[NASA-CR-194572] p 1112 N94-15701
Arctic and Antarctic sea ice, 1978-1987: Satellite passive-microwave observations and analysis
[NASA-SP-511] p 1114 N94-17439

ARCTIC REGIONS
Arctic internal waves (CEAREX)
[AD-A265822] p 1111 N94-15139
Arctic ozone
[NASA-TM-109614] p 1095 N94-15365
Arctic cyclones and Marginal Ice Zone (MIZ) variability
[AD-A268610] p 1108 N94-17465

ARGENTINA
Martian crater degradation by eolian processes: Analogy with the Rio Cuarto Crater Field, Argentina
p 1251 N94-16196

ARGON
Investigation of the energy distribution of ions, striking the cathode in an abnormal glow discharge
[DE93-623987] p 1013 N94-17316
Laser ignition of solid propellants: 1. Ignition delays
[AD-A268454] p 976 N94-17538

ARGON ISOTOPES
The SCR Ne-21 and Ar-38 in lunar rock 68815: The solar proton energy spectrum over the past 2 MYR
p 1248 N94-16177
Preliminary Ar-40/Ar-39 age spectrum and laser probe dating of the M1 core of the Manson Impact Structure, Iowa: A K-T boundary crater candidate
p 1104 N94-16334
Effects of bulk composition on production rates of cosmogenic nuclides in meteorites p 1245 N94-16385
Solar noble gases revealed by closed system stepped etching of a metal separate from Fayetteville
p 954 N94-16432

ARGON LASERS
Photo-assisted epitaxial growth for III-V semiconductors
[AD-A267889] p 1213 N94-17042
Atomic beam studies relevant to the space environment
[AD-A268628] p 1186 N94-17436

ARIANE LAUNCH VEHICLE
ARIANE 5 light derivatives p 878 N94-17140

ARID LANDS
AVIRIS study of Death Valley evaporite deposits using least-squares band-fitting methods p 1067 N94-16676
Discrimination among semi-arid landscape endmembers using the Spectral Angle Mapper (SAM) algorithm
p 1074 N94-16711

ARITHMETIC
Operator overloading as an enabling technology for automatic differentiation
[DE93-012899] p 1170 N94-16778

ARKANSAS
Ground wave emergency network final operational capability. Environmental assessment for southern Arkansas relay node site no. RN 8C912AR
[AD-A268001] p 1004 N94-17376

ARMATURES
Integrated fundamental research on current collection
[AD-A266987] p 1008 N94-15494
Numerical modeling of the temperature gradients and spectra of the plasma armature on Thunderbolt
[AD-A266414] p 878 N94-16552

ARMED FORCES (UNITED STATES)
Monograph of the aviation epidemiology data register for FY 1991
[AD-A266896] p 1119 N94-14952
AFOSR technical report summaries, January - March 1993
[AD-A267187] p 1230 N94-15850

ARMOR
Dynamic testing and characterization of pre-fractured ceramic
[DE93-016457] p 972 N94-17238

ARPA COMPUTER NETWORK
A geological and geophysical information system for Eurasia
[AD-A267841] p 1232 N94-17036
ARPA unmanned ground vehicle stereo vision program at Teleos Research
[AD-A267632] p 1167 N94-17202

ARRAYS
Broadband teleseismic array recording in the Adirondack Mountains, New York State
[AD-A267290] p 1097 N94-14960
CdTe array detectors for high energy astronomy
p 899 N94-15029
Large scientific 2-D arrays for the 1-5 micron region
p 902 N94-15044
Photoconductors and arrays for the far-infrared
p 902 N94-15045
Nonstationary behaviour of low background photon detectors p 902 N94-15049
Schottky barrier focal plane arrays for SWIR and MWIR p 903 N94-15050
Advanced high performance CdHgTe multiplexed arrays p 903 N94-15051
Lead chalcogenides based IR photosensitive array detectors with coordinate addressing
p 903 N94-15053
The alignment-distribution graph
[NASA-CR-194292] p 1168 N94-15112
Mobile and replicated alignment of arrays in data-parallel programs
[NASA-CR-194294] p 1158 N94-15113
Work at Graz on satellite signatures
p 898 N94-15558
Binary optics at Hughes Danbury Optical Systems
p 1195 N94-17344
Field-emitter arrays for RF vacuum microelectronics
[AD-A268397] p 1015 N94-17526

ARSENIC
Arsenic surveillance program p 1127 N94-16637
Activation and deactivation of high concentration arsenic with some evidence of precipitation
[DE93-016437] p 950 N94-16952
Photo-assisted epitaxial growth for III-V semiconductors
[AD-A267889] p 1213 N94-17042

ARTERIES
Laser artery repair
[NASA-TM-109604] p 1120 N94-15312
The nature of dynamic arteriolar vasoreactivity: A mini-review and A classification scheme
[AD-A266499] p 1128 N94-16783

ARTIFICIAL GRAVITY
Apparatus and method for producing an artificial gravitational field
[NASA-CASE-MSC-22021-1] p 886 N94-15935

ARTIFICIAL INTELLIGENCE
YARF: An open-ended framework for robot road following
[AD-A266788] p 1163 N94-14910
A scientific basis for computational science
[AD-A266697] p 1148 N94-15841
Proceedings of the Association for Computing Machinery Special Interest Group for Ada Artificial Intelligence Working Group
[AD-A266422] p 1165 N94-16559
Combinatorial semantics
[TR-444] p 1149 N94-16575
Temporal segmentation of tasks from human hand motion
[AD-A266596] p 1166 N94-16725
KBSA concept demo
[AD-A267054] p 1166 N94-16770
Information technology division technical paper abstracts
[AD-A266227] p 1166 N94-16938
Integrating reactive and deliberative planning for agents
[AD-A267631] p 1166 N94-17201
ARPA unmanned ground vehicle stereo vision program at Teleos Research
[AD-A267632] p 1167 N94-17202
Intelligent use of CFAR algorithms
[AD-A267755] p 1003 N94-17206
Developing automated analysis methods for sea ice imagery: A status report with recommendations
[AD-A267284] p 1113 N94-17241
Notes on the use of Dempster-Shafer and fuzzy reasoning to fuse identity attribute data
[AD-A267426] p 1004 N94-17309
Incremental rederivation of software artifacts: FY 1992
[AD-A267968] p 1155 N94-17491
A high-speed object recognition chip based on a biologically-realistic hybrid temporal processing
[AD-A268270] p 1134 N94-17576

ARTIFICIAL SATELLITES
Proceedings of the 1992 Antenna Applications Symposium, volume 2
[AD-A266916] p 986 N94-14998
Satellite situation report, volume 33, no. 3
[NASA-TM-109278] p 885 N94-15712
Solar absorptance of optical surfaces contaminated with spacecraft material outgassing products
[AD-A267202] p 886 N94-15857
History of on-orbit satellite fragmentations
[NASA-CR-191644] p 887 N94-16502
L-shell binning and display of sensor data from the CRRES spacecraft
[AD-A267256] p 888 N94-16990
Implementing a 50x50 gravity field model in an orbit determination system
[AD-A267548] p 888 N94-17103
Space systems environmental interaction studies
[AD-A267280] p 897 N94-17240
Satellite situation report, volume 31, number 1
[NASA-TM-105088] p 898 N94-17584

ASBESTOS
Asbestos Surveillance Program p 1127 N94-16638

ASCENT
STS-30 suited ascent training in fixed base SMS
[NASA-TM-109581] p 875 N94-15265
Assimilation of solids during ascent of magmas from the Bartoy Field of the Baikal Region, Siberia
p 1103 N94-16214

ASCENT TRAJECTORIES
Trajectory optimization for the National Aerospace Plane
[NASA-CR-194618] p 867 N94-16498

ASIA
The Karakul depression in Pamirs: The first impact structure in Central Asia p 1241 N94-16212
A geological and geophysical information system for Eurasia
[AD-A267841] p 1232 N94-17036

ASPHALT
User's guide: Hot-mix recycling of asphalt concrete pavements
[AD-A266939] p 983 N94-15177
An analysis of ways of determining the material constants for viscoelastic materials
[IFTR-28/91] p 951 N94-17050

ASPHERICITY
Binary optics at Hughes Danbury Optical Systems
p 1195 N94-17344
Fabrication techniques for very fast diffractive lenses
p 1196 N94-17345

ASSIMILATION
Assimilation of solids during ascent of magmas from the Bartoy Field of the Baikal Region, Siberia
p 1103 N94-16214

ASSOCIATIVE PROCESSING (COMPUTERS)
Unipolar terminal-attractor based neural associative memory with adaptive threshold
[NASA-CASE-NPO-18790-1-CU] p 1165 N94-15958

ASSURANCE
Software Engineering Guidebook
[NASA-CR-177625] p 1150 N94-16656

ASTEROID BELTS
Heliocentric zoning of the asteroid belt by aluminum-26 heating p 1241 N94-16205
Petrologic constraints on the surface processes on asteroid 4 Vesta and on excavation depths of diogenite fragments p 1241 N94-16208
An initial perspective of S-asteroid subtypes within asteroid families p 1243 N94-16310

ASTEROID MISSIONS
The Clementine instrument complement
p 1086 N94-16370
Small spacecraft for planetary exploration
p 874 N94-17145

ASTEROIDS
Twenty-Fourth Lunar and Planetary Science Conference. Part 2: G-M
[NASA-CR-193174] p 1247 N94-16173
Spectral evidence of size dependent space weathering processes on asteroid surfaces p 1241 N94-16174
New K type asteroids p 1241 N94-16195

Collisional and dynamical history of Gaspra
p 1241 N94-16202
Heliocentric zoning of the asteroid belt by aluminum-26 heating
p 1241 N94-16205
Comparison of reflectance spectra of C asteroids and unique C chondrites Y86720, Y82162, and B7904
p 1242 N94-16246
Iron oxide bands in the visible and near-infrared reflectance spectra of primitive asteroids
p 1242 N94-16274
Explosive volcanism and the compositions of the cores of differentiated asteroids
p 1243 N94-16306
An initial perspective of S-asteroid subtypes within asteroid families
p 1243 N94-16310
Cat Mountain: A meteoritic sample of an impact-melted chondritic asteroid
p 1244 N94-16328
Clementine: Anticipated scientific datasets from the Moon and Geographos
p 1288 N94-16392
Optical effects of regolith processes on S asteroids as simulated by laser impulse alteration of ordinary chondrite
p 1246 N94-16422

ASTRO MISSIONS (STS)
STS-35 onboard photography quick release
[NASA-TM-109500] p 881 N94-15464
STS-35 mission highlights resource tape
[NASA-TM-109501] p 881 N94-15465

ASTRODYNAMICS
Linear stability of stationary solutions of the Vlasov-Poisson system in three dimensions
[DE93-013873] p 1174 N94-16820

ASTRONAUT LOCOMOTION
STS-37 CETA evaluation with Ross
[NASA-TM-109495] p 1135 N94-15330

ASTRONAUT MANEUVERING EQUIPMENT
STS-37 CETA evaluation with Ross
[NASA-TM-109495] p 1135 N94-15330
STS-37 astronauts Ross and Apt during CETA hardware checkout
[NASA-TM-109496] p 1137 N94-15460

ASTRONAUT TRAINING
STS-35 crew training: EMU walk through and EVA prep and post
[NASA-TM-109488] p 1134 N94-15194
STS-35 Crew training: Bailout in CCT, firefighting, TAGS class and bailout in WFTF
[NASA-TM-109489] p 1135 N94-15195
Brown, Mark --- astronaut candidate training
[NASA-TM-109505] p 1135 N94-15224
Space Station Freedom
[NASA-TM-109636] p 1031 N94-15247
STS-30 suited ascent training in fixed base SMS
[NASA-TM-109581] p 875 N94-15265
STS-26 STA training (Hauck)
[NASA-TM-109555] p 870 N94-15279
The 61-M long duration sim video highlights resource tape
[NASA-TM-109569] p 875 N94-15299
STS-30 Magellan deploy Sim in SMS and MOCR
[NASA-TM-109571] p 875 N94-15301
STS-30 EVA prep in CCT: Grabe, Lee, and Thagard
[NASA-TM-109572] p 1135 N94-15303
STS-30 crew photo in building 4
[NASA-TM-109573] p 1031 N94-15304
STS-29 pre-launch and post-landing egress
[NASA-TM-109574] p 1135 N94-15305
Space adaptation
[NASA-TM-109601] p 1120 N94-15309
STS-32 IMAX camera training
[NASA-TM-109567] p 1031 N94-15316
STS-26 IUS and latch contingency training
[NASA-TM-109561] p 875 N94-15331
STS-26 generic integrated IUS deploy simulation
[NASA-TM-109562] p 875 N94-15332
STS-26 EVA rescue training
[NASA-TM-109563] p 875 N94-15333
STS-34 McCully and Baker during IFM training
[NASA-TM-109462] p 880 N94-15357
STS-34 crew bailout exercise in CCT
[NASA-TM-109465] p 1135 N94-15360
STS-34 Chang-Diaz and E. Baker during Galileo contingency training in WFTF
[NASA-TM-109466] p 1135 N94-15361
STS-29 IMAX camera audio class FFT
[NASA-TM-109543] p 1031 N94-15374
STS-32 LDEF EVA training in WETF with Low and Dunbar
[NASA-TM-109473] p 1135 N94-15377
STS-32 LDEF approach in SES
[NASA-TM-109474] p 880 N94-15379
STS-29 crew IMAX camera training
[NASA-TM-109546] p 1031 N94-15380
STS-32 crew training for lower body negative pressure unit and AFE
[NASA-TM-109475] p 1120 N94-15381
STS-32 bailout training in WETF
[NASA-TM-109476] p 1136 N94-15383
STS-29 crew bailout in WETF
[NASA-TM-109548] p 1136 N94-15385
STS-28 Adamson and Brown EMU walk through
[NASA-TM-109549] p 1136 N94-15387
STS-33 emergency egress training
[NASA-TM-109525] p 1136 N94-15388
1990 ASCAN land survival training
[NASA-TM-109527] p 1136 N94-15390
1990 ASCAN ground egress/parasail
[NASA-TM-109528] p 1136 N94-15391
ASTP 15th anniversary clip-media release
[NASA-TM-109534] p 1302 N94-15399
STS-27 EMU and RMS contingency training
[NASA-TM-109550] p 1136 N94-15401
STS-33 Carter and Thorton during WETF activities
[NASA-TM-109471] p 1136 N94-15402
STS-27 crew photo training and habitation procedures
[NASA-TM-109553] p 1032 N94-15405
STS-27 crew fire training and glove molding
[NASA-TM-109554] p 1136 N94-15406
STS-31 Hubble space telescope contingency training in WETF with McCandless and Sullivan
[NASA-TM-109480] p 1136 N94-15441
STS-31 Hubble space telescope deploy: Training at MDF with Hawley
[NASA-TM-109481] p 876 N94-15442
STS-31 HST deploy sim in SMS and MOCR
[NASA-TM-109482] p 876 N94-15449
STS-31 crew training inflight maintenance and bailout exercises in CCT and WFTF
[NASA-TM-109483] p 876 N94-15450
STS-31 crew training: firefighting, food tasting, EVA prep and post
[NASA-TM-109484] p 876 N94-15451
STS-38 crew training: Habitation equipment procedures, bailout in CCT, 70mm photo class, EVA prep and post, and firefighting
[NASA-TM-109494] p 1136 N94-15453
STS-36 crew EVA prep and post-training, bailout exercises, final bench review
[NASA-TM-109498] p 1137 N94-15462
STS-35 payload specialists Durrance and Parise: 70mm photo training and cabin familiarization
[NASA-TM-109499] p 1032 N94-15463
Richards, Dick: Training clip
[NASA-TM-109503] p 876 N94-15467
STS-27 crew deorbit prep in SMS with Gibson, Shepard, Mullane, Ross, and G. Gardner
[NASA-TM-109518] p 882 N94-15468
STS-26 long duration simulation: Crew entering SMS
[NASA-TM-109560] p 876 N94-15474
Astronauts number 1 --- mercury project
[NASA-TM-109428] p 1131 N94-15499
STS-41 crew training bailout in CCT, 16mm camera class EVA prep, habitation equipment procedures, and food tasting
[NASA-TM-109517] p 876 N94-15517
STS-31 crew Linof, Arriflex, and IMAX camera training
[NASA-TM-109485] p 1032 N94-15792

ASTRONAUTICS
Commonwealth of Independent States aerospace science and technology, 1992: A bibliography with indexes
[NASA-SP-7106] p 854 N94-16481

ASTRONAUTS
Brown, Mark --- astronaut candidate training
[NASA-TM-109505] p 1135 N94-15224
Teacher in space
[NASA-TM-109666] p 1131 N94-15237
STS-26 IUS and latch contingency training
[NASA-TM-109561] p 875 N94-15331
Living well in space: Ensuring crew capability
[NASA-TM-109538] p 1120 N94-15369
STS-29 mission highlights resource tape
[NASA-TM-109542] p 880 N94-15373
STS-29 IMAX camera audio class FFT
[NASA-TM-109543] p 1031 N94-15374
STS-29 EVA prep in FFT
[NASA-TM-109544] p 1135 N94-15375
STS-32 LDEF EVA training in WETF with Low and Dunbar
[NASA-TM-109473] p 1135 N94-15377
STS-32 crew training for lower body negative pressure unit and AFE
[NASA-TM-109475] p 1120 N94-15381
STS-28 Adamson and Brown EMU walk through
[NASA-TM-109549] p 1136 N94-15387
ASTP 15th anniversary clip-media release
[NASA-TM-109534] p 1302 N94-15399
STS-27 EMU and RMS contingency training
[NASA-TM-109550] p 1136 N94-15401
STS-33 Carter and Thorton during WETF activities
[NASA-TM-109471] p 1136 N94-15402
STS-27 crew post-insertion deorbit-prep in CCT
[NASA-TM-109552] p 1136 N94-15404
STS-26 missions highlight resource tape
[NASA-TM-109559] p 881 N94-15407
STS-36 crew presentation clip
[NASA-TM-109497] p 881 N94-15461
STS-35 payload specialists Durrance and Parise: 70mm photo training and cabin familiarization
[NASA-TM-109499] p 1032 N94-15463
STS-35 onboard photography quick release
[NASA-TM-109500] p 881 N94-15464
STS-35 mission highlights resource tape
[NASA-TM-109501] p 881 N94-15465
Science operation in space: Lessons
[NASA-TM-109502] p 881 N94-15466
Richards, Dick: Training clip
[NASA-TM-109503] p 876 N94-15467
STS-26 long duration simulation: Crew entering SMS
[NASA-TM-109560] p 876 N94-15474
Astronauts number 3 --- Friendship 7
[NASA-TM-109430] p 874 N94-15501
Exposure fluctuations of astronauts due to orientation
[NASA-TP-3364] p 1300 N94-15816

ASTRONOMICAL CATALOGS
Critically evaluated/distributed database of IRAS LRS spectra
[NASA-CR-193611] p 1232 N94-17038

ASTRONOMICAL MODELS
The physical mechanism of comet outbursts: An experiment
p 1242 N94-16221

ASTRONOMICAL OBSERVATORIES
Matera Laser Ranging Observatory (MLRO): An overview
p 877 N94-15601
TLRS-3 system upgrades
p 877 N94-15609

ASTRONOMICAL PHOTOMETRY
Heliocentric zoning of the asteroid belt by aluminum-26 heating
p 1241 N94-16205
Galileo photometry of Apollo landing sites
p 1259 N94-16234
Earth-based and Galileo SSI multispectral observations of eastern mare serenitatis and the Apollo 17 landing site
p 1261 N94-16244

ASTRONOMICAL SPECTROSCOPY
CdTe array detectors for high energy astronomy
p 899 N94-15029
Spectral evidence of size dependent space weathering processes on asteroid surfaces
p 1241 N94-16174
New K type asteroids
p 1241 N94-16195
Heliocentric zoning of the asteroid belt by aluminum-26 heating
p 1241 N94-16205
Earth-based and Galileo SSI multispectral observations of eastern mare serenitatis and the Apollo 17 landing site
p 1261 N94-16244
The spectrum of Phobos from Phobos 2 observations at 0.3-2.6 microns: Comparison to previous data and meteorite analogs
p 1295 N94-16429

ASTRONOMY
Large scientific 2-D arrays for the 1-5 micron region
p 902 N94-15044
Astronomy and astrophysics
p 1239 N94-15970
The planetary data system educational CD-ROM
p 1234 N94-16209
From the Moons of Jupiter to the Milky Way
[NASA-CR-194649] p 1240 N94-17059

ASTROPHYSICS
NASA's Ultraviolet Astrophysics Branch: Present and future detector program
p 910 N94-15102
Astronomy and astrophysics
p 1239 N94-15970
Particle physics and cosmology, Task C
[DE93-016865] p 1239 N94-16118
The Megascience Forum
[DE93-014445] p 1303 N94-16804
ALEXIS and HETE: Two small, low cost, scientific satellite systems
p 896 N94-17185

ASYMMETRY
Structural investigation of electrochemically etched silicon
[DE93-015300] p 1207 N94-15827
Analysis of temporal symmetry in non-gaussian random fields
[AD-A266496] p 999 N94-16794
Asymmetric three-beam binary optic grating
p 1195 N94-17340
High order nonlinear estimation with signal processing applications
[AD-A268407] p 1005 N94-17463

ASYMPTOTIC METHODS
Analysis of an electromagnetic field in the vicinity of a caustic by asymptotic methods
[IFTR-12/1991] p 998 N94-16653

ASYMPTOTIC PROPERTIES
Asymptotic behavior of firmly non expansive sequences
[DE93-628589] p 1171 N94-17642

ASYMPTOTIC SERIES
Highly transient elastodynamic crack growth in a bimaterial interface: Higher order asymptotic analysis and optical experiments
[AD-A266465] p 1059 N94-16587
Convection effects on radial segregation and crystal melt interface in vertical Bridgman growth
[NASA-CR-191541] p 1029 N94-17387
ATLANTIC OCEAN
Ray tracing on topographic Rossby waves
[AD-A267014] p 1112 N94-15844
Meridional circulation in the tropical north atlantic
[AD-A268222] p 1114 N94-17555
ATMOSPHERIC & OCEANOGRAPHIC INFORM SYS
Observations and modelling of winds and waves during the Surface Wave Dynamics Experiment. Report 1: Intensive observation period IOP-1, 20-31 October 1990
[AD-A266384] p 1113 N94-16517
ATMOSPHERIC ATTENUATION
Johnson-Gierhart program predictions of excess propagation loss for super-high frequency air-to-ground paths. Volume 2: Appendices
[AD-A267021] p 987 N94-15527
Johnson-Gierhart program predictions of excess propagation loss for super-high frequency air-to-ground paths. Volume 1: Theory and numerical results
[AD-A267105] p 988 N94-15649
Olympus propagation measurement results at Virginia Tech p 995 N94-16037
Data acquisition, preprocessing and analysis for the Virginia Tech OLYMPUS experiment p 995 N94-16038
A comparison of cloud attenuation models using measured cloud data p 996 N94-16044
Brightness temperature and attenuation statistics at 20.6 and 31.65 GHz p 996 N94-16045
Comparison of OLYMPUS beacon and radiometric attenuation measurements at Blacksburg, Virginia p 996 N94-16046
A CCIR-based prediction model for Earth-Space propagation p 997 N94-16050
Application of split window technique to TIMS data p 1064 N94-16601
The use of TIMS data to estimate the SO2 concentrations of volcanic plumes: A case study at Mount Etna, Sicily p 1065 N94-16608
Hyperspectral modeling for extracting aerosols from aircraft/satellite data p 1067 N94-16673
Software for the derivation of scaled surface reflectances from AVIRIS data p 1072 N94-16700
Atmospheric propagation analysis program
[AD-A268231] p 1006 N94-17565
ATMOSPHERIC BOUNDARY LAYER
Detecting surface roughness effects on the atmospheric boundary layer via AIRSAR data: A field experiment in Death Valley, California p 1078 N94-16747
An investigation of the Ground-Based High-Resolution Interferometer Sounder (GB-HIS) in a costal marine environment
[AD-A268052] p 1114 N94-17503
ATMOSPHERIC CHEMISTRY
Electronic spectroscopy of the gas-phase OH-Kr van der Waals complex
[AD-A266891] p 942 N94-14946
Mesoscale modeling of the atmosphere
[AD-A263236] p 1098 N94-15132
Projections of future CO2
[NIWA/ATMOS/R/93-001] p 1094 N94-15185
ATLAS-2 and UARS correlative measurement opportunities during Space Shuttle mission on April 8-17, 1993
[NASA-TM-109020] p 1105 N94-15480
Characterization of UV emissions resulting from electronic energy transfer in atmospheric molecules
[AD-A266244] p 1101 N94-16469
BACKSCAT lidar simulation version 3.0: Technical documentation and users guide
[AD-A267296] p 1003 N94-17268
ATMOSPHERIC CIRCULATION
Mesoscale modeling of the atmosphere
[AD-A263236] p 1098 N94-15132
A global traveling wave on Venus
[NASA-CR-194356] p 1246 N94-15182
IAI topic: El Nino. Southern oscillation and interannual climate variability
[INPE-5410-PRE/1757] p 1111 N94-15186
Effects of spatial variability and scale on areal -average evapotranspiration p 1084 N94-16033
Sand transport on Mars: Preliminary results from models p 1252 N94-16198
Dust-dynamic feedbacks in the Martian atmosphere: Surface dust lifting p 1296 N94-16434
Mesoscale frontogenesis: An analysis of two cold front case studies
[AD-A267950] p 1107 N94-17054
Orographic microbursts in a severe winter windstorm
[AD-A267651] p 1108 N94-17247
BACKSCAT lidar simulation version 3.0: Technical documentation and users guide
[AD-A267296] p 1003 N94-17268
A correlative comparison of geomagnetic storms and auroral substorms using geomagnetic indeces
[AD-A268081] p 1102 N94-17512
Propagation characteristics of mesoscale convective systems
[AD-A268130] p 1109 N94-17522
Further development and testing of a second-order bulk boundary layer model
[AD-A268071] p 1109 N94-17552
A two-layer quasi-geotrophic spherical model: Formulation and climatology
[DM-63] p 1110 N94-17593
ATMOSPHERIC COMPOSITION
Projections of future CO2
[NIWA/ATMOS/R/93-001] p 1094 N94-15185
Global Greenhouse Expedition
[NASA-TM-109613] p 1095 N94-15364
Preliminary analysis of University of North Dakota aircraft data from the FIRE Cirrus IFO-2
[NASA-CR-193357] p 866 N94-15429
Driving terrestrial ecosystem models from space p 991 N94-15896
Trapping of water vapor from an atmosphere by condensed silicate matter formed by high-temperature pulse vaporization p 1248 N94-16180
A Pluto thermal model p 1256 N94-16216
Martian carbon dioxide: Clues from isotopes in SNC meteorites p 1270 N94-16295
Evolution of Triton's volatile budget p 1284 N94-16373
Retrieval of biophysical parameters with AVIRIS and ISM: The Landes Forest, south west France p 1068 N94-16681
Investigation of cloud properties and atmospheric stability with MODIS
[NASA-CR-193475] p 1107 N94-16717
The use of General Circulation Models in detecting climate change induced by greenhouse gases
[DE93-014369] p 1096 N94-16802
The feasibility of tropospheric and total ozone determination using a Fabry-Perot interferometer as a satellite-based nadir-viewing atmospheric sensor
[NASA-TM-109342] p 1102 N94-17214
Second flight of the Spacelab grille spectrometer during the Atlas-1 mission
[AERONAUTICA-ACTA-A-367-199] p 923 N94-17592
ATMOSPHERIC CORRECTION
An expert system shell for inferring vegetation characteristics: Atmospheric techniques (Task G)
[NASA-CR-194570] p 1082 N94-15531
New methods of generation of ultrashort laser pulses for ranging p 913 N94-15565
New perspectives for high accuracy SLR with second gpneration geodesic satellites p 916 N94-15585
Test plan for the evaluation of the initial capability of the National Satellite Test Bed: Phase 1D
[DOT/FAA/RD-93/20] p 876 N94-16025
Application of split window technique to TIMS data p 1064 N94-16601
Atmospheric corrections for TIMS estimated emittance p 1064 N94-16602
Atmospheric correction of AVIRIS data in ocean waters p 1070 N94-16690
A comparison of LOWTRAN-7 corrected Airborne Visible/Infrared Imaging Spectrometer (AVIRIS) data with ground spectral measurements p 1074 N94-16710
ATMOSPHERIC DENSITY
BRIDGE: A small scientific satellite for geodesy p 890 N94-17146
ATMOSPHERIC EFFECTS
A ray trace model for propagation loss
[AD-A266314] p 997 N94-16467
The 1991 AVIRIS/POLDER experiment in Camargue, France p 1070 N94-16691
Aircraft carrier exposure tests of cast magnesium alloys
[AD-A268260] p 962 N94-17418
Forecasting the ducting of electromagnetic waves on the mesoscale
[AD-A268101] p 1109 N94-17571
ATMOSPHERIC ELECTRICITY
Remote sensing of precipitation and electrification with a dual-polarization, coherent, wideband radar system
[AD-A267479] p 1004 N94-17364
ATMOSPHERIC ENTRY
Size distribution of interplanetary iron and stony particles related with deep-sea spherules p 1245 N94-16388
ATMOSPHERIC GENERAL CIRCULATION MODELS
Exploring the southern ocean response to climate change
[NASA-CR-194601] p 1112 N94-15680
Evapotranspiration and runoff from large land areas: Land surface hydrology for atmospheric general circulation models p 1083 N94-16029
The use of General Circulation Models in detecting climate change induced by greenhouse gases
[DE93-014369] p 1096 N94-16802
Surface energy balance modeling at mesoscale: The contribution of the future Earth observing system
[BCRS-91-04] p 1085 N94-17616
Boundary layer structure over areas of heterogeneous heat fluxes
[DE93-010657] p 1110 N94-17673
ATMOSPHERIC HEATING
Some thoughts on future rain mapping missions (TRMM follow-on) p 992 N94-15906
ATMOSPHERIC MODELS
Engineering Physics and Mathematics Division progress report, period ending 31 December 1992
[DE93-015118] p 1301 N94-14926
Sensitivity testing of a single-Doppler temperature retrieval and forecast system
[AD-A267278] p 1105 N94-14958
Mesoscale modeling of the atmosphere
[AD-A263236] p 1098 N94-15132
Short term weather forecasting in real time in a base weather station setting
[AD-A266872] p 1105 N94-15142
IAI topic: El Nino. Southern oscillation and interannual climate variability
[INPE-5410-PRE/1757] p 1111 N94-15186
Atmospheric transmittance between 1.0 and 2.0 micrometers
[AD-A267076] p 1098 N94-15539
Comparison of RADARC high-frequency radar performance prediction model and ROTHR Amchitka data
[AD-A267077] p 987 N94-15540
Two color satellite laser ranging upgrades at Goddard's 1.2m telescope facility p 915 N94-15581
Two wavelength satellite laser ranging using SPAD p 916 N94-15584
State-of-the-art satellite laser range modeling for geodetic and oceanographic applications p 916 N94-15586
Investigate wave-mean flow interaction and transport in the extratropical winter stratosphere
[NASA-CR-194555] p 1098 N94-15639
Some thoughts on future rain mapping missions (TRMM follow-on) p 992 N94-15906
Global Energy and Water Cycle Experiment (GEWEX) and the Continental-scale International Project (GCIP) p 994 N94-15918
Evolutionary implications of a steady-state water abundance on Venus p 1254 N94-16206
A Pluto thermal model p 1256 N94-16216
Vertical structure models of the 1990 equatorial disturbance on Saturn p 1277 N94-16333
Observations and modelling of winds and waves during the Surface Wave Dynamics Experiment. Report 1: Intensive observation period IOP-1, 20-31 October 1990
[AD-A266384] p 1113 N94-16517
The multivariate optimum interpolation analysis of meteorological data at the Fleet Numerical Oceanography Center
[AD-A266459] p 1106 N94-16568
Hyperspectral modeling for extracting aerosols from aircraft/satellite data p 1067 N94-16673
Oregon transect: Comparison of leaf-level reflectance with canopy-level and modelled reflectance p 1073 N94-16702
Discrimination among semi-arid landscape endmembers using the Spectral Angle Mapper (SAM) algorithm p 1074 N94-16711
Mechanistic models of soot formation
[AD-A267806] p 950 N94-17008
On-board spatial scientific experiment project on small satellites p 896 N94-17184
Phillips Laboratory global spectral numerical weather prediction model
[AD-A267293] p 1107 N94-17244
Optimization of satellite coverage in observing cause and effect changes in the ionosphere, magnetosphere, and solar wind
[AD-A267956] p 1102 N94-17493
Further development and testing of a second-order bulk boundary layer model
[AD-A268071] p 1109 N94-17552
Forecasting the ducting of electromagnetic waves on the mesoscale
[AD-A268101] p 1109 N94-17571
A two-layer quasi-geotrophic spherical model: Formulation and climatology
[DM-63] p 1110 N94-17593
Workshop on early Mars: How warm and how wet, part 2?
[NASA-CR-193503] p 1297 N94-17637

Boundary layer structure over areas of heterogeneous heat fluxes
[DE93-010657] p 1110 N94-17673

ATMOSPHERIC MOISTURE
Trapping of water vapor from an atmosphere by condensed silicate matter formed by high-temperature pulse vaporization p 1248 N94-16180
Empirical relationships among atmospheric variables from rawinsonde and field data as surrogates for AVIRIS measurements: Estimation of regional land surface evapotranspiration p 1074 N94-16712
An investigation of the Ground-Based High-Resolution Interferometer Sounder (GB-HIS) in a costal marine environment
[AD-A268052] p 1114 N94-17503
An analysis of simulated and actual DMSP SSM/T-2 brightness temperatures
[AD-A268103] p 1109 N94-17573

ATMOSPHERIC PHYSICS
Mesoscale modeling of the atmosphere
[AD-A263236] p 1098 N94-15132
Atmospheric transmittance between 1.0 and 2.0 micrometers
[AD-A267076] p 1098 N94-15539
Micro- and meso-scale simulations of magnetospheric processes related to the aurora and substorm morphology
[NASA-CR-193437] p 1102 N94-17527

ATMOSPHERIC PRESSURE
Transition metals in superheat melts
p 962 N94-16273

ATMOSPHERIC RADIATION
Statement on global climate change before the Subcommittee on Energy and Power, United States House of Representatives
[DE93-013163] p 1095 N94-16006

ATMOSPHERIC REFRACTION
Johnson-Gierhart program predictions of excess propagation loss for super-high frequency air-to-ground paths. Volume 2: Appendices
[AD-A267021] p 987 N94-15527
Two color satellite laser ranging upgrades at Goddard's 1.2m telescope facility p 915 N94-15581
Airborne 2 color ranging experiment
p 920 N94-15614
Johnson-Gierhart program predictions of excess propagation loss for super-high frequency air-to-ground paths. Volume 1: Theory and numerical results
[AD-A267105] p 988 N94-15649
Forecasting the ducting of electromagnetic waves on the mesoscale
[AD-A268101] p 1109 N94-17571

ATMOSPHERIC SCATTERING
Software for the derivation of scaled surface reflectances from AVIRIS data p 1072 N94-16700
Micro pulse laser radar
[NASA-CASE-GSC-13493-1] p 1004 N94-17322

ATMOSPHERIC SOUNDING
Streak camera based SLR receiver for two color atmospheric measurements p 914 N94-15573
Electron reversal ionizer for detection of trace species using a spherical cathode
[NASA-CASE-NPO-18870-1-CU] p 1185 N94-17329
Opposing mesoscale flows in a broken midlatitude squall line
[AD-A268011] p 1109 N94-17492
An investigation of the Ground-Based High-Resolution Interferometer Sounder (GB-HIS) in a costal marine environment
[AD-A268052] p 1114 N94-17503
EOS Laser Atmosphere Wind Sounder (LAWS) investigation
[NASA-CR-193445] p 1109 N94-17525

ATMOSPHERIC TEMPERATURE
Application of split window technique to TIMS data
p 1064 N94-16601
Atmospheric corrections for TIMS estimated emittance
p 1064 N94-16602
An investigation of the Ground-Based High-Resolution Interferometer Sounder (GB-HIS) in a costal marine environment
[AD-A268052] p 1114 N94-17503
Propagation characteristics of mesoscale convective systems
[AD-A268130] p 1109 N94-17522
Boundary layer structure over areas of heterogeneous heat fluxes
[DE93-010657] p 1110 N94-17673

ATMOSPHERIC TURBULENCE
Effects of turbulence on the geodynamic laser ranging system p 921 N94-15616
Further development and testing of a second-order bulk boundary layer model
[AD-A268071] p 1109 N94-17552

ATMOSPHERIC WINDOWS
Separation of cirrus cloud from clear surface from AVIRIS data using the 1.38 micron water vapor band
p 1072 N94-16699

ATMOSPHERICS
Earth system dynamics: The interrelation of atmospheric, ocean and solid earth dynamics
[NASA-CR-193487] p 1081 N94-17444

ATOMIC BEAMS
Atomic beam studies relevant to the space environment
[AD-A268628] p 1186 N94-17436

ATOMIC CLOCKS
Quartz crystal resonators and oscillators for frequency control and timing applications: A tutorial, revision 6.1
[AD-A268205] p 1216 N94-17480

ATOMIC COLLISIONS
Atomic processes in hydrogen and deuterium negative ion discharges
[DE93-013432] p 1183 N94-16817

ATOMIC ENERGY LEVELS
Merged beam studies of laser stimulated radiative recombination
[AD-A267186] p 1037 N94-15145
Photodegradation of polyimides. V1: Effect of donor-acceptor groups on the photooxidative stability of polyimides and model compounds
[AD-A267319] p 970 N94-16947
The photochemistry of poly(methylphenylphosphazene)
[AD-A267320] p 970 N94-16948
The photophysics of poly(methylphenylphosphazene)
[AD-A267321] p 970 N94-16949

ATOMIC EXCITATIONS
Molecular processes in comets
[NASA-CR-194148] p 1239 N94-15188

ATOMIC INTERACTIONS
Single-collision studies of energy transfer and chemical reaction
[DE93-017603] p 1182 N94-16121

ATOMIC STRUCTURE
Electronic and atomic structure of semiconductors and of high-temperature superconductors
[AD-A266805] p 1205 N94-14913
Passive oxide films on well-defined nickel surfaces: An examination of film growth on Ni(100) with ex situ scanning tunneling microscopy
[DE93-014056] p 1207 N94-15923
Electronic structure and enthalpy of hydrogen and helium mixtures
[DE93-014128] p 1208 N94-15976
Photoemission study of diamond (100) surface
[DE93-015251] p 1208 N94-16062
Water adsorption on diamond (110) studied by multiple internal reflection infrared spectroscopy
[AD-A266415] p 948 N94-16553
Scintillation mechanism in stoichiometric cerium compounds
[DE93-015499] p 948 N94-16771
Growth and doping of Al(x)Ga(1-x)N films by electron cyclotron resonance assisted molecular beam epitaxy
[AD-A267305] p 1212 N94-16992
Atomic layer epitaxy group IV materials: Surface processes, thin films, devices and their characterization
[AD-A267527] p 1213 N94-17116
Theoretical studies of the crystal structure of rare earths and actinides at zero temperature
[DE93-016488] p 1214 N94-17301

ATOMIZERS
Coaxial airblast atomizers
[NASA-CR-193845] p 1016 N94-15109
Two-dimensional, high flow, precisely controlled monodisperse drop source
[AD-A267660] p 1028 N94-17250
Cryogenic spray vaporization in high-velocity helium, argon and nitrogen gasflows
[NASA-TM-106363] p 1035 N94-17446

ATOMIZING
Cryogenic spray vaporization in high-velocity helium, argon and nitrogen gasflows
[NASA-TM-106363] p 1035 N94-17446

ATOMS
Chemical and displacement atomic pair correlations in crystalline solid solutions recovered by anomalous x ray scattering in Fe-Ni alloys
[DE93-015906] p 1209 N94-16171

ATTENUATION COEFFICIENTS
Optical properties of the Red Sea
[AD-A266466] p 1113 N94-16588

ATTITUDE (INCLINATION)
Interferometric GPS attitude: A stochastic error model, DREO report
[AD-A266411] p 864 N94-16457
Tilt mechanism
[AD-D015780] p 1047 N94-16548
Space Station/Orbiter berthing dynamics during an assembly flight
[NASA-TM-109049] p 1062 N94-17451

ATTITUDE CONTROL
Standard platforms for small satellites
p 895 N94-17181
Space Station/Orbiter berthing dynamics during an assembly flight
[NASA-TM-109049] p 1062 N94-17451

ATTITUDE STABILITY
ERS-1: 18 months in orbit p 990 N94-15888

AUDIO EQUIPMENT
STS-29 IMAX camera audio class FFT
[NASA-TM-109543] p 1031 N94-15374

AUDITORY DEFECTS
Hearing Conservation Medical Program
p 1127 N94-16639

AUDITORY PERCEPTION
A virtual acoustic orientation instrument
[AD-A268181] p 1134 N94-17510

AUDITORY SENSATION AREAS
Cortical adaptive filtering in bioacoustic signal classification
[AD-A266229] p 1177 N94-16939

AUDITORY SIGNALS
Cortical adaptive filtering in bioacoustic signal classification
[AD-A266229] p 1177 N94-16939
A virtual acoustic orientation instrument
[AD-A268181] p 1134 N94-17510
Activities of the Research Laboratory of Electronics
[AD-A266730] p 1304 N94-17651

AUGER SPECTROSCOPY
A sulfur segregation study of PWA 1480, NiCrAl, and NiAl alloys
[NASA-TM-106289] p 956 N94-15992
Electron spectroscopy analysis
[NASA-CR-193591] p 951 N94-17039
Optimisation and specification of Auger electron spectrometers for signal-to-noise ratio performance
[NPL-DMM(A)-101] p 1006 N94-17549

AURORAL ARCS
Formation of the stable auroral arc that intensifies at substorm onset
[NASA-CR-193637] p 1098 N94-15433
Micro- and meso-scale simulations of magnetospheric processes related to the aurora and substorm morphology
[NASA-CR-193437] p 1102 N94-17527

AURORAL IONIZATION
Atmospheric ionization by solar particles detected by nitrate measurement in antarctic snow
[AD-A267583] p 1299 N94-17208

AURORAL SPECTROSCOPY
Global auroral imaging: Dynamics of Explorer Miss ion
[NASA-CR-194284] p 1097 N94-15003

AURORAL ZONES
A correlative comparison of geomagnetic storms and auroral substorms using geomagnetic indeces
[AD-A268081] p 1102 N94-17512

AURORAS
Global auroral imaging: Dynamics of Explorer Miss ion
[NASA-CR-194284] p 1097 N94-15003
Development of an ultra violet auroral imager for the Freja project p 904 N94-15060
A new detector concept for energetic auroral x ray imaging p 907 N94-15081
Requirements on CCD-detectors for ground-based auroral imaging p 909 N94-15093
Optical ionospheric instrumentation and research
[AD-A266403] p 1192 N94-16550
Multispectral observations of the Jovian aurora
[NASA-CR-193628] p 1297 N94-16884
An electromagnetic interference study of potential transmitter sites for the HF Active Auroral Research Program (HAARP)
[AD-A267743] p 1004 N94-17373
A correlative comparison of geomagnetic storms and auroral substorms using geomagnetic indeces
[AD-A268081] p 1102 N94-17512

AUSTENITE
Influence of grain size on the energy storing ability during uniaxial stretching of austenite steel
[IFTR-22/1992] p 961 N94-17121

AUSTRALIA
Space commerce in a global economy: Comparison of US and Australian approaches
[NASA-TM-109341] p 1235 N94-17290

AUTOCATALYSIS
Studies of premixed laminar and turbulent flames at microgravity
[NASA-CR-194656] p 951 N94-17125

AUTOMATED PILOT ADVISORY SYSTEM
The 1980 highlights
[NASA-TM-109672] p 1303 N94-15509

AUTOMATED TRANSIT VEHICLES
YARF: An open-ended framework for robot road following
[AD-A266788] p 1163 N94-14910
AUTOMATIC CONTROL
RACCOON: A Real-Time Autonomous Car Chaser Operating Optimally at Night
[AD-A266963] p 863 N94-14971
The Marshall Automated Weld System (MAWS)
[TABES PAPER 93-602] p 1049 N94-16138
Cognitive engineering models in space systems
[NASA-CR-193473] p 1140 N94-16716
An object-oriented program specification for a mobile robot motion control language
[AD-A267213] p 1166 N94-16986
Automated image analysis method for the detection of cracks on wood surface
[VTT-JULK-755] p 1056 N94-17542
AUTOMATIC FLIGHT CONTROL
Development of an air-to-air refueling automatic flight control system using quantitative feedback theory
[AD-A266718] p 870 N94-15730
AUTOMATIC WEATHER STATIONS
A comparison of ceiling and visibility observation for NWS manned observation sites and ASOS sites
[AD-A268356] p 1108 N94-17459
AUTOMATION
Fault management for data systems
[NASA-TM-103953] p 1116 N94-15548
AUTOMOBILES
RACCOON: A Real-Time Autonomous Car Chaser Operating Optimally at Night
[AD-A266963] p 863 N94-14971
Techno-economic requirements for automotive composites p 937 N94-16847
AUTONOMIC NERVOUS SYSTEM
Reliability of autonomic responses and malaise across multiple motion sickness stimulation tests
[NASA-TM-108787] p 1121 N94-15711
AUTONOMOUS NAVIGATION
YARF: An open-ended framework for robot road following
[AD-A266788] p 1163 N94-14910
Perception for outdoor navigation
[AD-A266867] p 863 N94-14919
Panacea: An active sensor controller for the ALVINN autonomous driving system
[AD-A266964] p 864 N94-14972
Massively parallel, adaptive, color image processing for autonomous road following
[AD-A266988] p 864 N94-15498
AVALANCHE DIODES
X-ray spectroscopy with silicon pin and avalanche photo diodes p 906 N94-15072
Work at Graz on satellite signatures p 898 N94-15558
Performance optimization of detector electronics for millimeter laser ranging p 913 N94-15569
Tracking capabilities of SPADs for laser ranging p 914 N94-15570
How to squeeze high quantum efficiency and high time resolution out of a SPAD p 914 N94-15571
Measuring atmospheric dispersion with WLRS in multiple wavelength mode p 916 N94-15582
The new MTLRS-1 receiving system p 877 N94-15611
The new MTLRS transmitting system p 877 N94-15612
AVIATION METEOROLOGY
Windshear database for forward-looking systems certification
[NASA-TM-109012] p 1108 N94-17283
AVIONICS
Development of a proposed international standard for certification of aircraft to High Intensity Radiated Fields (HIRF)
[NASA-TM-106357] p 863 N94-16520
Power Reactant Storage Assembly (PRSA) (Space Shuttle). PRSA hydrogen and oxygen DVT tank refurbishment
[NASA-CR-188262] p 926 N94-16922
Satellite communications installation plan
[AD-A266303] p 1000 N94-16965
Embedded computer systems: Status of C-17 software
[AD-A267307] p 1160 N94-16993
AXIAL LOADS
Design of a cruciform bend specimen for determination of out-of-plane biaxial tensile stress effects on fracture toughness for shallow cracks
[DE93-015455] p 1059 N94-16104
The processing and mechanical properties of high temperature/high performance composites. Book 5: Processing and miscellaneous properties
[AD-A266398] p 935 N94-16529
Overview of the FAA/DCA/NLR programs related to ageing aircraft
[NLR-TR-92119-U] p 854 N94-17614
AXIAL STRAIN
Damage evolution in filled elastomers
[AD-A268067] p 1062 N94-17507
AXIAL STRESS
Evaluation of the interfacial mechanical properties in fiber-reinforced ceramic composites
[DE93-015494] p 935 N94-16461
Evaluation of interfacial properties of fiber-reinforced ceramic composites using fiber push-in tests
[DE93-015427] p 972 N94-17253
AXISYMMETRIC BODIES
Wind tunnel investigation of three axisymmetric cowls of different lengths at Mach numbers from 0.60 to 0.92
[NASA-TM-4488] p 856 N94-15681
AZIDES (ORGANIC)
Amide and tetrazene complexes of transition and main group elements as precursors for the low temperature synthesis of elemental nitrides
[AD-A266246] p 950 N94-16931

B

B-70 AIRCRAFT
The 1968 highlights — NASA programs and research
[NASA-TM-109627] p 1302 N94-15413
BACKSCATTERING
Fine scale measurements of microwave backscatter from the ocean surface
[AD-A264516] p 1111 N94-15134
Double stimulated Brillouin scattering p 1200 N94-15205
Dynamics of douple stimulated Brillouin scattering p 1200 N94-15206
New methods of generation of ultrashort laser pulses for ranging p 913 N94-15565
Thomson backscattered x rays from an intense laser beam
[AD-A267125] p 1038 N94-15686
Method and apparatus for non-destructive evaluation of composite materials with cloth surface impressions
[NASA-CASE-LAR-14535-1] p 933 N94-15878
Radar response of vegetation: An overview p 991 N94-15898
Multifrequency observations p 992 N94-15902
Spatial and frequency diversity in lidar systems
[AD-A266192] p 1039 N94-16124
Radar properties of several fluidized ejecta blankets on Venus p 1267 N94-16278
Comparison of modeled backscatter with SAR data at P-band p 1076 N94-16735
SAR backscatter from coniferous forest gaps p 1076 N94-16736
Retrieval of pine forest biomass using JPL AIRSAR data p 1076 N94-16737
Relating multifrequency radar backscattering to forest biomass: Modeling and AIRSAR measurement p 1077 N94-16741
Investigation of AIRSAR signatures of the Gulf Stream p 1077 N94-16743
Detecting surface roughness effects on the atmospheric boundary layer via AIRSAR data: A field experiment in Death Valley, California p 1078 N94-16747
Extraction of quantitative surface characteristics from AIRSAR data for Death Valley, California p 1078 N94-16748
Fitting a three-component scattering model to polarimetric SAR data p 1079 N94-16751
Evaluation of polarimetric SAR parameters for soil moisture retrieval p 1079 N94-16755
Interaction types and their like-polarization phase-angle difference signatures p 1079 N94-16756
Lithological and textural controls on radar and diurnal thermal signatures of weathered volcanic deposits, Lunar Crater region, Nevada p 1080 N94-16762
BACKSCAT lidar simulation version 3.0: Technical documentation and users guide
[AD-A267296] p 1003 N94-17268
Characterization of Ni on Si wafers: Comparison of surface analysis techniques
[DE93-016501] p 953 N94-17649
BACKWARD WAVE TUBES
Measurements of the operation of the SINUS-6/BWO system
[AD-A266423] p 1011 N94-16556
BACKWARD WAVES
Measurements of the operation of the SINUS-6/BWO system
[AD-A266423] p 1011 N94-16556
BACTERIA
Efficacy of flocculating and other emergency water purification tablets
[AD-A266695] p 1148 N94-15840
Isolation of thermostable enzyme mutants by cloning and selection in thermophilic bacteria
[AD-A266378] p 1117 N94-16514
Biofilm structure and diversity
[AD-A267254] p 1118 N94-16989
Regulation of attached bacterial growth by adsorbed proteins
[AD-A267756] p 1118 N94-17275
BACTERIOLOGY
Legionella: An overview p 1126 N94-16629
BAFFLES
Acoustic waves in complicated geometries and their interactions with liquid-propellant droplet combustion
[AD-A267260] p 1178 N94-16991
BAILOUT
STS-35 Crew training: Bailout in CCT, firefighting, TAGS class and bailout in WFTF
[NASA-TM-109489] p 1135 N94-15195
STS-34 crew bailout exercise in CCT
[NASA-TM-109465] p 1135 N94-15360
STS-32 bailout training in WETF
[NASA-TM-109476] p 1136 N94-15383
STS-29 crew bailout in WETF
[NASA-TM-109548] p 1136 N94-15385
STS-33 emergency egress training
[NASA-TM-109525] p 1136 N94-15388
STS-31 crew training inflight maintenance and bailout exercises in CCT and WFTF
[NASA-TM-109483] p 876 N94-15450
STS-38 crew training: Habitation equipment procedures, bailout in CCT, 70mm photo class, EVA prep and post, and firefighting
[NASA-TM-109494] p 1136 N94-15453
STS-41 crew training bailout in CCT, 16mm camera class EVA prep, habitation equipment procedures, and food tasting
[NASA-TM-109517] p 876 N94-15517
BALLISTICS
An electronic imaging system for the Aeroballistic Research Facility
[AD-A267157] p 1033 N94-15826
BALLOON FLIGHT
Middle atmospheric electric fields over thunderstorms
[NASA-CR-194619] p 1106 N94-16493
BALLOON SOUNDING
The 1980 highlights
[NASA-TM-109672] p 1303 N94-15509
BALLOON-BORNE INSTRUMENTS
Silicon gallium doped photoconductor development for the AROME balloon borne instrument p 908 N94-15087
Mars laser altimeter based on a single photon ranging technique p 921 N94-15619
BALLOONING MODES
High beta and confinement studies of TFTR
[DE93-016204] p 1202 N94-16446
Structure and damping of toroidal drift waves (and their implications for anomalous transport)
[DE93-014005] p 1203 N94-16822
BANACH SPACE
Asymptotic behavior of firmly non expansive sequences
[DE93-628589] p 1171 N94-17642
Fixed point iterations for strictly hemi-contractive maps in uniformly smooth Banach spaces
[DE93-628591] p 1175 N94-17644
Steepest descent approximations for accretive operator equations
[DE93-628586] p 1171 N94-17667
BAND STRUCTURE OF SOLIDS
Optoelectronics based on SiGe/Si heterostructures
[AD-A267178] p 1190 N94-15848
Theoretical studies of the crystal structure of rare earths and actinides at zero temperature
[DE93-016488] p 1214 N94-17301
BANDPASS FILTERS
Filters for the International Solar Terrestrial Physics (ISTP) mission far ultraviolet imager
[NASA-CR-194633] p 1190 N94-15868
JPL activities on development of acousto-optic tunable filter imaging spectrometer p 1037 N94-16696
BANDWIDTH
Bandwidth characteristics of multimedia data traffic on a local area network
[NASA-TM-104026] p 883 N94-15648
Low-Complexity, High-Performance Bandwidth Efficient Coding and Coded Modulation Techniques for Satellite and Space Communications
[NASA-CR-194623] p 997 N94-16506
Bandwidth efficient coding: Theoretical limits and real achievements. Error control techniques for satellite and space communications p 997 N94-16507
An approximation for computing reduction in bandwidth requirements using intelligent multiplexers
[AD-A267434] p 1001 N94-17026

Isochronets: A high-speed network switching architecture
[AD-A267811] p 1161 N94-17409
BAROCLINITY
Mesoscale frontogenesis: An analysis of two cold front case studies
[AD-A267950] p 1107 N94-17054
BAROMETERS
Cooperative projects in geodynamical instrumentation between the State Seismological Bureau (China) and the Royal Observatory of Belgium p 1037 N94-15806
BARRIER LAYERS
Vacancy condensation as the precursor to passivity breakdown
[DE93-012925] p 956 N94-15998
BARYONS
The quantum mass shift of the soliton in Skyrme model
[ITN-93-85219] p 1180 N94-15283
BASALT
First oxygen from lunar basalt p 1249 N94-16182
Assimilation of solids during ascent of magmas from the Bartoy Field of the Baikal Region, Siberia p 1103 N94-16214
The physical mechanism of comet outbursts: An experiment p 1242 N94-16221
Bubble coalescence in magmas p 1103 N94-16237
Overturn of magma ocean ilmenite cumulate layer: Implications for lunar magmatic evolution and formation of a lunar core p 1261 N94-16242
Petrologic models of 15388, a unique Apollo 15 mare basalt p 1264 N94-16258
Searching for neuKREEP: An EMP study of Apollo 11 Group A basalts p 1266 N94-16275
On the composition of neuKREEP: QMD contamination at Apollo 11? p 1266 N94-16276
Angrite LEW87051: Are the olivines pheno's or xeno's? A continuing story p 1103 N94-16285
Partial melting of ordinary chondrites: Lost City (H) and St. Severin (LL) p 1243 N94-16286
The history of mare volcanism in the Orientale Basin: Mare deposit ages, compositions and morphologies p 1269 N94-16289
JSC-1: A new lunar regolith simulant p 1289 N94-16398
BATHYMETERS
Report detailing modifications to the 1/8 degree global bathymetry
[AD-A268178] p 1114 N94-17509
BAYES THEOREM
A new method for generating Bayes classifiers assuming mixtures of Gaussian densities
[FFI-91/4029] p 1172 N94-15298
A multilevel-multiresolution method for image processing. A Bayesian framework for reconstructing and representing shapes
[AD-A266772] p 1082 N94-15842
Set-based Bayesianism
[TR-407] p 1170 N94-16582
High order nonlinear estimation with signal processing applications
[AD-A268407] p 1005 N94-17463
BAYS (STRUCTURAL UNITS)
Computation of a controlled store separation from a cavity p 858 N94-16513
BEAM CURRENTS
Channel of the system for pulse charged particle beam diagnostics
[DE93-623867] p 1179 N94-14931
High beta and confinement studies of TFTR
[DE93-016204] p 1202 N94-16446
Fundamental-mode RF design in e(+)e(-) storage ring factories
[DE93-015249] p 1183 N94-16809
A review of some dynamics models in six-dimensional phase space and their suitable conditions of motion equation
[DE93-623741] p 1175 N94-17317
BEAM INJECTION
High beta and confinement studies of TFTR
[DE93-016204] p 1202 N94-16446
Six dimensional tracking simulator for H(-) injection in AGS Booster
[DE93-015396] p 1184 N94-16885
Emittance and beam size distortion due to linear coupling
[DE93-015402] p 1184 N94-16886
BEAM INTERACTIONS
Closed orbit distortion and the beam-beam interaction
[DE93-015284] p 1190 N94-15854
BEAM SPLITTERS
Display system employing acousto-optic tunable filter
[NASA-CASE-NPO-18736-1-CU] p 1190 N94-15933
VUV thin films, chapter 7
[NASA-CR-194634] p 967 N94-16494
Optical system storage design with diffractive optical elements p 1198 N94-17360
Test methods for acceptance testing of telescopes
[AD-A268316] p 1237 N94-17568
BEAMFORMING
Adaptive beamforming with imperfect arrays: Pattern effects and their partial correction
[AD-A267079] p 987 N94-15541
Broadband conventional beamforming incorporating adaptive equalization
[AD-A267090] p 987 N94-15544
BEAMS (RADIATION)
Experimental evaluation of an adaptive focusing algorithm for a microwave planar phased-array hyperthermia system at UCSF
[AD-A267004] p 1121 N94-15634
Six dimensional tracking simulator for H(-) injection in AGS Booster
[DE93-015396] p 1184 N94-16885
Laser beam steering device p 1045 N94-17357
BEAMS (SUPPORTS)
A novel approach for structural mechanics problems with stochasticity
[AD-A266189] p 1059 N94-16123
Static analysis of beams on an elastic base as stated by generalized functions
[IFTR-27/1991] p 1060 N94-16923
BEARINGS
Solid lubricants for space structures, phase 2
[AD-A266653] p 968 N94-16767
BED REST
Activity/rest patterns of instructor and rates student pilots during rapid transitions from daytime to nighttime duty hours at the Eastern Army Aviation Training site
[AD-A267038] p 1131 N94-15659
BEDROCK
Lithological and textural controls on radar and diurnal thermal signatures of weathered volcanic deposits, Lunar Crater region, Nevada p 1080 N94-16762
BEHAVIOR
The behavioral toxicology of high-peak, low average power, pulsed microwave irradiation
[AD-A268392] p 1134 N94-17535
BELLOWS
Design of a fluid elastic actuator with application to structure control
[AD-A267649] p 897 N94-17246
BENDING
Direct observation of fracture of CAS-glass/SiC composites and processing of toughened alumina
[AD-A268275] p 941 N94-17457
BENDING FATIGUE
The influence of secondary bending on fatigue life improvement in bolted joints
[ARL-RR-14] p 1058 N94-15963
BENZENE
Mechanistic models of soot formation
[AD-A267806] p 950 N94-17008
BERNOULLI THEOREM
Bounds on inconsistent inferences for sequences of trials with varying probabilities
[AD-A267146] p 1172 N94-15733
BERYLLIUM
Laboratory for x ray optics
[AD-A267149] p 1189 N94-15735
BETA PARTICLES
On the 17-keV neutrino
[DE93-012638] p 1181 N94-15974
Neutrino mass and mixing: Summary of the neutrino sessions
[DE93-014342] p 1183 N94-16801
Neutral-current detection in the Sudbury Neutrino Observatory
[DE93-014481] p 1185 N94-16951
BIAS
Timebias corrections to predictions p 875 N94-15591
Formation of on-site normal points p 917 N94-15592
Laser ranging data analysis
[NASA-CR-193547] p 1041 N94-16719
BIBLIOGRAPHIES
Bibliography on snow and ice friction
[AD-A266868] p 1045 N94-14920
SeaWiFS technical report series. Volume 12, SeaWiFS technical report series cumulative index: Volumes 1-11
[NASA-TM-104566-VOL-12] p 1111 N94-15529
Aeronautical engineering: A continuing bibliography with indexes (supplement 295)
[NASA-SP-7037(295)] p 854 N94-16480
Commonwealth of Independent States aerospace science and technology, 1992: A bibliography with indexes
[NASA-SP-7106] p 854 N94-16481
Publications of the Exobiology Program for 1991: A special bibliography
[NASA-TM-4483] p 1139 N94-17017
Bibliography of short wavelength chemical laser research
[AD-A267619] p 1041 N94-17195
The 1990-1991 NASA space biology accomplishments
[NASA-TM-4501] p 1118 N94-17257
Abstracts of manuscripts submitted in 1992 for publication
[AD-A267963] p 1113 N94-17383
BINARY ALLOYS
Transient phenomena following precipitation and re-solution anneals in a NiTi alloy
[AD-A267557] p 961 N94-17106
BINARY CODES
Search for optimal distance spectrum convolutional codes p 998 N94-16509
BINARY DATA
Spatial filters for optical correlation
[AD-A267199] p 1189 N94-15791
Unipolar terminal-attractor based neural associative memory with adaptive threshold
[NASA-CASE-NPO-18790-1-CU] p 1165 N94-15958
BINARY MIXTURES
Rheology and microstructure of concentrated zirconia-alumina suspensions for gelcasting composites
[DE93-015339] p 966 N94-16016
BINARY PHASE SHIFT KEYING
Low-Complexity, High-Performance Bandwidth Efficient Coding and Coded Modulation Techniques for Satellite and Space Communications
[NASA-CR-194623] p 997 N94-16506
A simulation study of the performance of the NASA (2,1,6) convolutional code on RFI/burst channels p 997 N94-16508
BINARY SYSTEMS (MATERIALS)
Highly transient elastodynamic crack growth in a bimaterial interface: Higher order asymptotic analysis and optical experiments
[AD-A266465] p 1059 N94-16587
BINAURAL HEARING
Leak detection utilizing analog binaural (VLSI) techniques
[NASA-CASE-NPO-18399-1-CU] p 1014 N94-17323
BINDERS (MATERIALS)
Fabrication of advanced design (grooved) cermet anodes
[DE93-014590] p 1012 N94-16765
Thin composite solid electrolyte film for lithium batteries
[NASA-CASE-NPO-18694-1-CU] p 1014 N94-17325
BINOMIAL THEOREM
The distribution of a sum of binomial random variables
[AD-A266969] p 1172 N94-15002
BIOACOUSTICS
Cortical adaptive filtering in bioacoustic signal classification
[AD-A266229] p 1177 N94-16939
BIOASTRONAUTICS
Movement in microgravity
[NASA-TM-109526] p 881 N94-15389
Exposure fluctuations of astronauts due to orientation
[NASA-TP-3364] p 1300 N94-15816
Aircrew/groundcrew life support systems research. Volume 1: CLIN 0001 research requirements
[AD-A268229] p 1139 N94-17563
Aircrew/groundcrew life support systems research. Volume 2: CLIN 0002 task order requirements
[AD-A268230] p 1139 N94-17564
BIOCHEMISTRY
Evaluation of spatial productivity patterns in an annual grassland during an AVIRIS overflight
[CIW-PUBL-1134] p 1067 N94-16672
A linear spectral matching technique for retrieving equivalent water thickness and biochemical constituents of green vegetation p 1068 N94-16678
Exploring the remote sensing of foliar biochemical concentrations with AVIRIS data p 1069 N94-16683
Biofilm structure and diversity
[AD-A267254] p 1118 N94-16989
Aircrew/groundcrew life support systems research. Volume 2: CLIN 0002 task order requirements
[AD-A268230] p 1139 N94-17564
BIOCONVERSION
Publications of the Oak Ridge National Laboratory Fossil Energy Program, 1 October 1991 - 31 March 1993
[DE93-014643] p 1232 N94-16967
BIODYNAMICS
Living well in space: Ensuring crew capability
[NASA-TM-109538] p 1120 N94-15369
BIOGEOCHEMISTRY
Strategies for detection of floodplain inundation with multi-frequency polarimetric SAR p 1076 N94-16739

BIOLOGICAL EFFECTS
Determination of the electromagnetic fields radiated from the ARES EMP simulator
[AD-A267069] p 988 N94-15668
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 378)
[NASA-SP-7011(378)] p 1122 N94-16478
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 380)
[NASA-SP-7011(380)] p 1122 N94-16479
TransRapid TR-07 maglev-spectrum magnetic field effects on daily pineal indoleamine metabolic rhythms in rodents
[DE93-015143] p 1117 N94-16893
The role of constitutive and inducible processes in the response of human squamous cell carcinoma cell lines to ionizing radiation
[DE93-015150] p 1129 N94-16970
Bioeffects of radiofrequency radiation on cell growth and differentation. Volume 1: Engineering considerations
[AD-A267754] p 1118 N94-17232
The behavioral toxicology of high-peak, low average power, pulsed microwave irradiation
[AD-A268392] p 1134 N94-17535
BIOLOGICAL EVOLUTION
Publications of the Exobiology Program for 1991: A special bibliography
[NASA-TM-4483] p 1139 N94-17017
BIOMASS
Recent advances in radar remote sensing of forest p 991 N94-15897
Using endmembers in AVIRIS images to estimate changes in vegetative biomass p 1070 N94-16689
Measuring dry plant residues in grasslands: A case study using AVIRIS p 1072 N94-16697
Retrieval of pine forest biomass using JPL AIRSAR data p 1076 N94-16737
Relating multifrequency radar backscattering to forest biomass: Modeling and AIRSAR measurement p 1077 N94-16741
Biomass energy: State of the technology present obstacles and future potential
[DE93-016295] p 1092 N94-16766
BIOPHYSICS
Driving terrestrial ecosystem models from space p 991 N94-15896
Bioorganic models for protein ion channels
[AD-A266365] p 1117 N94-16441
Retrieval of biophysical parameters with AVIRIS and ISM: The Landes Forest, south west France p 1068 N94-16681
BIOPROCESSING
An advanced bioprocessing concept for the conversion of wastepaper to ethanol
[DE93-015209] p 975 N94-16807
Publications of the Oak Ridge National Laboratory Fossil Energy Program, 1 October 1991 - 31 March 1993
[DE93-014643] p 1232 N94-16967
BIOREACTORS
Biofilm structure and diversity
[AD-A267254] p 1118 N94-16989
BIOSATELLITES
Ontogenesis of mammals in microgravity
[NASA-TM-103978] p 1139 N94-17636
BIOTECHNOLOGY
Materials Research Society Symposium Proceedings, Volume 292: Biomolecular Materials
[AD-A265776] p 1116 N94-15138
Annual historical report, calendar year 1992
[AD-A267050] p 1121 N94-15663
Canadian microgravity experiments flown in 1989-1990 p 977 N94-16075
BIPOLAR TRANSISTORS
Large signal characterization and modeling of heterojunction bipolar transistors
[AD-A266184] p 1012 N94-16935
BIREFRINGENCE
Characterization facility for magneto-optic media and systems p 1226 N94-14983
Measurement of birefringence for optical recording disk substrates p 1227 N94-14989
Pulse propagation in inhomogeneous optical waveguides
[DE93-013378] p 1191 N94-16007
Subwavelength structured surfaces and their applications p 1194 N94-17337
BIT ERROR RATE
Using Markov chains to model the error behavior of data communications channels
[AD-A266468] p 999 N94-16777
BITUMENS
Terrestrial bitumen analogue of orgueil organic material demonstrates high sensitivity to usual HF-HCl treatment p 930 N94-16325
BIVARIATE ANALYSIS
Statistics of the half-integer stopband
[DE93-016101] p 1173 N94-17236
BLACK BODY RADIATION
Fast-ICCD photography and gated photon counting measurements of blackbody emission from particulates generated in the KrF-laser ablation of BN and YBC
[DE93-015491] p 1210 N94-16460
BLACK HOLES (ASTRONOMY)
SUSY in the sky
[NIKHEF-H/93-04] p 1240 N94-17603
BLACKOUT (PHYSIOLOGY)
Cumulative effect of repeated brief cerebral ischemia
[AD-A267155] p 1121 N94-15736
BLADE TIPS
Turbine blade tip film cooling measurements
[AD-A267686] p 868 N94-14964
BLANKETS
Improved composite flexible blanket insulation
[NASA-CASE-ARC-11955-1-CU] p 934 N94-15926
BLASIUS FLOW
Inviscid instability of streamwise corner flow
[NASA-CR-191514] p 1021 N94-15834
BLINDNESS
Enhancing sight
[NASA-TM-109637] p 1221 N94-15248
BLOCK COPOLYMERS
Vectorial electron transfer in spatially ordered arrays
[DE93-018150] p 1185 N94-16971
BLOCKING
Optimisation of FIR photoconductors for atmospheric spectroscopy p 902 N94-15048
BLOOD
A mathematical model for the study of hemorrhagic shock and fluid resuscitation: Transcapillary exchange
[AD-A266427] p 1123 N94-16544
Bloodborne Pathogens Program p 1127 N94-16644
OSHA bloodborne pathogens standards exposure control plan p 1127 N94-16645
Release of iron from hemoglobin
[AD-A266503] p 1128 N94-16784
Methods to obtain blood samples periodically during exercise research studies while subjects are immersed in water or otherwise inaccessible
[AD-A268227] p 1130 N94-17562
Currents induced in the human body for exposure to ultrawideband electromagnetic pulses
[AD-A268570] p 1130 N94-17621
BLOOD CIRCULATION
A mathematical model for the study of hemorrhagic shock and fluid resuscitation: The systemic and pulmonary vasculature
[AD-A266835] p 1119 N94-14917
Increased vascular resistance with hemoglobin-based oxygen carriers
[AD-A266454] p 1123 N94-16565
The nature of dynamic arteriolar vasoreactivity: A mini-review and A classification scheme
[AD-A266499] p 1128 N94-16783
BLOOD FLOW
A mathematical model for the study of hemorrhagic shock and fluid resuscitation: The systemic and pulmonary vasculature
[AD-A266835] p 1119 N94-14917
Neuropeptide-Y (NPY) increases total blood flow in the tail, and reduces cutaneous microvascular blood flow in the tail and foot of the rat
[AD-A266839] p 1115 N94-14918
Transcranial Doppler ultrasound studies of cerebral blood-flow in microgravity p 981 N94-16095
The nature of dynamic arteriolar vasoreactivity: A mini-review and A classification scheme
[AD-A266499] p 1128 N94-16783
Automated strain gauge plethysmograph
[AD-A267323] p 1035 N94-17002
BLOOD PLASMA
A review of the efficacy of 7.5 percent NaCl/6 percent Dextran-70 (HSD) in experimental animals and humans
[AD-A266633] p 1122 N94-15740
BLOOD VESSELS
The nature of dynamic arteriolar vasoreactivity: A mini-review and A classification scheme
[AD-A266499] p 1128 N94-16783
BLOOD VOLUME
A mathematical model for the study of hemorrhagic shock and fluid resuscitation: The systemic and pulmonary vasculature
[AD-A266835] p 1119 N94-14917
A review of the efficacy of 7.5 percent NaCl/6 percent Dextran-70 (HSD) in experimental animals and humans
[AD-A266633] p 1122 N94-15740
A mathematical model for the study of hemorrhagic shock and fluid resuscitation: Transcapillary exchange
[AD-A266427] p 1123 N94-16544
A mathematical model for the study of hemorrhagic shock and fluid resuscitation: Exchange of fluid and solutes between vascular, interstitial, and tissue cell compartments
[AD-A266426] p 1123 N94-16558
BLOWING
Aerodynamic control of NASP-type vehicles through Vortex manipulation. Volume 1: Static water tunnel tests
[NASA-CR-177626-VOL-1] p 855 N94-15655
Aerodynamic control of NASP-type vehicles through Vortex manipulation. Volume 2: Static wind tunnel tests
[NASA-CR-177626-VOL-2] p 856 N94-15677
Aerodynamic control of NASP-type vehicles through vortex manipulation. Volume 3: Wing rock experiments
[NASA-CR-177626] p 857 N94-15780
BLUE STREAK LAUNCH VEHICLE
The launch of ELDO
[ESA-HSR-7] p 886 N94-16501
BLUNT BODIES
DSMC simulations of Mach 20 nitrogen flows about a 70 degree blunted cone and its wake
[NASA-TM-107762] p 1018 N94-15291
Particle simulation of hypersonic flow
[AD-A267185] p 857 N94-15787
Search for chaos in free shear flows
[AD-A266245] p 1023 N94-16470
Nonequilibrium radiation and chemistry models for aerocapture vehicle flowfields
[NASA-CR-194645] p 1027 N94-17095
BODY CENTERED CUBIC LATTICES
Electronic structure and enthalpy of hydrogen and helium mixtures
[DE93-014128] p 1208 N94-15976
Interfacial structure of lattice mismatched bcc(110)/bcc(110) transition metal superlattices
[DE93-015162] p 1208 N94-16058
High temperature materials technology research for advanced thermionic systems
[DE93-018302] p 960 N94-16964
BODY FLUIDS
A mathematical model for the study of hemorrhagic shock and fluid resuscitation: Exchange of fluid and solutes between vascular, interstitial, and tissue cell compartments
[AD-A266426] p 1123 N94-16558
OSHA bloodborne pathogens standards exposure control plan p 1127 N94-16645
BODY-WING AND TAIL CONFIGURATIONS
Aerodynamic control of NASP-type vehicles through vortex manipulation. Volume 3: Wing rock experiments
[NASA-CR-177626] p 857 N94-15780
BODY-WING CONFIGURATIONS
The effect of the nose shape and wing location toward the wing vortex breakdown
[AD-A267724] p 855 N94-14942
BOEING 727 AIRCRAFT
Satellite communications installation plan
[AD-A266303] p 1000 N94-16965
BOEING 747 AIRCRAFT
Computation of the Fluid and Optical Fields About the Stratospheric Observatory for Infrared Astronomy (SOFIA) and the Coupling of Fluids, Dynamics, and Control Laws on Parallel Computers
[NASA-CR-193168] p 858 N94-16510
BOILING
Pool boiling: Single bubble experiment p 944 N94-15160
Explosive boiling at very low heat fluxes: A microgravity phenomenon
[NASA-TM-106325] p 1046 N94-15817
Cellulose triacetate, thin film dielectric capacitor
[NASA-CASE-NPO-18935-1-CU] p 1010 N94-15952
Investigation of two-phase flow and boiling heat transfer during quenching of a tube under microgravity p 979 N94-16087
Cycle performance testing of nonazeotropic mixtures of HFC-142A/HCFC-124 and HFC-32/HCFC-124 with enhanced surface heat exchangers
[DE93-015215] p 1024 N94-16808
BOLOMETERS
Future development in cryogenic techniques for space p 901 N94-15042
Hot electron mixers, the potential competition p 903 N94-15055
Submm/FIR bolometers p 904 N94-15056
Developments in extreme ultraviolet and x ray instrumentation p 904 N94-15058
In orbit adiabatic demagnetization refrigeration for bolometric and microcalorimetric detectors p 907 N94-15079
The epitaxial Si x ray bolometer an alternative to ion implanted devices p 911 N94-15103
BOLTED JOINTS
The influence of secondary bending on fatigue life improvement in bolted joints
[ARL-RR-14] p 1058 N94-15963

BOLTZMANN TRANSPORT EQUATION
Discrete models of the Boltzmann equation: Structure of the collision operator of sound propagation
[IFTR-2/1992] p 1178 N94-17051
Linear characteristic spatial quadrature for discrete ordinates neutral particle transport on arbitrary triangles
[AD-A267485] p 1185 N94-17365
Calculations of cosmic-ray helium transport in shielding materials
[NASA-TP-3354] p 1301 N94-17666
BOLTZMANN-VLASOV EQUATION
Linear stability of stationary solutions of the Vlasov-Poisson system in three dimensions
[DE93-013873] p 1174 N94-16820
BONDED JOINTS
XPS analysis of Al/EPDM bondlines from IUS SRM-1 polar bosses
[AD-A266851] p 1056 N94-14945
Physical interpretation and development of ultrasonic nondestructive evaluation techniques applied to the quantitative characterization of textile composite materials
[NASA-CR-194549] p 931 N94-15190
BONDING
Evaluation of interfacial properties of fiber-reinforced ceramic composites using fiber push-in tests
[DE93-015427] p 972 N94-17253
BONDOC METEORITE
Cation ordering in orthopyroxenes and cooling rates of meteorites: Low temperature cooling rates of Estherville, Bondoc and Shaw p 1241 N94-16176
BONES
Micromechanics modeling and analysis of Haversian compact bone tissues as a fiber reinforced composite material
[AD-A268250] p 1129 N94-17456
BOOSTER ROCKET ENGINES
CPIA/M5 liquid propellant engine manual
[AD-A268062] p 929 N94-17589
BOREHOLES
Water-levels fluctuations in a borehole at the Royal Observatory of Belgium: Effects on local gravity, Earth tidal, and barometric responses p 1100 N94-15812
BORESIGHT ERROR
Radome depolarization effects on monopulse receiver tracking performance
[AD-A267446] p 1001 N94-17031
BORESIGHTS
Radome depolarization effects on monopulse receiver tracking performance
[AD-A267446] p 1001 N94-17031
BORON ISOTOPES
Nuclear fusion of protons with ions of boron
[DE93-015399] p 1202 N94-16019
BORON NITRIDES
Atomic layer epitaxy of boron nitride
[AD-A266260] p 1212 N94-16932
Growth of dielectric thin films by irradiation of condensed molecular precursors with synchrotron radiation
[DE93-016161] p 974 N94-17676
BOSONS
Theoretical high energy physics
[DE93-015884] p 1187 N94-16170
Heavy ion physics research at Creighton University
[DE93-016809] p 1185 N94-16957
BOUNDARY CONDITIONS
Boundary conditions for the paleoenvironment: Chemical and physical processes in the pre-solar nebula
[NASA-CR-194418] p 1298 N94-15421
Shielding from space radiations
[NASA-CR-194578] p 1180 N94-15715
A novel approach for structural mechanics problems with stochasticity
[AD-A266189] p 1059 N94-16123
An analysis of ways of determining the material constants for viscoelastic materials
[IFTR-28/91] p 951 N94-17050
Structured finite volume modeling of US Navy aircraft engine test cells. Task 1: Turboshaft engine, volume 1
[AD-A268176] p 873 N94-17432
Boundary conditions and the simulation of low Mach number flows
[NASA-TM-106374] p 1029 N94-17448
Global solutions to a system of strongly coupled reaction-diffusion equations
[DE93-628587] p 1171 N94-17640
BOUNDARY LAYER CONTROL
The turbulent wall jet
[AD-A267675] p 855 N94-14963
Riblets: New speed technology
[NASA-TM-109641] p 1018 N94-15252
Flow analysis for the nacelle of an advanced ducted propeller at high angle-of-attack and at cruise with boundary layer control
[NASA-TM-106371] p 858 N94-16571
Determining the effect of endwall boundary layer suction in a large scale subsonic compressor cascade
[AD-A267208] p 859 N94-16913
Active turbulence control in wall bounded flows using direct numerical simulation
[AD-A267261] p 1028 N94-17286
BOUNDARY LAYER EQUATIONS
Boundary layer flow of air over water on a flat plate
[NASA-CR-191517] p 1019 N94-15479
BOUNDARY LAYER FLOW
On the receptivity problem for 0(1) wavelength Goertler vortices
[NASA-CR-191519] p 1016 N94-15005
Tollmien-Schlichting/vortex interactions in compressible boundary layer flows
[NASA-CR-191515] p 1017 N94-15183
Special course on Shock-Wave/Boundary-Layer Interactions in Supersonic and Hypersonic Flows
[AGARD-R-792] p 1017 N94-15196
Swept shock/boundary-layer interactions: Scaling laws, flowfield structure, and experimental methods
p 1017 N94-15197
On the interaction between the shock wave attached to a wedge and freestream disturbances
[NASA-CR-191528] p 1019 N94-15478
Boundary layer flow of air over water on a flat plate
[NASA-CR-191517] p 1019 N94-15479
Parallel spatial direct numerical simulations on the Intel iPSC/860 hypercube
[NASA-CR-191513] p 1144 N94-15483
Complex terrain wind model evaluation
[AD-A266467] p 1096 N94-16589
Three-dimensional turbulent boundary layer
[AD-A266261] p 1025 N94-16908
Studies in turbulence and turbulence control
[AD-A266318] p 1026 N94-16950
Higher-order accurate Osher schemes with application to compressible boundary layer stability
[NASA-TM-106355] p 1026 N94-17056
Structure of turbulence in three-dimensional boundary layers
[NASA-CR-194655] p 1027 N94-17130
On the stability of a time dependent boundary layer
[NASA-CR-191542] p 1030 N94-17450
BOUNDARY LAYER SEPARATION
Unsteady separated flows: Empirical model and control
[AD-A267282] p 855 N94-14959
Swept shock/boundary-layer interactions: Scaling laws, flowfield structure, and experimental methods
p 1017 N94-15197
BOUNDARY LAYER STABILITY
Numerical study of compressible boundary-level transition between two concentric cylinders
[NASA-CR-194622] p 1025 N94-16842
Higher-order accurate Osher schemes with application to compressible boundary layer stability
[NASA-TM-106355] p 1026 N94-17056
On the stability of a time dependent boundary layer
[NASA-CR-191542] p 1030 N94-17450
Multigrid direct numerical simulation of the whole process of flow transition in 3-D boundary layers
[NASA-TM-106369] p 1030 N94-17557
BOUNDARY LAYER TRANSITION
Development of a quiet supersonic wind tunnel with a cryogenic adaptive nozzle
[NASA-CR-194548] p 871 N94-15117
Parallel spatial direct numerical simulations on the Intel iPSC/860 hypercube
[NASA-CR-191513] p 1144 N94-15483
Receptivity of boundary layers to convected gusts
[AD-A267206] p 1022 N94-15860
Turbulence and transition modeling for high-speed flows
[AD-A266748] p 1022 N94-15953
Natural convection above a horizontal heat source
[AD-A267212] p 1026 N94-16985
An experimental study of fluctuating wall pressures in a highly swept, sharp fin-induced, Mach 5 shock wave/turbulent boundary layer interaction
[AD-A268394] p 861 N94-17461
Multigrid direct numerical simulation of the whole process of flow transition in 3-D boundary layers
[NASA-TM-106369] p 1030 N94-17557
BOUNDARY LAYERS
Unsteady phenomena in shock wave/boundary layer interaction p 1017 N94-15200
Hypersonic shock wave boundary layer interactions over simplified deflected control surface configurations
p 1018 N94-15203
Supersonic flow visualization of a nacelle in close proximity to a simulated wing
[NASA-CR-194675] p 860 N94-17260
The stability and dynamics of elastic structures and fluid flows
[AD-A267990] p 1029 N94-17414
On the stability of a time dependent boundary layer
[NASA-CR-191542] p 1030 N94-17450
Boundary layer structure over areas of heterogeneous heat fluxes
[DE93-010657] p 1110 N94-17673
BOUNDARY LUBRICATION
Physical and chemical properties of some new perfluoropolyalkylether lubricants prepared by direct fluorination
[NASA-TM-106299] p 967 N94-16543
BOUNDARY VALUE PROBLEMS
Iteration scheme for the multiparameter nonlinear boundary value problem with the additional conditions and its application to some field models
[DE93-626638] p 1168 N94-14933
A posteriori error estimation for hierarchic models of elliptic boundary value problems on thin domains
[AD-A267714] p 1168 N94-14939
Adaptive wavelet collocation methods for initial value boundary problems of nonlinear PDE's
[NASA-CR-191507] p 1169 N94-15833
Finite difference time domain analysis of chirped dielectric gratings p 1195 N94-17339
Numerical solution of a second order boundary problem for two dimensions using galerkin approximations
[AD-A268128] p 1171 N94-17521
Numerically solving a transient heat conduction problem with convection and radiation
[AD-A268521] p 1220 N94-17540
Global solutions to a system of strongly coupled reaction-diffusion equations
[DE93-628587] p 1171 N94-17640
BRACKETS
RSRM nozzle actuator bracket/lug fracture mechanics qualification test
[NASA-CR-193859] p 927 N94-17080
BRAIDED COMPOSITES
Design and cost drivers in 2-D braiding
p 937 N94-16849
Development of braided fiber seals for engine applications p 939 N94-16859
Development of test methods for textile composites
p 939 N94-16862
Three-dimensional analysis of anisotropic spatially reinforced structures p 939 N94-16863
Evaluation of hybrid reinforcement (fiber-reinforced-plastic rod with steel core)
[AD-A268009] p 941 N94-17473
BRAIN
Neural mechanisms of attention
[AD-A266315] p 1132 N94-16456
Localizing visual function in the brain
[AD-A267381] p 1133 N94-17020
Synaptic plasticity and memory formation
[AD-A267988] p 1133 N94-17453
BREADBOARD MODELS
Results of an electrical power system fault study (CDDF)
[NASA-TP-3413] p 884 N94-15007
TRMM radar p 990 N94-15894
Wideband acousto-optic correlator for an ESM receiver upgrade
[TABES PAPER 93-661] p 1054 N94-16156
BREATHING APPARATUS
An apparatus for measuring the biological oxidation of hydrogen gas under hyperbaric conditions
[AD-A266834] p 1119 N94-14916
Firefighters breathing system
[NASA-TM-109611] p 1135 N94-15362
BRECCIA
First investigation of noble gases in the Dengli H3,8 chondrite p 953 N94-16264
A discontinuous melt sheet in the Manson impact structure p 1103 N94-16269
A Monazite-bearing clast in Apollo 17 melt breccia
p 1267 N94-16279
Apollo 17 materials viewed from 2 to 4 mm soil particles: Pre-serenitatis highlands components
p 1267 N94-16280
Partial melting of ordinary chondrites: Lost City (H) and St. Severin (LL) p 1243 N94-16286
Nitrogen isotopic signatures in agglutinates from breccia 79035 p 954 N94-16314
BREMSSTRAHLUNG
ARIES tokamak reactor study
[DE93-017059] p 1203 N94-16901
BRIDGMAN METHOD
Growth of new materials for solid state laser applications. The growth of ZnGeP2 by the vertical Bridgman method
[NASA-CR-194571] p 1038 N94-15530
Convection effects on radial segregation and crystal melt interface in vertical Bridgman growth
[NASA-CR-191541] p 1029 N94-17387
BRIGHTNESS
Effects of levitated dust on astronomical observations from the lunar surface p 1239 N94-16433

Perception of lightness and brightness in complex patterns
[AD-A268435] p 1134 N94-17513
Study of brightness and current limitations in intense charged particle beams
[AD-A268283] p 1186 N94-17578

BRIGHTNESS DISTRIBUTION
Optical effects of regolith processes on S asteroids as simulated by laser impulse alteration of ordinary chondrite p 1246 N94-16422

BRIGHTNESS TEMPERATURE
Brightness temperature and attenuation statistics at 20.6 and 31.65 GHz p 996 N94-16045
A quantitative analysis of TIMS data obtained on the Learjet 23 at various altitudes p 1063 N94-16597
Analysis of TIMS performance subjected to simulated wind blast p 1063 N94-16598
Application of split window technique to TIMS data p 1064 N94-16601
Investigation of cloud properties and atmospheric stability with MODIS
[NASA-CR-193475] p 1107 N94-16717
Nowcasting methods for satellite imagery
[AD-A267294] p 1108 N94-17267
An analysis of simulated and actual DMSP SSM/T-2 brightness temperatures
[AD-A268103] p 1109 N94-17573
An empirical study of tropical cloud clusters using special sensor microwave imager data
[AD-A268072] p 1110 N94-17595

BRILLOUIN EFFECT
Studies on the parametric decay of waves in fusion plasmas
[VTT-PUBS-110] p 1200 N94-15204
Double stimulated Brillouin scattering p 1200 N94-15205
Dynamics of douple stimulated Brillouin scattering p 1200 N94-15206
Soliton-like structures in double stimulated Brillouin scattering p 1200 N94-15207

BRILLOUIN ZONES
Photoemission study of diamond (100) surface
[DE93-015251] p 1208 N94-16062

BRINES
Mars brine formation experiment p 1293 N94-16419

BRITTLE MATERIALS
Elastooptical brittle materials in experimental studies of the state of stress and deformation
[IFTR-22/1991] p 1059 N94-16651
Static and dynamic investigations of brittle elasto-optical material
[IFTR-3/1992] p 1061 N94-17086

BRITTLENESS
Recent advances in ordered intermetallics
[DE93-015308] p 955 N94-15862
A reexamination of grain boundary fracture in Ni3Al: Environmental and alloying effects
[DE93-015431] p 1208 N94-16063
The processing and mechanical properties of high temperature/high performance composites. Book 1: Coonstituent properties of composites
[AD-A266394] p 935 N94-16483
The processing and mechanical properties of high temperature/high performance composites. Book 2: Coonstituent properties and macroscopic performance
[AD-A266395] p 935 N94-16484
The processing and mechanical properties of high temperature/high performance composites. Book 4: Coonstitutive laws and design
[AD-A266397] p 935 N94-16528

BROADBAND
Broadband teleseismic array recording in the Adirondack Mountains, New York State
[AD-A267290] p 1097 N94-14960
Broadband conventional beamforming incorporating adaptive equalization
[AD-A267090] p 987 N94-15544
Theoretical studies relating to the interaction of radiation with matter
[AD-A267134] p 1180 N94-15689
Filters for the International Solar Terrestrial Physics (ISTP) mission far ultraviolet imager
[NASA-CR-194633] p 1190 N94-15868
Wideband acousto-optic correlator for an ESM receiver upgrade
[TABES PAPER 93-661] p 1054 N94-16156
Enhanced down-range profiles of complex targets using wideband radar echo returns
[AD-A266508] p 999 N94-16788
Design of broadband wire antennas for frequency hopping applications
[AD-A267405] p 1001 N94-17025
On-board B-ISDN fast packet switching architectures. Phase 1: Study
[NASA-CR-191143] p 883 N94-17111
The analysis of low-profile, broadband, monopole, vehicle antennas and matching network synthesis
[AD-A268340] p 1006 N94-17582

BROADCASTING
Activities of Canadian Satellite Communications, Inc.
[CTN-93-60864] p 994 N94-15959
Test plan for the evaluation of the initial capability of the National Satellite Test Bed: Phase 1D
[DOT/FAA/RD-93/20] p 876 N94-16025

BROKEN SYMMETRY
Broken symmetry in ideal magnetohydrodynamic turbulence
[NASA-TM-109017] p 1023 N94-15964

BROMIDES
The effect of process parameters on the surface finish of plasma polymers
[DE93-014112] p 966 N94-15924

BROMINATION
Interpenetrating polymer network acoustic damping material
[AD-D015889] p 969 N94-16916

BRUSHES
Solid lubricants for space structures, phase 2
[AD-A266653] p 968 N94-16767

BRUSHES (ELECTRICAL CONTACTS)
Integrated fundamental research on current collection
[AD-A266987] p 1008 N94-15494

BSCCO SUPERCONDUCTORS
Advanced thin-film deposition and physical properties of high-temperature and other novel superconducting materials
[AD-A268199] p 1216 N94-17561

BUBBLE CHAMBERS
Preliminary results from bubble detector measurements aboard Biocosmos-2044 p 981 N94-16097

BUBBLES
Pool boiling: Single bubble experiment p 944 N94-15160
Laser-liquid interactions under reduced gravity conditions p 977 N94-16077
Gas bubble generation and transport in microgravity p 980 N94-16089
Bubble coalescence in magmas p 1103 N94-16237
Measurement of the velocity field and void fraction in a planar plunging jet
[AD-A268183] p 1030 N94-17511

BUCKLING
Comparison of level-1 and level-2 buckling and postbuckling solutions
[NASA-CR-194611] p 1057 N94-15154

BUCKMINSTERFULLERENE
Geochemistry and cosmochemistry of fullerenes 3: Reaction of C60 and C70 with ozone p 953 N94-16243

BUDGETS
Resources and activities of the European Space Agency p 1303 N94-16792

BUILDINGS
Satellite sound broadcast propagation measurements p 996 N94-16047
Assessment of trends in the development of residential buildings from the standpoint of the fuel and energy requirements
[IFTR-6/1991] p 1093 N94-17092

BULK MODULUS
Physical and chemical properties of some new perfluoropolyalkylether lubricants prepared by direct fluorination
[NASA-TM-106299] p 967 N94-16543

BURGER EQUATION
Numerical solution of SUPG finite-element method for supersonic viscous flow
[AD-A267762] p 860 N94-17222

BURNING RATE
Spectral studies of solid propellant combustion 4: Absorption and burn rate results for M43, XM39, and M10 propellants
[AD-A267119] p 946 N94-15685

BUS CONDUCTORS
VLSI for high-speed digital signal processing
[AD-A267709] p 1007 N94-14936
OETC optical backplane bus testbed. IBM tasks: Receiver OEIC and link simulation tools and analysis
[AD-A266198] p 1191 N94-16128

BUSHINGS
Solid lubricants for space structures, phase 2
[AD-A266653] p 968 N94-16767

C

C (PROGRAMMING LANGUAGE)
User manual and program description of the data acquisition system of PML-pulse physics
[AD-A266752] p 1147 N94-15776

C BAND
Evaluation of the TOPSAR performance by using passive and active calibrators p 1078 N94-16750

C++ (PROGRAMMING LANGUAGE)
An experimental comparison of CLOS and C(++) implementations of an object-oriented graphical simulation of walking robot kinematics
[AD-A267168] p 1165 N94-15855
C++ as a language for object-oriented numerics
[DE93-015027] p 1148 N94-15985

C-135 AIRCRAFT
Canadian microgravity experiments flown in 1989-1990 p 977 N94-16075
Development of the Laser-based R/D Test-bed System (LTS) p 978 N94-16080
Optical systems for the visualization of fluid and solid transparent media under microgravity conditions p 978 N94-16081
KC-135 acceleration monitoring and data acquisition system p 868 N94-16090

CADMIUM TELLURIDES
CdTe array detectors for high energy astronomy p 899 N94-15029
Research support for cadmium telluride crystal growth
[NASA-CR-193557] p 1210 N94-16646
Laser figuring for the generation of analog micro-optics and kineform surfaces p 1196 N94-17346
Fabrication of micro-optical devices p 1197 N94-17351

CALCITE
CO2 production by impact in carbonates? An ATEM and stable isotope (C,O) study p 954 N94-16383

CALCIUM CARBONATES
Earth's partial pressure of CO2 over the past 100-500 Ma; evidence from Ce anomalies in mostly shallow seas (less than 200 m) as recorded in carbonate sediments, 2 p 1104 N94-16360

CALCIUM COMPOUNDS
The role of interfacial chemistry in surface nucleation and growth of calcium oxalate
[DE93-015689] p 1209 N94-16159
Transformation toughening of composite ceramics
[AD-A267304] p 971 N94-16980

CALCIUM ISOTOPES
The role of interfacial chemistry in surface nucleation and growth of calcium oxalate
[DE93-015689] p 1209 N94-16159

CALCIUM OXIDES
Low-temperature sintering and phase changes in chromite interconnect materials
[DE93-015676] p 961 N94-17234

CALIBRATING
Validation of respiratory inductive plethysmography for measuring exercise tidal volumes
[AD-A266883] p 1119 N94-14923
Free-field sensitivity calibration of laboratory standard microphones by the reciprocity technique: Measurements for the 1991 EEC intercomparison
[NPL-RSA(EXT)-0043] p 1176 N94-15019
A test facility to calibrate EUV detectors p 873 N94-15062
Characterization of detectors and calibration of the ISOPHOT experiment p 907 N94-15082
Infrared detector annealing and calibration with IR-laser diodes p 909 N94-15092
Windshear radar calibration, 1992 flights: Transmitter power and receiver gain stability
[NASA-TM-108997] p 986 N94-15140
Testing and management of flight instruments and their data
[NASA-CR-194332] p 868 N94-15187
Heterodyne efficiency for a coherent laser radar with diffuse or aerosol targets
[NASA-CR-194563] p 1038 N94-15477
The precision of today's satellite laser ranging systems p 912 N94-15559
Sub-cm ranging and other improvements in Graz p 919 N94-15603
Optical attenuation mechanism upgrades, MOBLAS, and TLRS systems p 922 N94-15622
Calibration platforms for gravimeters p 1037 N94-15805
On tidal parameters at Brussels fundamental station p 1100 N94-15807
Calibration: Practical experience with ERS-1 p 992 N94-15907
A calibration of the production rate ratio P-21/P-26 by low energy secondry neutrons: Identification of Ne spallation components at the 10(exp 6) atoms/g level in terrestrial samples p 1187 N94-16194
The Clementine instrument complement p 1086 N94-16370
In-flight calibration of the spectral and radiometric characteristics of AVIRIS in 1991 p 1037 N94-16667
AVIRIS calibration and application in coastal oceanic environments p 1069 N94-16685

MAC Europe 1991: Evaluation of AVIRIS, GER imaging spectrometry data for the land application testsite Oberpfaffenhofen p 1070 N94-16688
Application of symmetry properties to polarimetric remote sensing with JPL AIRSAR data p 1079 N94-16752
External calibration of polarimetric radar images using distributed targets p 1079 N94-16753
Photo-assisted epitaxial growth for III-V semiconductors [AD-A267889] p 1213 N94-17042
Microwave reflectometer ionization sensor [NASA-CR-191464] p 922 N94-17083

CALIFORNIA
Tectonic deformation in southern California [NASA-CR-194621] p 1101 N94-16021

CALORIMETERS
Measurement of the specific heat capacity of the electron-beam graphite calorimeter [NPL-RSA(EXT)-40] p 1031 N94-15018
X ray microcalorimeters: Principles and performance p 899 N94-15027
Calorimeter based detectors for high energy hadron colliders [DE93-017055] p 1188 N94-16900
Contained (nu) events observed in Soudan 2 [DE93-015548] p 1300 N94-17233

CAMERAS
Development of an ultra violet auroral imager for the Freja project p 904 N94-15060
A new detector concept for energetic auroral x ray imaging p 907 N94-15081
STS-32 IMAX camera training [NASA-TM-109567] p 1031 N94-15316
STS-29 IMAX camera audio class FFT [NASA-TM-109543] p 1031 N94-15374
STS-29 crew IMAX camera training [NASA-TM-109546] p 1031 N94-15380
STS-34 Arriflex and IMAX camera training [NASA-TM-109467] p 1031 N94-15397
STS-31 crew Linof, Arriflex, and IMAX camera training [NASA-TM-109485] p 1032 N94-15792
Capaciflector camera [NASA-CASE-GSC-13564-1] p 1033 N94-15872
Transparent conductive coatings in the far ultraviolet [NASA-CR-194632] p 1191 N94-16024
The Clementine instrument complement p 1086 N94-16370
Exploiting world structure to efficiently search for objects [TR-434] p 1231 N94-16576

CAMS
Hydraulic pump with integral electric motor [AD-D015782] p 1011 N94-16549

CANADA
Optical systems for the visualization of fluid and solid transparent media under microgravity conditions p 978 N94-16081

CANADIAN SPACE PROGRAM
Canadian microgravity experiments flown in 1989-1990 p 977 N94-16075
Development of the Laser-based R/D Test-bed System (LTS) p 978 N94-16080
The Canadian Space Station user development program. Where do we go from here? p 898 N94-16084

CANCELLATION
A complete study of differential wax-wane focus servo technique p 1199 N94-14996

CANCER
Experimental evaluation of an adaptive focusing algorithm for a microwave planar phased-array hyperthermia system at UCSF [AD-A267004] p 1121 N94-15634
Quantitative method of measuring cancer cell urokinase and metastatic potential [NASA-CASE-MSC-21715-1] p 1117 N94-15967
Screening for prostate cancer p 1126 N94-16630
Asbestos Surveillance Program p 1127 N94-16638
Quantifying lifetime exposure to ultraviolet radiation in the epidemiology of cutaneous malignant melanoma: A pilot study [DE93-015274] p 1128 N94-16812
The role of constitutive and inducible processes in the response of human squamous cell carcinoma cell lines to ionizing radiation [DE93-015150] p 1129 N94-16970

CANOPIES
Definitions of terms relating to aircraft windscreens, canopies, and transparencies [AD-A268403] p 868 N94-17425

CANOPIES (VEGETATION)
Using AVIRIS images to measure temporal trends in abundance of photosynthetic and nonphotosynthetic canopy components p 1066 N94-16668
Evaluation of spatial productivity patterns in an annual grassland during an AVIRIS overflight [CIW-PUBL-1134] p 1067 N94-16672
A linear spectral matching technique for retrieving equivalent water thickness and biochemical constituents of green vegetation p 1068 N94-16678
Exploring the remote sensing of foliar biochemical concentrations with AVIRIS data p 1069 N94-16683
The 1991 AVIRIS/POLDER experiment in Camargue, France p 1070 N94-16691
Monitoring environmental state of Alaskan forests with AIRSAR p 1075 N94-16734
Comparison of modeled backscatter with SAR data at P-band p 1076 N94-16735

CANTILEVER BEAMS
On the design of structural components using materials with time-dependent properties [NASA-TM-108428] p 1059 N94-16519
Mechanical and surface force nanoprobe [AD-D015792] p 1034 N94-16536

CANYONS
A mineralized zone in Western Candor Chasma, Mars p 1248 N94-16179
AI-26 production profile and model comparisons in Canyon Diablo p 1245 N94-16409

CAPACITANCE
Steering capaciflector sensor [NASA-CASE-GSC-13489-1] p 1164 N94-15704
Capaciflector camera [NASA-CASE-GSC-13564-1] p 1033 N94-15872
Double-driven shield capacitive type proximity sensor [NASA-CASE-GSC-13541-1] p 1165 N94-15946
Determination of equivalent circuit for PVDF shock-pressure gauges [DE93-016492] p 1034 N94-16452
Temperature and pressure effects on capacitance probe cryogenic liquid level measurement accuracy [NASA-CR-190763] p 1034 N94-16521

CAPACITORS
Reliability characterization of digital microcircuits: Investigation of an in-process oxide reliability screening method [AD-A267053] p 1008 N94-15665
Forback DC-to-DC converter [NASA-CASE-GSC-13404-1] p 1010 N94-15874
Cyanoresin, cyanoresin/cellulose triacetate blends for thin film, dielectric capacitors [NASA-CASE-NPO-18913-1-CU] p 966 N94-15930
Cellulose triacetate, thin film dielectric capacitor [NASA-CASE-NPO-18935-1-CU] p 1010 N94-15952
Stray insensitive switched capacitor composite operational amplifiers [AD-A267412] p 1012 N94-16976
Plasma flow switch and foil implosion experiments on Pegasus 2 [DE93-016464] p 1013 N94-17318
Electrical properties of sol-gel PZT thin films for decoupling capacitor applications [DE93-016491] p 1015 N94-17648

CAPE KENNEDY LAUNCH COMPLEX
Identifying and responding to customer needs at the Kennedy Space Center p 1056 N94-16626
Bloodborne Pathogens Program p 1127 N94-16644

CAPILLARY FLOW
Neuropeptide-Y (NPY) increases total blood flow in the tail, and reduces cutaneous microvascular blood flow in the tail and foot of the rat [AD-A266839] p 1115 N94-14918
Characterization of voids formed during liquid impregnation of nonwoven multifilament glass networks as related to composite processing p 939 N94-16858

CAPILLARY TUBES
Evaporation from a meniscus within a capillary tube in microgravity [NASA-CR-194593] p 976 N94-15654

CAPTURE EFFECT
Multiple process simulations for correction factor calculations in experiments with neutrons. LUSMK program [DE93-623957] p 1179 N94-14932

CARBIDES
Interface chemistry in ceramic matrix composites [AD-A268629] p 973 N94-17466

CARBON
Simulation studies for surfaces and materials strength [NASA-CR-193387] p 1056 N94-15004
Negative ion formation in small carbon clusters [DE93-015436] p 1182 N94-16064
Euromet Ureilite Consortium: A preliminary report on carbon and nitrogen geochemistry p 1241 N94-16192
Carbon abundances, major element chemistry, and mineralogy of hydrated interplanetary dust particles p 1243 N94-16309
Water adsorption on diamond (110) studied by multiple internal reflection infrared spectroscopy [AD-A266415] p 948 N94-16553
The role of carbon and temperature in determining electrical conductivity of basins, crust and mantle [DE93-015936] p 1101 N94-16840
Single crystal diamond thin films [AD-A266457] p 1214 N94-17216

CARBON CYCLE
AIRSAR South American deployment: Operation plan, version 3.0 p 994 N94-15919

CARBON DIOXIDE
Density and temperature relaxation near the critical point of carbon dioxide under reduced gravity p 944 N94-15164
Analysis of leading edge and trailing edge cover glass samples before and after treatment with advanced satellite contamination removal techniques [AD-A267055] p 885 N94-15666
New York MARKAL: An evaluation of carbon dioxide emission control strategies in New York State [DE93-013149] p 1095 N94-15999
Statement on global climate change before the Subcommittee on Energy and Power, United States House of Representatives [DE93-013163] p 1095 N94-16006
Extraction and isotopic analysis of medium molecular weight hydrocarbons from Murchison using supercritical carbon dioxide p 1241 N94-16184
Nitrates in SNCs: Implications for the nitrogen cycle on Mars p 1251 N94-16193
Modeling the reflectance of CO2 frost with new optical constants: Application to Martian south polar cap spectra p 1256 N94-16217
Experimental constraints on CO2 and H2O in the Martian mantle and primary magmas p 1262 N94-16248
Removal of carbonaceous contaminants from silica aerogel p 953 N94-16256
Martian carbon dioxide: Clues from isotopes in SNC meteorites p 1270 N94-16295
Far-infrared spectra of CO2 clathrate hydrate frosts p 954 N94-16340
Earth's partial pressure of CO2 over the past 120 Ma; evidence from Ce anomalies in the deep (greater than 600 m) Pacific Ocean, 1 p 1104 N94-16358
Earth's partial pressure of CO2 over the past 100-500 Ma; evidence from Ce anomalies in mostly shallow seas (less than 200 m) as recorded in carbonate sediments, 2 p 1104 N94-16360
CO2 production by impact in carbonates? An ATEM and stable isotope (C,O) study p 954 N94-16383
Investigation of cloud properties and atmospheric stability with MODIS [NASA-CR-193475] p 1107 N94-16717
Binding of carbon dioxide to metal macrocycles: Toward a mechanistic understanding of electrochemical and photochemical carbon dioxide reduction [DE93-016244] p 949 N94-16870
Incorporating global warming risks in power sector planning. Volume 1: A case study of the New England region [DE93-015241] p 1096 N94-17289
Automated data collection system for the TCM3 transcutaneous pO2/pCO2 monitoring system [AD-A268400] p 1129 N94-17424
Strategy for the reduction of total integrated fluid logistics to the Space Station Freedom [NASA-TM-107744] p 1138 N94-17452

CARBON DIOXIDE CONCENTRATION
Projections of future CO2 [NIWA/ATMOS/R/93-001] p 1094 N94-15185

CARBON DIOXIDE LASERS
Heat shock protein induction in human cells by CO2 laser irradiation [AD-A266430] p 1117 N94-16545
Controlling chaotic behavior in CO2 and other lasers [AD-A266431] p 1040 N94-16546
Experimental studies on a gas dynamic laser with narrow throat and high area-ratio grid nozzles [AD-A267818] p 1042 N94-17400
Three short articles from Japanese laser journal [AD-A268249] p 1042 N94-17415
Laser ignition of solid propellants: 1. Ignition delays [AD-A268454] p 976 N94-17538

CARBON FIBER REINFORCED PLASTICS
Polymer Infiltration Studies [NASA-CR-194494] p 932 N94-15275
Effect of Impact Damage and Open Hole on Compressive Strength of Hybrid Composite Laminates [NASA-CR-194603] p 936 N94-16836
Low and high velocity impact response of thick hybrid composites p 936 N94-16837

CARBON FIBERS
Polymer Infiltration Studies [NASA-CR-194494] p 932 N94-15275
Processing, properties and applications of composites using powder-coated epoxy towpreg technology p 933 N94-15277

Carbon-carbon grid for ion engines
[NASA-CASE-NPO-19174-1-CU] p 925 N94-15876
Continuous fabrication of SiC fiber tows by chemical vapor deposition
[AD-A266460] p 936 N94-16569
Production and application of chemical fibers with special properties for manufacturing composite materials and goods of different usage p 938 N94-16854
Fibers and materials of medical application p 938 N94-16855
Fiber strength utilization in carbon/carbon composites
[AD-A267713] p 940 N94-17271
Interface chemistry in ceramic matrix composites
[AD-A268629] p 973 N94-17466

CARBON ISOTOPES
Euromet Ureilite Consortium: A preliminary report on carbon and nitrogen geochemistry p 1241 N94-16192
CO2 production by impact in carbonates? An ATEM and stable isotope (C,O) study p 954 N94-16383

CARBON MONOXIDE
Preconversion catalytic deoxygenation of phenolic functional groups
[DE93-017034] p 950 N94-16912

CARBON MONOXIDE LASERS
Three short articles from Japanese laser journal
[AD-A268249] p 1042 N94-17415

CARBON STEELS
Robotic weld overlay coatings for erosion control
[DE93-016938] p 970 N94-16959

CARBON 13
Do SiC grains in Orgueil differ from those in Murchison? p 1242 N94-16260
Design of a formaldehyde photodissociation process for carbon and oxygen isotope separation
[DE93-016435] p 1039 N94-16450

CARBON-CARBON COMPOSITES
Carbon-carbon grid for ion engines
[NASA-CASE-NPO-19174-1-CU] p 925 N94-15876
The processing and mechanical properties of high temperature/high performance composites. Book 2: Coonstituent properties and macroscopic performance
[AD-A266395] p 935 N94-16484
Fiber strength utilization in carbon/carbon composites
[AD-A267713] p 940 N94-17271
Thermo-mechanical analysis of oxidation protected carbon-carbon composites
[AD-A268191] p 941 N94-17597

CARBONACEOUS CHONDRITES
Comparison of reflectance spectra of C asteroids and unique C chondrites Y86720, Y82162, and B7904 p 1242 N94-16246
Phase equilibria of the magnesium sulfate-water system to 4 kbars p 953 N94-16247
Olivines in the Kaba carbonaceous chondrite and constraints on their formation p 1219 N94-16255
Different radiation and metamorphic history of the Kainsaz CO 3.2 chondrules p 1243 N94-16296
Cat Mountain: A meteoritic sample of an impact-melted chondritic asteroid p 1244 N94-16328
The astrophysical interpretation of isotope anomalies in graphite and SiC grains of chondrites p 1244 N94-16343
On origin of the olivine inclusions from the Kainsaz CO carbonaceous chondrite p 1244 N94-16345
INAA of CAIs from the Maralinga CK4 chondrite: Effects of parent body thermal metamorphism p 1244 N94-16355
Possible sources of H2 to H2O enrichment at evaporation of parent chondritic material p 1244 N94-16377
A hydrogen isotope study of CO3 type carbonaceous chondrites; comparison with type 3 ordinary chondrites p 1246 N94-16425
The spectrum of Phobos from Phobos 2 observations at 0.3-2.6 microns: Comparison to previous data and meteorite analogs p 1295 N94-16429

CARBONACEOUS METEORITES
Complex radiation-thermal history of Kaidun meteorite on data of track study of silicate minerals p 1243 N94-16297

CARBONATES
Partitioning of Nb, Mo, Ba, Ce, Pb, Th and U between immiscible carbonate and silicate liquids: Evaluating the effects of P2O5,F, and carbonate composition p 953 N94-16283
Crustal structure and igneous processes in a chondritic Io p 1243 N94-16292
Earth's partial pressure of CO2 over the past 120 Ma; evidence from Ce anomalies in the deep (greater than 600 m) Pacific Ocean, 1 p 1104 N94-16358
CO2 production by impact in carbonates? An ATEM and stable isotope (C,O) study p 954 N94-16383
Status of molten carbonate fuel cell technology development
[DE93-015666] p 1092 N94-16715

CARBONIZATION
Fiber strength utilization in carbon/carbon composites
[AD-A267713] p 940 N94-17271

CARBONYL COMPOUNDS
Synthesis, reactivity, and characterization of (-hexacarbocyclic) manganese dicarbonyl complexes with sulfur and phosphorus ligands
[AD-A267592] p 930 N94-17192

CARBOXYL GROUP
Synthesis, characterization, and polymerization of new ferrocene-fluorene complexes. A novel high-molecular weight conjugated polymer with pendant ferrocene groups
[AD-A267717] p 972 N94-17273

CARDIOVASCULAR SYSTEM
A mathematical model for the study of hemorrhagic shock and fluid resuscitation: The systemic and pulmonary vasculature
[AD-A266835] p 1119 N94-14917
Neuropeptide-Y (NPY) increases total blood flow in the tail, and reduces cutaneous microvascular blood flow in the tail and foot of the rat
[AD-A266839] p 1115 N94-14918
Increased vascular resistance with hemoglobin-based oxygen carriers
[AD-A266454] p 1123 N94-16565
The Goddard Space Flight Center ergonomics program p 1125 N94-16621
Efficient management of cardiovascular risk screening programs p 1125 N94-16622
Illness/injury pattern complex 40 (Titan) p 1125 N94-16625
Melatonin, the pineal gland, and circadian rhythms
[AD-A268200] p 1129 N94-17478

CARGO SPACECRAFT
Space transfer concepts and analyses for exploration missions, phase 4
[NASA-CR-193849] p 882 N94-15831

CAROTENE
Tracking photosynthetic efficiency with narrow-band spectroradiometry
[CIW-PUBL-1133] p 1072 N94-16698

CARRIER INJECTION
Nonstationary behaviour of low background photon detectors p 902 N94-15049

CARTESIAN COORDINATES
Adaptive Cartesian grid methods for representing geometry in inviscid compressible flow
[DE93-016430] p 1025 N94-16894
A review of some dynamics models in six-dimensional phase space and their suitable conditions of motion equation
[DE93-623741] p 1175 N94-17317

CARTRIDGES
Thermal spray forming of refractory sample ampoule cartridges for single crystal growth space furnaces
[TABES PAPER 93-605] p 1051 N94-16141

CASCADE FLOW
Advanced methods for cascade testing
[AGARD-AG-328] p 1016 N94-15119
Heat transfer and aerodynamics of a 3D design nozzle guide vane tested in the Pyestock isentropic light piston facility
[RAE-TM-AERO/PROP-19] p 856 N94-15696
Effect of wind tunnel acoustic modes on linear oscillating cascade aerodynamics
[NASA-TM-106367] p 869 N94-15866
Determining the effect of endwall boundary layer suction in a large scale subsonic compressor cascade
[AD-A267208] p 859 N94-16913

CASCADE WIND TUNNELS
Effect of wind tunnel acoustic modes on linear oscillating cascade aerodynamics
[NASA-TM-106367] p 869 N94-15866

CASE HISTORIES
Lift-fan aircraft: Lessons learned-the pilot's perspective
[NASA-CR-177620] p 867 N94-15950

CASSEGRAIN OPTICS
Matera Laser Ranging Observatory (MLRO): An overview p 877 N94-15601

CASSINI MISSION
Life and the solar system: The CRAF and Cassini missions
[NASA-TM-109422] p 1247 N94-15513

CAST ALLOYS
Aircraft carrier exposure tests of cast magnesium alloys
[AD-A268260] p 962 N94-17418

CASTING
STS-27 crew fire training and glove molding
[NASA-TM-109554] p 1136 N94-15406
Method of producing a silicon carbide fiber reinforced strontium aluminosilicate glass-ceramic matrix composite
[NASA-CASE-LEW-15263-2] p 934 N94-15929
Cellulose triacetate, thin film dielectric capacitor
[NASA-CASE-NPO-18935-1-CU] p 1010 N94-15952
Aluminum-lithium technology
[TABES PAPER 93-601] p 962 N94-16137
Fabrication of advanced design (grooved) cermet anodes
[DE93-014590] p 1012 N94-16765
Solid lubricants for space structures, phase 2
[AD-A266653] p 968 N94-16767
Techniques for preparation of ingot metallurgical discontinuous composites
[AD-D015748] p 940 N94-16933
X ray computed tomography for casting demonstration
[AD-A268084] p 1056 N94-17596

CASTINGS
X ray computed tomography for casting demonstration
[AD-A268084] p 1056 N94-17596

CATALOGS (PUBLICATIONS)
Satellite situation report, volume 33, no. 3
[NASA-TM-109278] p 885 N94-15712
Defense Logistics Information System (DLIS) procedures manual. Products and services end-user manual
[AD-A267766] p 1232 N94-17007
Satellite situation report, volume 31, number 1
[NASA-TM-105088] p 898 N94-17584

CATALYSIS
Catalytic crystallization of ices by small silicate smokes at temperatures less than 20K p 1219 N94-16420
Synthetic and mechanistic investigation of olefin polymerization catalyzed by early transition metal compounds
[DE93-018301] p 970 N94-16963
Methyl chloride via oxyhydrochlorination of methane
[DE93-017548] p 952 N94-17218

CATALYSTS
Intramolecular versus intermolecular condensation rates in the acidic polymerization of octaethoxytrisiloxane
[AD-A266982] p 963 N94-15490
Direct catalytic decomposition of nitric oxide
[DE93-016689] p 949 N94-16896
Development of vanadium-phosphate catalysts for methanol production by selective oxidation of methane
[DE93-016850] p 949 N94-16897
High octane ethers from synthesis gas-derived alcohols
[DE93-016861] p 975 N94-16898
Preconversion catalytic deoxygenation of phenolic functional groups
[DE93-017034] p 950 N94-16912
Transient studies of low temperature catalysts for methane conversion
[DE93-017710] p 950 N94-16962
Synthetic and mechanistic investigation of olefin polymerization catalyzed by early transition metal compounds
[DE93-018301] p 970 N94-16963
Methyl chloride via oxyhydrochlorination of methane
[DE93-017548] p 952 N94-17218

CATALYTIC ACTIVITY
Preconversion catalytic deoxygenation of phenolic functional groups
[DE93-017034] p 950 N94-16912

CATASTROPHE THEORY
Flutter analysis using transversality theory
[NASA-TM-106382] p 1062 N94-17481

CATHETERIZATION
Methods to obtain blood samples periodically during exercise research studies while subjects are immersed in water or otherwise inaccessible
[AD-A268227] p 1130 N94-17562

CATHODE RAY TUBES
Preparation and investigation of improved low voltage electron excitable phosphors
[AD-A266852] p 963 N94-14948

CATHODES
Status of molten carbonate fuel cell technology development
[DE93-015666] p 1092 N94-16715
Investigation of the energy distribution of ions, striking the cathode in an abnormal glow discharge
[DE93-623987] p 1013 N94-17316
Electron reversal ionizer for detection of trace species using a spherical cathode
[NASA-CASE-NPO-18870-1-CU] p 1185 N94-17329
RF vacuum microelectronics
[AD-A268399] p 1014 N94-17423
Cathode sheath charge transfer effects
[AD-A268393] p 1186 N94-17536

CATHODOLUMINESCENCE
Experimentally reproduced relict enstatite in porphyritic chondrules of enstatite chondrite composition p 1244 N94-16363
Nitride semiconductors for ultraviolet detection
[AD-A267877] p 1012 N94-17040

CATIONS
NMR and theoretical investigation of cation binding with sol-gel silicates
[AD-A266999] p 963 N94-15631
Vacancy condensation as the precursor to passivity breakdown
[DE93-012925] p 956 N94-15998
The Fe2(+)-Mg interdiffusion in orthopyroxene: Constraints from cation ordering and structural data and implications for cooling rates of meteorites
p 1241 N94-16175
Cation ordering in orthopyroxenes and cooling rates of meteorites: Low temperature cooling rates of Estherville, Bondoc and Shaw p 1241 N94-16176
Direct catalytic decomposition of nitric oxide
[DE93-016689] p 949 N94-16896
CATS
Evaluation of putative neurochemical intermediaries in space/motion sickness
[NASA-CR-193607] p 1118 N94-17090
CAVITATION FLOW
Application of thermal spray and ceramic coatings and reinforced epoxy for cavitation damage repair of hydroelectric turbines and pumps
[AD-A267624] p 971 N94-17198
CAVITIES
Selected computations of transonic cavity flows
p 858 N94-16511
Unsteady fluid and optical simulation of transonic aero-windows
[AIAA PAPER 93-3017] p 858 N94-16512
Computation of a controlled store separation from a cavity p 858 N94-16513
Advanced transport systems for electron beams in high brightness accelerators and FELs
[AD-A267322] p 1041 N94-17001
Quantum phase fluctuations in the Jaynes-Cummings model: Effects of cavity damping
[DE93-627984] p 1186 N94-17612
CAVITY FLOW
Computation of the Fluid and Optical Fields About the Stratospheric Observatory for Infrared Astronomy (SOFIA) and the Coupling of Fluids, Dynamics, and Control Laws on Parallel Computers
[NASA-CR-193168] p 858 N94-16510
Selected computations of transonic cavity flows
p 858 N94-16511
Unsteady fluid and optical simulation of transonic aero-windows
[AIAA PAPER 93-3017] p 858 N94-16512
On solving the compressible Navier-Stokes equations for unsteady flows at very low Mach numbers
[NASA-TM-106380] p 1027 N94-17128
An investigation of oblique shock/boundary layer interaction control
[AD-A268106] p 861 N94-17574
CAVITY RESONATORS
Quantum phase fluctuations in the Jaynes-Cummings model: Effects of cavity damping
[DE93-627984] p 1186 N94-17612
CD-ROM
The planetary data system educational CD-ROM
p 1234 N94-16209
CEILINGS (METEOROLOGY)
A comparison of ceiling and visibility observation for NWS manned observation sites and ASOS sites
[AD-A268356] p 1108 N94-17459
CELESTIAL MECHANICS
Total solar eclipse of 3 November 1994
[NASA-RP-1318] p 1236 N94-15481
Mapping the stability region of the 3:2 Neptune-Pluto resonance p 1280 N94-16351
Energy potential analysis of zero velocity curves in the restricted three-body problem
[AD-A267512] p 1170 N94-17076
AMIGAU: A prototype tool aimed at mission analysis for satellites and satellite constellations
p 888 N94-17133
CELL DIVISION
Bioeffects of radiofrequency radiation on cell growth and differentation. Volume 1: Engineering considerations
[AD-A267754] p 1118 N94-17232
CELL MEMBRANES (BIOLOGY)
Factors determining the release of nitric oxide --- Calcium/cadmium transport by renal cortical collectin duct cells
[AD-A266232] p 1118 N94-17224
CELLS (BIOLOGY)
The role of constitutive and inducible processes in the response of human squamous cell carcinoma cell lines to ionizing radiation
[DE93-015150] p 1129 N94-16970
Factors determining the release of nitric oxide --- Calcium/cadmium transport by renal cortical collectin duct cells
[AD-A266232] p 1118 N94-17224
Bioeffects of radiofrequency radiation on cell growth and differentation. Volume 1: Engineering considerations
[AD-A267754] p 1118 N94-17232
CELLULOSE
Cyanoresin, cyanoresin/cellulose triacetate blends for thin film, dielectric capacitors
[NASA-CASE-NPO-18913-1-CU] p 966 N94-15930
Cellulose triacetate, thin film dielectric capacitor
[NASA-CASE-NPO-18935-1-CU] p 1010 N94-15952
CEMENTS
Mechanical properties of magnesium ammonium phosphate cements and their zeolite composites
[DE93-015155] p 934 N94-16057
Influence of the loading rate on the endurance and deformability of cement matrix composites
[IFTR-1/1992] p 1060 N94-17052
CENTER OF MASS
ETALON-1,-2 center of mass correction and array reflectivity p 915 N94-15576
A feasibility study of a microgravity enhancement system for Space Station Freedom
[NASA-CR-191550] p 886 N94-15864
CENTRAL AMERICA
The Central American cold surge: An observational analysis of the deep southward penetration of North American cold fronts
[AD-A268592] p 1110 N94-17607
CENTRAL NERVOUS SYSTEM
Neurotoxicity of hemoglobin in cortical cell culture
[AD-A266506] p 1128 N94-16786
Human central nervous system oxygen toxicity data from 1945 to 1986
[AD-A268225] p 1130 N94-17556
CENTRAL PROCESSING UNITS
A microprocessor controller for a towing tank drive and flow visualisation system
[AD-A267087] p 872 N94-15543
Space systems environmental interaction studies
[AD-A267280] p 897 N94-17240
CENTRIFUGAL COMPRESSORS
Development of the seeding system used for laser velocimeter surveys of the NASA Low-Speed Centrifugal Compressor flow field
[NASA-TM-4485] p 1032 N94-15445
Experimental and computational investigation of the NASA low-speed centrifugal compressor flow field
[NASA-TM-4481] p 869 N94-17386
CENTROIDS
Effects of window size and shape on accuracy of subpixel centroid estimation of target images
[NASA-TP-3331] p 1034 N94-15990
CEPHEUS CONSTELLATION
The chromosphere of VV cephei and the distribution of circumstellar dust around red giants and supergiants
[NASA-CR-193594] p 1297 N94-16866
CERAMIC COATINGS
Application of thermal spray and ceramic coatings and reinforced epoxy for cavitation damage repair of hydroelectric turbines and pumps
[AD-A267624] p 971 N94-17198
Ceramic fiber coatings development and demonstration
[AD-A267286] p 972 N94-17242
CERAMIC FIBERS
Continuous fabrication of SiC fiber tows by chemical vapor deposition
[AD-A266460] p 936 N94-16569
Fabrication of piezoelectric ceramic/polymer composites by injection molding
[AD-A267302] p 972 N94-17227
Ceramic fiber coatings development and demonstration
[AD-A267286] p 972 N94-17242
CERAMIC MATRIX COMPOSITES
High temperature advanced structural composites. Volume 2: Ceramic matrix composites, fiber processiing and properties, and interfaces
[AD-A267023] p 933 N94-15528
High temperature advanced structural composites. Volume 3: Mechanics
[AD-A267024] p 933 N94-15626
High temperature advanced structural composites. Volume 1: Executive summary and intermetallic compounds
[AD-A267022] p 933 N94-15835
Method of producing a silicon carbide fiber reinforced strontium aluminosilicate glass-ceramic matrix composite
[NASA-CASE-LEW-15263-2] p 934 N94-15929
Modeling the thermal conductivity of fiber-reinforced ceramic composites
[DE93-015340] p 934 N94-16017
Overview of chemical vapor infiltration
[DE93-015440] p 934 N94-16065
Environmental effects on elevated temperature subcritical crack growth of SiC/SiC composites
[DE93-015688] p 934 N94-16158
Evaluation of the interfacial mechanical properties in fiber-reinforced ceramic composites
[DE93-015494] p 935 N94-16461
The processing and mechanical properties of high temperature/high performance composites. Book 1: Coonstituent properties of composites
[AD-A266394] p 935 N94-16483
The processing and mechanical properties of high temperature/high performance composites. Book 2: Coonstituent properties and macroscopic performance
[AD-A266395] p 935 N94-16484
The processing and mechanical properties of high temperature/high performance composites. Book 3: Coonstituent properties and macroscopic performance
[AD-A266396] p 935 N94-16485
The processing and mechanical properties of high temperature/high performance composites. Book 4: Coonstitutive laws and design
[AD-A266397] p 935 N94-16528
Transformation toughening of composite ceramics
[AD-A267304] p 971 N94-16980
Micromechanisms of monotonic and cyclic subcritical crack growth in advanced high melting point low-ductility intermetallics
[AD-A267764] p 961 N94-17223
Ceramic fiber coatings development and demonstration
[AD-A267286] p 972 N94-17242
Evaluation of interfacial properties of fiber-reinforced ceramic composites using fiber push-in tests
[DE93-015427] p 972 N94-17253
Direct observation of fracture of CAS-glass/SiC composites and processing of toughened alumina
[AD-A268275] p 941 N94-17457
Interface chemistry in ceramic matrix composites
[AD-A268629] p 973 N94-17466
CERAMICS
Remelting of Fe-C-Si-alloy in a ceramic mold skin
p 945 N94-15169
Self-diffusion coefficients of sol-gel intermediates
[AD-A266957] p 963 N94-15179
The friction and wear of ceramic/ceramic and ceramic/metal combinations in sliding contact
[NASA-TM-106348] p 930 N94-15769
Production and evaluation of dense ceramic compounds by combustion synthesis and dynamic compaction
[AD-A266742] p 965 N94-15773
Gas separations using ceramic membranes
[DE93-000278] p 947 N94-15861
Nonaqueous slip casting of high temperature ceramic superconductors using an investment casting technique
[NASA-CASE-LAR-14918-1] p 983 N94-15881
Synthesis of ceramic oxide powders in a microwave plasma device
[DE93-012741] p 965 N94-15920
The influence of microstructure on the mechanical behavior of silicon nitride ceramics
[DE93-015363] p 966 N94-16018
Multiaxial deformation and life prediction model and experimental data for advanced silicon nitride ceramics
[DE93-015450] p 967 N94-16067
Use of microgravity in the synthesis of ceramics using sol gel techniques p 979 N94-16088
Finite element analytical techniques for ceramic production in microgravity: A hypoelastic model
p 981 N94-16099
Thermal spray forming of refractory sample ampoule cartridges for single crystal growth space furnaces
[TABES PAPER 93-605] p 1051 N94-16141
Continuous fabrication of SiC fiber tows by chemical vapor deposition
[AD-A266460] p 936 N94-16569
Detection of subsurface defects in machined silicon nitride ceramics by optical scattering methods
[DE93-015554] p 968 N94-16658
Ablation, surface activation, and electroless metallization of insulating materials by pulsed excimer laser irradiation
[DE93-015808] p 1040 N94-16664
Development of a constitutive model for creep and life prediction of advanced silicon nitride ceramics
[DE93-015894] p 968 N94-16813
The Ceramic Technology Project: Ten years of progress
[DE93-015991] p 968 N94-16843
Superconducting ceramics: Selected properties and methods of production
[IFTR-23/1991] p 969 N94-16924
High temperature materials technology research for advanced thermionic systems
[DE93-018302] p 960 N94-16964
Transformation toughening of composite ceramics
[AD-A267304] p 971 N94-16980
Fabrication of piezoelectric ceramic/polymer composites by injection molding
[AD-A267302] p 972 N94-17227

Dynamic testing and characterization of pre-fractured ceramic
[DE93-016457] p 972 N94-17238
High temperature deformation behavior of YBa2Cu3O(6+x) superconducting ceramic materials
[AD-A268164] p 973 N94-17430
Investigations of YBaCuO materials with near-room-temperature resistivity transitions
[AD-A268016] p 1216 N94-17477
Oxygen diffusion in YBa2Cu3O(6+delta) ceramics on heating
[DE93-629161] p 974 N94-17633
Influence of the granular surface on the oxygen uptake in YBa2Cu3O(6+delta) ceramics
[DE93-629162] p 974 N94-17634

CEREBRAL CORTEX
Neurotoxicity of hemoglobin in cortical cell culture
[AD-A266506] p 1128 N94-16786

CEREBROSPINAL FLUID
Diffusible driving and coupling signals of the biological clock
[AD-A267046] p 1121 N94-15660
Evaluation of putative neurochemical intermediaries in space/motion sickness
[NASA-CR-193607] p 1118 N94-17090

CEREBRUM
Cumulative effect of repeated brief cerebral ischemia
[AD-A267155] p 1121 N94-15736

CERENKOV COUNTERS
Contained (nu) events observed in Soudan 2
[DE93-015548] p 1300 N94-17233

CERENKOV RADIATION
Contained (nu) events observed in Soudan 2
[DE93-015548] p 1300 N94-17233

CERIUM COMPOUNDS
Scintillation mechanism in stoichiometric cerium compounds
[DE93-015499] p 948 N94-16771

CERMETS
Production and evaluation of dense ceramic compounds by combustion synthesis and dynamic compaction
[AD-A266742] p 965 N94-15773
Chemical interactions between interconnect and electrode materials during sintering in solid oxide fuel cells
[DE93-015696] p 1092 N94-16160
Fabrication of advanced design (grooved) cermet anodes
[DE93-014590] p 1012 N94-16765

CERTIFICATION
Development of a proposed international standard for certification of aircraft to High Intensity Radiated Fields (HIRF)
[NASA-TM-106357] p 863 N94-16520
Windshear database for forward-looking systems certification
[NASA-TM-109012] p 1108 N94-17283

CESIUM
Earth's partial pressure of CO2 over the past 120 Ma; evidence from Ce anomalies in the deep (greater than 600 m) Pacific Ocean, 1 p 1104 N94-16358
Earth's partial pressure of CO2 over the past 100-500 Ma; evidence from Ce anomalies in mostly shallow seas (less than 200 m) as recorded in carbonate sediments, 2 p 1104 N94-16360

CETYL COMPOUNDS
Encapsulation of hemoglobin in non-phospholipid vesicles
[AD-A266505] p 1128 N94-16785

CHALCOGENIDES
Lead chalcogenides based IR photosensitive array detectors with coordinate addressing p 903 N94-15053
A linear monolithic 4-6 on silicon IR detector array p 910 N94-15098

CHALLENGER (ORBITER)
The 1982 highlights
[NASA-TM-109671] p 1303 N94-15508

CHANNEL CAPACITY
Bandwidth efficient coding: Theoretical limits and real achievements. Error control techniques for satellite and space communications p 997 N94-16507

CHANNEL FLOW
Modal element method for potential flow in non-uniform ducts: Combining closed form analysis with CFD
[NASA-TM-106347] p 1169 N94-15799
Three-dimensional turbulent boundary layer
[AD-A266261] p 1025 N94-16908
The stability and dynamics of elastic structures and fluid flows
[AD-A267990] p 1029 N94-17414

CHANNEL NOISE
Lossless compression of AVIRIS data: Comparison of methods and instrument constraints p 1075 N94-16713

CHANNELS
Channel of the system for pulse charged particle beam diagnostics
[DE93-623867] p 1179 N94-14931

CHANNELS (DATA TRANSMISSION)
A software interface for the ARL wind tunnel data acquisition system
[AD-A267114] p 1146 N94-15650
A simulation study of the performance of the NASA (2,1,6) convolutional code on RFI/burst channels p 997 N94-16508
Search for optimal distance spectrum convolutional codes p 998 N94-16509
Using Markov chains to model the error behavior of data communications channels
[AD-A266468] p 999 N94-16777
Small satellite constellation system: Optimization criteria p 888 N94-17132
Strategy for a small satellite program and a proposal for a first mission p 874 N94-17143

CHAOS
Looking at Fokker-Planck dynamics with a noisy instrument
[AD-A267049] p 1117 N94-15662
Development of pattern recognition techniques for the evaluation of toxicant impacts to multispecies systems
[AD-A267197] p 1095 N94-15790
Real-time adaptive neural network data processing
[TABES PAPER 93-660] p 1054 N94-16155
Search for chaos in free shear flows
[AD-A266245] p 1023 N94-16470
Controlling chaotic behavior in CO2 and other lasers
[AD-A266431] p 1040 N94-16546
Stochastic chaos: An analog of quantum chaos
[DE93-016619] p 1220 N94-16956
Nonlinear methods for communications
[AD-A267376] p 1001 N94-17019
Extracavity frequency doubling study of a pulsed photodissociation iodine laser
[AD-A267893] p 1042 N94-17394

CHARACTER RECOGNITION
Freedom system Text and Graphics Systems (TAGS)
[NASA-TM-109509] p 1140 N94-15455

CHARACTERIZATION
Characterization facility for magneto-optic media and systems p 1226 N94-14983
Tessera terrain on Venus: Global characterization from Magellan data p 1264 N94-16262

CHARGE CARRIERS
A study of high field transport in wide band gap electronic materials using a picosecond transient charge technique
[AD-A267098] p 1008 N94-15636

CHARGE COUPLED DEVICES
Development of x ray CCDs p 900 N94-15033
The XMM pn-CCD detector system: First results p 900 N94-15034
The development of back-illuminated CCD's for XMM p 900 N94-15035
Thinned, backside illuminated, area CCD imager for electron detection p 901 N94-15036
The MIC photon counting detector p 901 N94-15039
CCDs and photon counting devices: Applications in space and from the ground p 901 N94-15041
Schottky barrier focal plane arrays for SWIR and MWIR p 903 N94-15050
A 12.5 micron infrared detector for Earth observation p 903 N94-15052
Developments in extreme ultraviolet and x ray instrumentation p 904 N94-15058
Radiation hardening of a CCD technology through process and design modifications p 906 N94-15071
CCD's on high resistivity bulk silicon for x ray spectroscopy on XMM p 907 N94-15080
Requirements on CCD-detectors for ground-based auroral imaging p 909 N94-15093
Assessment of TDI operation of a frame transfer CCD for high resolution imaging from a fast spinning spacecraft p 910 N94-15097
A conceptual design study for a two-dimensional, electronically scanned thinned array radiometer
[NASA-TM-109051] p 1085 N94-17665

CHARGE TRANSFER
Negative ion formation in small carbon clusters
[DE93-015436] p 1182 N94-16064
Iron oxide bands in the visible and near-infrared reflectance spectra of primitive asteroids p 1242 N94-16274
Structural effects in electron transfer reactions: Comparative interfacial electrochemical kinetics for cis- versus trans-dioxorhenium (V) (bi)pyridine oxidation
[AD-A266307] p 1182 N94-16466
Energy-loss cross sections for inclusive charge-exchange reactions at intermediate energies
[NASA-TM-4522] p 1188 N94-17018
Cathode sheath charge transfer effects
[AD-A268393] p 1186 N94-17536

CHARGED PARTICLES
Channel of the system for pulse charged particle beam diagnostics
[DE93-623867] p 1179 N94-14931
Investigation of the interactions of radiation with matter
[AD-A266743] p 1181 N94-15774
Confinement and stability of a Crystal Beam
[DE93-015400] p 1181 N94-16020
Inductive effects during second harmonic current drive experiments on T-10
[DE93-014411] p 1202 N94-16803
Study of brightness and current limitations in intense charged particle beams
[AD-A268283] p 1186 N94-17578

CHARM (PARTICLE PHYSICS)
Status of (alpha)(sub s) measurements
[DE93-015179] p 1181 N94-16059

CHARON
Mapping the stability region of the 3:2 Neptune-Pluto resonance p 1280 N94-16351

CHASSIGNITES
Nitrates in SNCs: Implications for the nitrogen cycle on Mars p 1251 N94-16193
Os isotopes in SNC meteorites and their implications to the early evolution of Mars and Earth p 1242 N94-16272
Martian carbon dioxide: Clues from isotopes in SNC meteorites p 1270 N94-16295

CHEBYSHEV APPROXIMATION
Fast algorithms for polynomial interpolation, integration and differentiation
[AD-A267505] p 1154 N94-17370

CHECKOUT
STS-37 astronauts Ross and Apt during CETA hardware checkout
[NASA-TM-109496] p 1137 N94-15460
Bench checkout equipment for spaceborne laser altimeter systems p 921 N94-15618
Galileo probe spacecraft mission to Jupiter
[NASA-TM-109646] p 1247 N94-16070

CHELATION
Vanadium corrosion studies
[AD-A266489] p 959 N94-16781

CHEMICAL ANALYSIS
Lasing dye sensor for chemical vapors
[AD-D015786] p 1040 N94-16533

CHEMICAL BONDS
The thermal dissociation of NH2CHO(ND2CHO) on Si(100)-2x1
[AD-A266903] p 942 N94-14956
Materials Research Society Symposium Proceedings, Volume 292: Biomolecular Materials
[AD-A265776] p 1116 N94-15138
NMR and theoretical investigation of cation binding with sol-gel silicates
[AD-A266999] p 963 N94-15631
Thermochemistry of silicate speciation in aqueous sodium silicate solutions: Ionization and polymerization of small silicate ion
[AD-A266825] p 964 N94-15683
Structural studies of sol-gel glasses
[AD-A266277] p 967 N94-16472

CHEMICAL COMPOSITION
Compounds containing meta-biphenylenedioxy moieties and polymers therefrom
[NASA-CASE-LAR-14517-1] p 965 N94-15879
An assessment of acid fog
[DE93-009347] p 1095 N94-15940
Systematic chemical variations in large 3AB iron meteorites: Clues to core crystallization p 1241 N94-16213
A Moessbauer spectrometer for the mineralogical analysis of the Mars surface: First temperature dependent tests of the detector and drive system p 1259 N94-16233
Thermal inertia and radar reflectivity of the Martian north polar ERG: Low-density aggregates p 1260 N94-16238
Chemical and isotopic compositions in acid residues from various meteorites p 1243 N94-16291
Carbon abundances, major element chemistry, and mineralogy of hydrated interplanetary dust particles p 1243 N94-16309
An initial perspective of S-asteroid subtypes within asteroid families p 1243 N94-16310
Terrestrial bitumen analogue of orgueil organic material demonstrates high sensitivity to usual HF-HCl treatment p 930 N94-16325
Composition of Apollo 17 core 76001 p 1275 N94-16326
Evolution of Triton's volatile budget p 1284 N94-16373

Effects of bulk composition on production rates of cosmogenic nuclides in meteorites p 1245 N94-16385
Composition of weakly altered Martian crust p 1296 N94-16436
Metastable phases in mechanically alloyed aluminum germanium powders
[DE93-008727] p 958 N94-16463
Method for doping GaAs with high vapor pressure elements
[AD-D015794] p 1210 N94-16538
First results from analysis of coordinated AVIRIS, TIMS, and ISM (French) data for the Ronda (Spain) and Beni Bousera (Morocco) peridotites p 1067 N94-16675
Advanced thermally stable jet fuels
[DE93-017711] p 975 N94-16996
Pseudomorphic semiconducting heterostructures from combinations of AlN, GaN and selected SiC polytypes: Theoretical advancement and its coordination with experimental studies of nucleation, growth, characterization and device deployment
[AD-A267561] p 1213 N94-17108

CHEMICAL EFFECTS
Analytical and experimental investigation of the feasibility of accelerated lifetime testing of materials exposed to an atomic oxygen beam
[NASA-CR-193851] p 946 N94-15766

CHEMICAL ELEMENTS
Elemental impurity analysis of mercuric iodide by ICP/MS
[DE93-015531] p 949 N94-16876

CHEMICAL ENGINEERING
Prioritization methodology for chemical replacement
[NASA-TP-3421] p 976 N94-15723

CHEMICAL EQUILIBRIUM
Large eddy simulation and direct numerical simulation of high speed turbulent reacting flows
[NASA-CR-193131] p 1018 N94-15427
Evaluation of hemoglobin-oxygen equilibrium binding by rapid-scanning spectrophotometry and singular-value decomposition
[AD-A266453] p 1123 N94-16564
Coefficients for calculating thermodynamic and transport properties of individual species
[NASA-TM-4513] p 1220 N94-17624

CHEMICAL EVOLUTION
Publications of the Exobiology Program for 1991: A special bibliography
[NASA-TM-4483] p 1139 N94-17017

CHEMICAL LASERS
Reactions of chemiluminescence induced by singlet oxygen with metals
[ONERA-NT-1992-13] p 955 N94-15149
Pulsed hydrogen fluoride overtone chemical laser studies
[AD-A267597] p 1041 N94-17193
Bibliography of short wavelength chemical laser research
[AD-A267619] p 1041 N94-17195

CHEMICAL PROPERTIES
Physical and chemical properties of some new perfluoropolyalkylether lubricants prepared by direct fluorination
[NASA-TM-106299] p 967 N94-16543
Continuum solvent models for computational chemistry
[DE93-016329] p 953 N94-17660

CHEMICAL PROPULSION
Emerging technologies for the changing global market
[TABES PAPER 93-612] p 930 N94-16144

CHEMICAL REACTIONS
A proposed mechanism for the pyrolysis of diborane
[DE93-014275] p 947 N94-15977
Study of fractal aggregates p 979 N94-16086
Single-collision studies of energy transfer and chemical reaction
[DE93-017603] p 1182 N94-16121
Chemical interactions between interconnect and electrode materials during sintering in solid oxide fuel cells
[DE93-015696] p 1092 N94-16160
Structural effects in electron transfer reactions: Comparative interfacial electrochemical kinetics for cis- versus trans-dioxorhenium (V) (bi)pyridine oxidation
[AD-A266307] p 1182 N94-16466
Characterization of UV emissions resulting from electronic energy transfer in atmospheric molecules
[AD-A266244] p 1101 N94-16469
Apparatus for and a method of growing thin films of elemental semiconductors
[AD-D015813] p 1210 N94-16487
Electrorheological fluid chemical processing
[AD-D015785] p 948 N94-16532
Evaluation of hemoglobin-oxygen equilibrium binding by rapid-scanning spectrophotometry and singular-value decomposition
[AD-A266453] p 1123 N94-16564
Dissociation rates of diatomic molecules
[AD-A266464] p 1182 N94-16586
Release of iron from hemoglobin
[AD-A266503] p 1128 N94-16784
Pulsed laser kinetic studies of liquids under high pressure
[DE93-017826] p 1041 N94-16998
Synthesis of potential high-energy fuels
[AD-A267508] p 975 N94-17073
Atmospheric ionization by solar particles detected by nitrate measurement in antarctic snow
[AD-A267583] p 1299 N94-17208
Studies on nonequilibrium phenomena in supersonic chemically reacting flows
[NASA-CR-194662] p 1027 N94-17215
Investigation of the origin of hot spots in deformed crystals: Ammonium perchlorate studies
[AD-A267692] p 1214 N94-17270
Interface chemistry in ceramic matrix composites
[AD-A268629] p 973 N94-17466
Soluble precursor route to polyanilines
[AD-A268015] p 973 N94-17494
Chemical reactions in turbulent mixing flows
[AD-A268287] p 861 N94-17580

CHEMICAL VAPOR INFILTRATION
NEXTEL(trademark)/SiC composites using forced chemical vapor infiltration
[DE93-013532] p 934 N94-16008
Overview of chemical vapor infiltration
[DE93-015440] p 934 N94-16065

CHEMICAL WARFARE
Trace analysis of chemical warfare agents in air: Sampling in porous polymers followed with thermal desorption analysis
[FOA-C-40302-4.6] p 1097 N94-17625

CHEMICALS
Prioritization methodology for chemical replacement
[NASA-TP-3421] p 976 N94-15723

CHEMILUMINESCENCE
Reactions of chemiluminescence induced by singlet oxygen with metals
[ONERA-NT-1992-13] p 955 N94-15149

CHEMISORPTION
Structural and dynamical aspects of electrodeposition
[AD-A266[illegible]] p 942 N94-14909
Water adsorption on diamond (110) studied by multiple internal reflection infrared spectroscopy
[AD-A266415] p 948 N94-16553
Atomic layer epitaxy group IV materials: Surface processes, thin films, devices and their characterization
[AD-A267527] p 1213 N94-17116

CHEMOTHERAPY
Evaluation of putative neurochemical intermediaries in space/motion sickness
[NASA-CR-193607] p 1118 N94-17090

CHICKENS
STS-29 crew with student experiment
[NASA-TM-109545] p 1116 N94-15378

CHILDREN
Short walk to everywhere --- Space, Earth, Ocean Center
[NASA-TM-109541] p 1221 N94-15372
Lead poisoning: An overview p 1124 N94-16614

CHIPS (ELECTRONICS)
Multichip module high speed testing
[AD-A266968] p 986 N94-14955
NASA Space Engineering Research Center for VLSI System Design
[NASA-CR-194587] p 1008 N94-15547
Reliability analysis of Surface Mount Technology (SMT)
[AD-A267598] p 1055 N94-17194
Leak detection utilizing analog binaural (VLSI) techniques
[NASA-CASE-NPO-18399-1-CU] p 1014 N94-17323
A high-speed object recognition chip based on a biologically-realistic hybrid temporal processing
[AD-A268270] p 1134 N94-17576
Low dielectric constant insulators and gold metallization for GHz multi-chip modules, part 2
[AD-A268590] p 1176 N94-17605

CHIRP SIGNALS
Spaceborne Imaging Radar-C instrument p 990 N94-15890

CHLORIDES
Thermal disorder in adsorbed Cl on Si(100)
[AD-A266295] p 1210 N94-16476
Stress corrosion cracking of 316 SS and Incoloy-800 in high temperature aqueous containing sulfate and chloride
[DE93-623325] p 952 N94-17302

CHLORINATION
Methyl chloride via oxyhydrochlorination of methane
[DE93-017548] p 952 N94-17218

CHLORINE COMPOUNDS
The photochemistry of poly(methylphenylphosphazene)
[AD-A267320] p 970 N94-16948

CHLOROCARBONS
Environmental management lessons to be learned from the upcoming CFC phase out or how to insure that we survive the next environmentally mandated process change
[TABES PAPER 93-570] p 1050 N94-16136

CHLOROFLUOROCARBONS
Environmental management lessons to be learned from the upcoming CFC phase out or how to insure that we survive the next environmentally mandated process change
[TABES PAPER 93-570] p 1050 N94-16136

CHLOROPHYLLS
Seasonal and spatial variations in phytoplanktonic chlorophyll in eutrophic Mono Lake, California, measured with the Airborne Visible and Infrared Imaging Spectrometer (AVIRIS) p 1069 N94-16684
Multiple dataset water-quality analyses in the vicinity of an ocean wastewater plume p 1069 N94-16687
Primary studies of trace quantities of green vegetation in Mono Lake area using 1990 AVIRIS data p 1071 N94-16695

CHOLESTEROL
Encapsulation of hemoglobin in non-phospholipid vesicles
[AD-A266505] p 1128 N94-16785

CHONDRITES
Grosnaja ABCs: Magnesium isotope compositions p 1241 N94-16191
Nd-142/Nd-144 in bulk planetary reservoirs, the problem of incomplete mixing of interstellar components and significance of very high precision Nd-145/Nd-144 measurements p 1256 N94-16220
Pyroxene equilibration temperatures in metamorphosed ordinary chondrites p 1242 N94-16224
Potassium isotope cosmochemistry, volatile depletion and the origin of the Earth p 953 N94-16259
First investigation of noble gases in the Dengli H3,8 chondrite p 953 N94-16264
Silica-bearing objects in the Dengli H3.8 and Gorlovka H3-4 chondrites p 1242 N94-16265
Transition metals in superheat melts p 962 N94-16273
Complex zoning behavior in pyroxene in FeO-rich chondrules in the Semarkona ordinary chondrite p 1243 N94-16284
Angrite LEW87051: Are the olivines pheno's or xeno's? A continuing story p 1103 N94-16285
Partial melting of ordinary chondrites: Lost City (H) and St. Severin (LL) p 1243 N94-16286
The Al Rais meteorite: A CR chondrite or close relative? p 1243 N94-16290
Crustal structure and igneous processes in a chondritic Io p 1243 N94-16292
Heterogeneous plagioclase compositions in the Maralinga CK4 chondrite p 1243 N94-16308
Comparative magnetic and thermoanalytical study of two enstatite chondrites: Adhi Kot and Atlanta p 1244 N94-16329
Chromite-rich mafic silicate chondrules in ordinary chondrites: Formation by impact melting p 1244 N94-16330
Chondritic ratios of Fe/Cr/Ir in Kerguelen Plateau (Hole 738C) K/T carbonate-rich sediments support asteroid-cometary impact at K/T time p 1244 N94-16357
Noble gases in twenty Yamato H-chondrites: Comparison with Allan Hills chondrites and modern falls p 1244 N94-16361
Experimentally reproduced relict enstatite in porphyritic chondrules of enstatite chondrite composition p 1244 N94-16363
Refractory precursor components in an Allende ferromagnesian chondrule p 1245 N94-16412
Identification of new meteorite, Mihonoseki (L), from broken fragments in Japan p 1246 N94-16415
Zaoyang chondrite cooling history from pyroxene Fe(2+)-Mg intracrystalline ordering and exolutions p 1246 N94-16417
Optical effects of regolith processes on S asteroids as simulated by laser impulse alteration of ordinary chondrite p 1246 N94-16422
Nitrogen and light noble gases in Parsa enstatite chondrite p 1246 N94-16435

CHONDRULE
Gas-grain energy transfer in solar nebula shock waves: Implications for the origin of chondrules p 1262 N94-16251
The group A3 chondrules of Krymka: Further evidence for major evaporative loss during the formation of chondrules p 1242 N94-16257

Complex zoning behavior in pyroxene in FeO-rich chondrules in the Semarkona ordinary chondrite
p 1243 N94-16284
Different radiation and metamorphic history of the Kainsaz CO 3.2 chondrules p 1243 N94-16296
Chromite-rich mafic silicate chondrules in ordinary chondrites: Formation by impact melting
p 1244 N94-16330
On origin of the olivine inclusions from the Kainsaz CO carbonaceous chondrite p 1244 N94-16345
Experimentally reproduced relict enstatite in porphyritic chondrules of enstatite chondrite composition
p 1244 N94-16363
Refractory precursor components in an Allende ferromagnesian chondrule p 1245 N94-16412

CHORDS (GEOMETRY)
Wind-tunnel investigation of aerodynamic efficiency of three planar elliptical wings with curvature of quarter-chord line
[NASA-TP-3359] p 859 N94-16574

CHROMATES
Assessment of chromate and non-chromate conversion coatings for Al alloys using electrochemical impedance spectroscopy
[AD-A267205] p 965 N94-15859

CHROMITES
Chemical interactions between interconnect and electrode materials during sintering in solid oxide fuel cells
[DE93-015696] p 1092 N94-16160
Low-temperature sintering and phase changes in chromite interconnect materials
[DE93-015676] p 961 N94-17234

CHROMIUM ALLOYS
In situ studies of passive film chemistry using x ray absorption spectroscopy
[DE93-014023] p 947 N94-16011
Effects of alloying and temperature on the high-temperature oxidation of Cr-Cr2Nb
[DE93-015800] p 957 N94-16163

CHROMIUM COMPOUNDS
Chromite-rich mafic silicate chondrules in ordinary chondrites: Formation by impact melting
p 1244 N94-16330

CHROMIUM OXIDES
Low-temperature sintering and phase changes in chromite interconnect materials
[DE93-015676] p 961 N94-17234

CHROMIUM STEELS
The effect of long-term aging on the impact properties of modified 9Cr-1Mo steel
[DE93-015453] p 957 N94-16068

CHROMOSPHERE
The chromosphere of VV cephei and the distribution of circumstellar dust around red giants and supergiants
[NASA-CR-193594] p 1297 N94-16866

CHRONIC CONDITIONS
Cool suit
[NASA-TM-109639] p 1120 N94-15250

CHRONOLOGY
Preliminary results of polarization signatures for glacial moraines in the Mono Basin, Eastern Sierra Nevada
p 1078 N94-16746

CIRCADIAN RHYTHMS
Diffusible driving and coupling signals of the biological clock
[AD-A267046] p 1121 N94-15660
TransRapid TR-07 maglev-spectrum magnetic field effects on daily pineal indoleamine metabolic rhythms in rodents
[DE93-015143] p 1117 N94-16893
Melatonin, the pineal gland, and circadian rhythms
[AD-A268200] p 1129 N94-17478

CIRCUIT DIAGRAMS
Circle diagram approach for self excited induction generators
[DE93-010031] p 1010 N94-15971

CIRCUIT RELIABILITY
Technology transfers and reliable oxides
[AD-A266948] p 1175 N94-15758

CIRCULAR CYLINDERS
Volume integral equations applied to circular and square cylinders
[AD-A266635] p 1169 N94-15785
Modal ring method for the scattering of sound
[NASA-TM-106342] p 1177 N94-16497

CIRRUS CLOUDS
Preliminary analysis of University of North Dakota aircraft data from the FIRE Cirrus IFO-2
[NASA-CR-193357] p 866 N94-15429
Separation of cirrus cloud from clear surface from AVIRIS data using the 1.38 micron water vapor band
p 1072 N94-16699

CIVIL AVIATION
US civil airmen statistics: Calendar year 1992
[AD-A267708] p 853 N94-14965
Symposium on the Future of Aeronautics in the Netherlands
[ETN-93-93780] p 853 N94-15120
Predicted and real development in the aviation in the period 1961-1991 p 853 N94-15122
The future of Schiphol: Growth within boundaries
p 853 N94-15123
Aviation inspection prospects p 853 N94-15125
Aviation and the KLM: Past and future
p 853 N94-15126
Expectations for the future of Fokker
p 854 N94-15127
Back to propellers
[NASA-TM-109445] p 869 N94-15344
Criminal acts against civil aviation, fiscal year 1992
[AD-A268014] p 863 N94-17586

CLASSICAL MECHANICS
Stability of flows in fluidized beds
[DE93-000245] p 1024 N94-16763

CLASSIFICATIONS
A browsing tool for the Internet Logical Library of the HPCC Software Exchange
[NASA-CR-194545] p 1143 N94-15189
A new method for generating Bayes classifiers assuming mixtures of Gaussian densities
[FFI-91/4029] p 1172 N94-15298
Multifrequency observations p 992 N94-15902
Lava flow-field morphological classification and interpretation: Examples from Venus
p 1259 N94-16230
The Al Rais meteorite: A CR chondrite or close relative? p 1243 N94-16290
The nature of dynamic arteriolar vasoreactivity: A mini-review and A classification scheme
[AD-A266499] p 1128 N94-16783

CLASSIFIERS
Acousto-optical classifier
[AD-D015894] p 1000 N94-16921

CLATHRATES
Far-infrared spectra of CO2 clathrate hydrate frosts
p 954 N94-16340

CLEAN ENERGY
Helium-3 inventory of lunar samples: A potential future energy resource for mankind? p 1295 N94-16428

CLEAN FUELS
Utility emissions associated with electric and hybrid vehicle (EHV) charging
[DE93-013734] p 1011 N94-16459

CLEANING
Polished substrate surface and cleaning study for coated optic quality
[DE93-014116] p 1190 N94-15975
Dry stripping as a surface treatment method
[VTT-TIED-1348] p 985 N94-17544

CLEARANCES
Soyuz/ACRV accommodation study
[NASA-TM-107733] p 888 N94-17072

CLEAVAGE
Bulk and defect properties of ordered intermetallics: A first-principles total-energy investigation
[DE93-015492] p 959 N94-16873

CLIMATE
IAI topic: El Nino. Southern oscillation and interannual climate variability
[INPE-5410-PRE/1757] p 1111 N94-15186
Global climate study
[NASA-TM-109612] p 1098 N94-15363
Exploring the southern ocean response to climate change
[NASA-CR-194601] p 1112 N94-15680
Research into the influence of spatial variability and scale on the parameterization of hydrological processes
[NASA-CR-194610] p 1082 N94-16026
Heterogeneity and scaling land-atmospheric water and energy fluxes in climate systems p 1083 N94-16030
Further development and testing of a second-order bulk boundary layer model
[AD-A268071] p 1109 N94-17552
Workshop on early Mars: How warm and how wet, part 2?
[NASA-CR-193503] p 1297 N94-17637
Boundary layer structure over areas of heterogeneous heat fluxes
[DE93-010657] p 1110 N94-17673

CLIMATE CHANGE
IAI topic: El Nino. Southern oscillation and interannual climate variability
[INPE-5410-PRE/1757] p 1111 N94-15186
Exploring the southern ocean response to climate change
[NASA-CR-194601] p 1112 N94-15680
Recent scientific advances in the use of radar in scientific hydrology p 991 N94-15895
Driving terrestrial ecosystem models from space
p 991 N94-15896
EOS SAR: A new approach p 992 N94-15904
A summary of microwave remote sensing investigations planned for BOREAS p 993 N94-15914
Statement on global climate change before the Subcommittee on Energy and Power, United States House of Representatives
[DE93-013163] p 1095 N94-16006
The effects of orbital and climatic variations on Martian surface heat flow p 1290 N94-16402
Global change research: Science and policy
[DE93-015675] p 1096 N94-16445
Discrimination among semi-arid landscape endmembers using the Spectral Angle Mapper (SAM) algorithm
p 1074 N94-16711
The use of General Circulation Models in detecting climate change induced by greenhouse gases
[DE93-014369] p 1096 N94-16802
Atmospheric ionization by solar particles detected by nitrate measurement in antarctic snow
[AD-A267583] p 1299 N94-17208
Incorporating global warming risks in power sector planning. Volume 1: A case study of the New England region
[DE93-015241] p 1096 N94-17289
Statistics and physical oceanography
[AD-A268565] p 1115 N94-17598
Surface energy balance modeling at mesoscale: The contribution of the future Earth observing system
[BCRS-91-04] p 1085 N94-17616

CLIMATOLOGY
Exploring the southern ocean response to climate change
[NASA-CR-194601] p 1112 N94-15680
Recent advances in radar remote sensing of forest
p 991 N94-15897
The effects of orbital and climatic variations on Martian surface heat flow p 1290 N94-16402
The use of General Circulation Models in detecting climate change induced by greenhouse gases
[DE93-014369] p 1096 N94-16802
Orographic microbursts in a severe winter windstorm
[AD-A267651] p 1108 N94-17247
Validation and analysis of microwave-derived rainfall over the tropics
[AD-A267785] p 1108 N94-17303
Further development and testing of a second-order bulk boundary layer model
[AD-A268071] p 1109 N94-17552
A two-layer quasi-geotrophic spherical model: Formulation and climatology
[DM-63] p 1110 N94-17593
Statistics and physical oceanography
[AD-A268565] p 1115 N94-17598
The Central American cold surge: An observational analysis of the deep southward penetration of North American cold fronts
[AD-A268592] p 1110 N94-17607
Workshop on early Mars: How warm and how wet, part 2?
[NASA-CR-193503] p 1297 N94-17637

CLIMBING FLIGHT
Trajectory optimization for the National Aerospace Plane
[NASA-CR-194618] p 867 N94-16498

CLINICAL MEDICINE
Living well in space: Clinical care challenge
[NASA-TM-109539] p 1120 N94-15370
Center of Excellence in Laser Medicine
[DE93-016541] p 1122 N94-16113
Tuberculosis: A case for increased screening
p 1126 N94-16627
Summary of follow-up results from potential tuberculosis exposures p 1126 N94-16628
Legionella: An overview p 1126 N94-16629

CLOCKS
Asynchronous design for parallel processing architectures
[AD-A266523] p 1160 N94-16791
Verification of fault-tolerant clock synchronization systems
[NASA-TP-3349] p 1161 N94-17449

CLOSED CYCLES
Some single-piston closed-cycle machines and Peter Tailer's thermal lag engine
[DE93-015983] p 1049 N94-17675

CLOSED ECOLOGICAL SYSTEMS
The dynamics of hydroponic crops for simulation studies of the CELSS initial reference configurations
[NASA-CR-194654] p 1118 N94-17279
Strategy for the reduction of total integrated fluid logistics to the Space Station Freedom
[NASA-TM-107744] p 1138 N94-17452

CLOUD COVER
Venus lightning
[NASA-TM-109644] p 1105 N94-15430
Simulation of AVHRR-K band ratios with AVIRIS
p 1075 N94-16714

Three dimensional visualization of GOES cloud data using OCTRESS
[AD-A268102] p 1109 N94-17572
The Central American cold surge: An observational analysis of the deep southward penetration of North American cold fronts
[AD-A268592] p 1110 N94-17607

CLOUD HEIGHT INDICATORS
An empirical study of tropical cloud clusters using special sensor microwave imager data
[AD-A268072] p 1110 N94-17595

CLOUD PHYSICS
A global traveling wave on Venus
[NASA-CR-194356] p 1246 N94-15182
Preliminary analysis of University of North Dakota aircraft data from the FIRE Cirrus IFO-2
[NASA-CR-193357] p 866 N94-15429
Investigation of cloud properties and atmospheric stability with MODIS
[NASA-CR-193475] p 1107 N94-16717

CLOUDS
Ground truth spectrometry and imagery of eruption clouds to maximize utility of satellite imagery
[NASA-CR-194358] p 1081 N94-15181
Clouding tracing: Visualization of the mixing of fluid elements in convection-diffusion systems
[NASA-CR-191529] p 1148 N94-15965

CLOUDS (METEOROLOGY)
A comparison of cloud attenuation models using measured cloud data p 996 N94-16044
Three dimensional visualization of GOES cloud data using OCTRESS
[AD-A268102] p 1109 N94-17572

CLUSTER ANALYSIS
Massively parallel, adaptive, color image processing for autonomous road following
[AD-A266988] p 864 N94-15498

CLUTTER
Designing clutter rejection filters with complex coefficients for airborne pulsed Doppler weather radar
[NASA-CR-4550] p 862 N94-15444
High resolution radar profiling using higher-order statistics
[AD-D015891] p 1000 N94-16918
Signal detection in correlated Gaussian and non-Gaussian radar clutter
[AD-A267453] p 1001 N94-17033
Automatic suppression of anomalous propagation clutter for noncoherent weather radars
[KNMI-WR-92-06] p 1004 N94-17407

CMOS
VLSI for high-speed digital signal processing
[AD-A267709] p 1007 N94-14936
The XMM pn-CCD detector system: First results
p 900 N94-15034
A linear monolithic 4-6 on silicon IR detector array
p 910 N94-15098
Fault handling schemes in electronic systems with specific application to radiation tolerance and VLSI design
[NASA-CR-194559] p 1008 N94-15640
Reliability characterization of digital microcircuits: Investigation of an in-process oxide reliability screening method
[AD-A267053] p 1008 N94-15665

COAL
Publications of the Oak Ridge National Laboratory Fossil Energy Program, 1 October 1991 - 31 March 1993
[DE93-014643] p 1232 N94-16967

COAL DERIVED GASES
High octane ethers from synthesis gas-derived alcohols
[DE93-016861] p 975 N94-16898

COAL DERIVED LIQUIDS
Preconversion catalytic deoxygenation of phenolic functional groups
[DE93-017034] p 950 N94-16912
Advanced thermally stable jet fuels
[DE93-017711] p 975 N94-16996

COAL LIQUEFACTION
Advanced thermally stable jet fuels
[DE93-017711] p 975 N94-16996
Supercritical thermodynamics of sulfur and nitrogen species
[DE93-017727] p 1220 N94-16997

COAL UTILIZATION
High octane ethers from synthesis gas-derived alcohols
[DE93-016861] p 975 N94-16898

COALESCING
Bubble coalescence in magmas p 1103 N94-16237

COASTAL CURRENTS
On the application and evaluation of the relocatable diecast ocean circulation model in coastal and semi-enclosed seas
[AD-A266626] p 1112 N94-15771

COASTAL PLAINS
Composite refraction-reflection stack sections: Tracing faults in the Atlantic coastal plain sediments
[DE93-013581] p 1112 N94-16009

COASTAL WATER
Characterization of spatial and temporal variability of phytoplankton blooms in coastal waters
[AD-A267102] p 1116 N94-15633
Preliminary estimates of frequency-direction spectra derived from the SAMSON pressure gage array, November 1990 to May 1991
[AD-A267960] p 1114 N94-17497

COASTAL ZONE COLOR SCANNER
Coastal zone color scanner: Nimbus 7
[NASA-TM-109590] p 1111 N94-15281
Optical properties of the Red Sea
[AD-A266466] p 1113 N94-16588
Atmospheric correction of AVIRIS data in ocean waters p 1070 N94-16690

COASTS
Ventilated oscillatory boundary layers
[AD-A266226] p 1023 N94-16110
Field observations of infragravity, sea and swell directional spectra
[AD-A266439] p 1113 N94-16561

COATING
A new NASA LaRC Multi-Purpose Prepregging Unit
p 932 N94-15276
Effects of aging time on V205 sol-gel coatings
[AD-A266824] p 965 N94-15843
Investigation of the effects of polyelectrolyte coatings on colloid transport in porous media
[DE93-018300] p 970 N94-16973
A state-of-the-art plasma polymerization coater for ICF targets
[DE93-016452] p 1204 N94-17237

COATINGS
The effect of process parameters on the surface finish of plasma polymers
[DE93-014112] p 966 N94-15924
Polished substrate surface and cleaning study for coated optic quality
[DE93-014116] p 1190 N94-15975
Weibull analysis applied to the pull adhesion test and fracture of a metal-ceramic interface
[DE93-012913] p 1059 N94-15997
Investigation of the effects of polyelectrolyte coatings on colloid transport in porous media
[DE93-018300] p 970 N94-16973
Thin composite solid electrolyte film for lithium batteries
[NASA-CASE-NPO-18694-1-CU] p 1014 N94-17325

COAXIAL CABLES
Determination of equivalent circuit for PVDF shock-pressure gauges
[DE93-016492] p 1034 N94-16452

COBALT
Robotic weld overlay coatings for erosion control
[DE93-016938] p 970 N94-16959

COBALT ALLOYS
Dynamical Ising model simulations of nucleation and growth in copper-cobalt alloys
[DE93-015336] p 957 N94-16015

COBALT FLUORIDES
Neutron and x ray scattering studies of (FeF2)(sub m)(CoF2)(sub n) multilayers
[DE93-015809] p 1184 N94-16838

COBALT OXIDES
Siderophile elements in the upper mantle of the Earth: New clues from metal-silicate partition coefficients
p 1103 N94-16250

COCHLEA
Studies of aural acoustic emmissions with the use of an original apparatus and investigative methodology
[IFTR-20/1992] p 1177 N94-16650

COCKPITS
Better way to fly
[NASA-TM-109447] p 866 N94-15396
Basic principles of helicopter crashworthiness
[AD-A267099] p 862 N94-15637

CODE DIVISION MULTIPLE ACCESS
The ELLIPSO (tm) system: Elliptical low orbits for mobile communications p 893 N94-17167

CODING
Rotary encoding device
[NASA-CASE-GSC-13543-1] p 1189 N94-15705
Rotary encoding device
[NASA-CASE-GSC-13556-1] p 1148 N94-15943
Bandwidth efficient coding: Theoretical limits and real achievements. Error control techniques for satellite and space communications p 997 N94-16507
Search for optimal distance spectrum convolutional codes p 998 N94-16509
Discovering sequence similarity by the algorithmic significance method
[DE93-015556] p 1150 N94-16659

COERCIVITY
Magnetic and magneto-optical properties and domain structure of Co/Pd multilayers p 1227 N94-14991

COGNITION
Altitude deviations: Breakdowns of an error-tolerant system
[NASA-TM-108788] p 862 N94-15550
Complex information coordination performance: Differential changes in working memory contributions following training
[AD-A267007] p 1132 N94-15762
Scuba-diving, anxiety and task performance
p 1132 N94-15938

COGNITIVE PSYCHOLOGY
Neural mechanisms of attention
[AD-A266315] p 1132 N94-16456
States of awareness 1: Subliminal perception relationship to situational awareness
[AD-A267249] p 1132 N94-16942
Theoretical and experimental research into biological mechanisms underlying learning and memory
[AD-A267441] p 1133 N94-17022
Processes involved in the integration of pictures and discourse
[AD-A268150] p 1134 N94-17468

COHERENT RADAR
Heterodyne efficiency for a coherent laser radar with diffuse or aerosol targets
[NASA-CR-194563] p 1038 N94-15477
High resolution radar profiling using higher-order statistics
[AD-D015891] p 1000 N94-16918
Remote sensing of precipitation and electrification with a dual-polarization, coherent, wideband radar system
[AD-A267479] p 1004 N94-17364

COHERENT RADIATION
Theoretical studies relating to the interaction of radiation with matter
[AD-A266894] p 1179 N94-14949

COLD CATHODES
Diamond p-n junction cold cathode
[AD-A266926] p 1206 N94-15107

COLD FRONTS
Mesoscale frontogenesis: An analysis of two cold front case studies
[AD-A267950] p 1107 N94-17054
Opposing mesoscale flows in a broken midlatitude squall line
[AD-A268011] p 1109 N94-17492
The Central American cold surge: An observational analysis of the deep southward penetration of North American cold fronts
[AD-A268592] p 1110 N94-17607

COLD WORKING
The influence of secondary bending on fatigue life improvement in bolted joints
[ARL-RR-14] p 1058 N94-15963
Evolution of microstructure in face centered cubic metals during irradiation: A review
[DE93-015682] p 958 N94-16662

COLLAPSE
The size of complex craters p 1262 N94-16249

COLLIMATORS
Test methods for acceptance testing of telescopes
[AD-A268316] p 1237 N94-17568

COLLISION AVOIDANCE
Path planning for robotic truss assembly
[NASA-CR-194652] p 897 N94-17280

COLLISION PARAMETERS
Closed orbit distortion and the beam-beam interaction
[DE93-015284] p 1190 N94-15854

COLLISIONAL PLASMAS
Dynamic behavior of an electric arc gas discharge
[DE93-630197] p 1205 N94-17635

COLLISIONS
Collisional and dynamical history of Gaspra
p 1241 N94-16202
Simulation of collisional fragmentation with explosives
p 1063 N94-16254
Stability analysis for the flow of granular materials down an inclined plane using kinetic model
[DE93-016852] p 1026 N94-16958
Discrete models of the Boltzmann equation: Structure of the collision operator of sound propagation
[IFTR-2/1992] p 1178 N94-17051
Cathode sheath charge transfer effects
[AD-A268393] p 1186 N94-17536

COLLOCATION
Adaptive wavelet collocation methods for initial value boundary problems of nonlinear PDE's
[NASA-CR-191507] p 1169 N94-15833

COLLOIDS
Rheology and microstructure of concentrated zirconia-alumina suspensions for gelcasting composites
[DE93-015339] p 966 N94-16016

Investigation of the effects of polyelectrolyte coatings on colloid transport in porous media
[DE93-018300] p 970 N94-16973
Regulation of attached bacterial growth by adsorbed proteins
[AD-A267756] p 1118 N94-17275

COLOR
Optimum wavelengths for two color ranging p 915 N94-15580
Two color satellite laser ranging upgrades at Goddard's 1.2m telescope facility p 915 N94-15581
Millimeter accuracy satellites for two color ranging p 916 N94-15583
Airborne 2 color ranging experiment p 920 N94-15614
Color separation gratings p 1198 N94-17362
The effects of luminance boundaries on color perception
[AD-A268398] p 1133 N94-17397
Perception of lightness and brightness in complex patterns
[AD-A268435] p 1134 N94-17513

COLOR PHOTOGRAPHY
Global and regional/seasonal color mosaics of Mars p 1288 N94-16393

COLOR TELEVISION
Display system employing acousto-optic tunable filter
[NASA-CASE-NPO-18736-1-CU] p 1190 N94-15933

COLOR VISION
Massively parallel, adaptive, color image processing for autonomous road following
[AD-A266988] p 864 N94-15498
The effects of luminance boundaries on color perception
[AD-A268398] p 1133 N94-17397

COMBAT
Sleep management user's guide for special operations personnel
[AD-A267746] p 1119 N94-14943
Infrared spot tracker
[AD-D015778] p 1191 N94-16547

COMBINATIONS (MATHEMATICS)
New techniques for the combination of heterogenous data when determining the Earth's gravity field
[SER-C-395] p 1098 N94-15153

COMBINATORIAL ANALYSIS
Efficient algorithmic techniques for combinatorial problems
[AD-A267151] p 1172 N94-15777
Combinatorial semantics
[TR-444] p 1149 N94-16575

COMBUSTION
Mechanisms of combustion limits in premixed gas flames at microgravity
[NASA-CR-194557] p 946 N94-15713

COMBUSTION CHAMBERS
Supersonic Combustion Research Laboratory. Volume 1: Design and fabrication
[AD-A267667] p 943 N94-14962
Acoustic waves in complicated geometries and their interactions with liquid-propellant droplet combustion
[AD-A267260] p 1178 N94-16991

COMBUSTION CHEMISTRY
A proposed mechanism for the pyrolysis of diborane
[DE93-014275] p 947 N94-15977
Fundamental studies of rocket combustion chemistry and combustion instability
[AD-A266248] p 925 N94-16482
Gas Analysis System
[DE93-014617] p 949 N94-16891

COMBUSTION CONTROL
Biomass energy: State of the technology present obstacles and future potential
[DE93-016295] p 1092 N94-16766

COMBUSTION EFFICIENCY
Space Shuttle main engine. NASA has not evaluated the alternate fuel turbopump costs and benefits. Report to the Administrator of the National Aeronautics and Space Administration
[GAO/NSIAD-94-54] p 926 N94-16834

COMBUSTION PHYSICS
Rotary engine performance computer program (RCEMAP and RCEMAPPC): User's guide
[NASA-CR-191192] p 869 N94-15192
Clouding tracing: Visualization of the mixing of fluid elements in convection-diffusion systems
[NASA-CR-191529] p 1148 N94-15965
New findings and instrumentation from the NASA Lewis Microgravity Facility p 977 N94-16076
Studies of combustion reactions at the state-resolved differential cross section level
[DE93-017605] p 948 N94-16462
Acoustic waves in complicated geometries and their interactions with liquid-propellant droplet combustion
[AD-A267260] p 1178 N94-16991
Lifted turbulent jet flames
[AD-A267911] p 952 N94-17381
Experimental studies on a gas dynamic laser with narrow throat and high area-ratio grid nozzles
[AD-A267818] p 1042 N94-17400

COMBUSTION PRODUCTS
Scholarly research program in fuel analysis and combustion research
[AD-A266789] p 942 N94-14911
Rocket Motor Plume Technology
[AGARD-LS-188] p 923 N94-15217
Plume primary smoke p 923 N94-15218
Secondary smoke p 924 N94-15220
Rocket motor plume flowfields: Phenomenology and simulation p 924 N94-15221
NASA Operational Environment Team (NOET): NASA's key to environmental technology
[TABES PAPER 93-611] p 1052 N94-16143
Emerging technologies for the changing global market
[TABES PAPER 93-612] p 930 N94-16144
Fundamental studies of rocket combustion chemistry and combustion instability
[AD-A266248] p 925 N94-16482
Biomass energy: State of the technology present obstacles and future potential
[DE93-016295] p 1092 N94-16766
Emissions of volatile organic compounds from stationary combustion sources: Numerical modeling capabilities
[DE93-014123] p 1096 N94-16825
Gas Analysis System
[DE93-014617] p 949 N94-16891
Modeling study to evaluate the ionic mechanism of soot formation in flames
[AD-A266242] p 950 N94-16930
Surface reactivity of combustion generated soot particles
[AD-A268017] p 952 N94-17532

COMBUSTION STABILITY
Fundamental studies of rocket combustion chemistry and combustion instability
[AD-A266248] p 925 N94-16482
Acoustic waves in complicated geometries and their interactions with liquid-propellant droplet combustion
[AD-A267260] p 1178 N94-16991

COMBUSTION SYNTHESIS
Production and evaluation of dense ceramic compounds by combustion synthesis and dynamic compaction
[AD-A266742] p 965 N94-15773

COMET NUCLEI
The physical mechanism of comet outbursts: An experiment p 1242 N94-16221

COMET RENDEZVOUS ASTEROID FLYBY MISSION
Life and the solar system: The CRAF and Cassini missions
[NASA-TM-109422] p 1247 N94-15513

COMETS
Molecular processes in comets
[NASA-CR-194148] p 1239 N94-15188
Life and the solar system: The CRAF and Cassini missions
[NASA-TM-109422] p 1247 N94-15513
The physical mechanism of comet outbursts: An experiment p 1242 N94-16221
Small satellite missions to long-period comets p 874 N94-17144

COMMAND AND CONTROL
Decomposition of large sparse symmetric systems for parallel computation. Part 1: Theoretical foundations
[AD-A267144] p 1159 N94-15750
International testing of a Mars rover prototype p 1273 N94-16312
Not ready for the first space war. What about the second?
[AD-A266557] p 1174 N94-16665
Data processing system for ARSENE ground station: A tool for small satellite control and development p 878 N94-17157
S 80/T: A micro satellite system combining high performances and limited resources p 893 N94-17166
Visual display principles for C3I system tasks
[AD-A267969] p 1005 N94-17498

COMMERCE
Approaching the new reality
[TABES PAPER 93-230] p 1050 N94-16131
Space commerce in a global economy: Comparison of US and Australian approaches
[NASA-TM-109341] p 1235 N94-17290

COMMERCIAL AIRCRAFT
Criminal acts against civil aviation, fiscal year 1992
[AD-A268014] p 863 N94-17586

COMMERCIAL ENERGY
Energy from the sun: Evolution of federal support for solar energy
[AD-A267944] p 1093 N94-17382

COMMINUTION
Dynamic testing and characterization of pre-fractured ceramic
[DE93-016457] p 972 N94-17238

COMMUNICATION EQUIPMENT
Operation of digital systems in severe electromagnetic environments
[AD-A267176] p 988 N94-15693
Satellite communications installation plan
[AD-A266303] p 1000 N94-16965
Ground wave emergency network final operational capability: Environmental assessment for central Nevada relay node, site number RN 8W917NV
[AD-A267630] p 1002 N94-17200
Ground wave emergency network final operational capability: Environmental assessment for southern Nevada relay node site number RN 8W918NV
[AD-A267647] p 1002 N94-17205
Ground wave emergency network final operational capability: Environmental assessment for northwestern Nebraska relay node, site number RN 8C930NE
[AD-A267629] p 1003 N94-17212
Ground wave emergency network environmental assessment for northwestern Colorado relay node site number RN 8C924CO
[AD-A267654] p 1003 N94-17249

COMMUNICATION NETWORKS
The Third Annual NASA Science Internet User Working Group Conference
[NASA-CP-3170] p 1228 N94-15116
Electronic messaging for the 1990's
[AD-A267143] p 1229 N94-15437
Multiphase complete exchange: A theoretical analysis
[NASA-CR-191531] p 1145 N94-15489
Overview of Enhanced Data Stream Array Processor (EDSAP)
[AD-A266986] p 1158 N94-15492
Congestion control of high-speed networks
[AD-A267013] p 989 N94-15748
Logarithmic asymptotics for steady-state tail probabilities in a single-server queue
[AD-A266746] p 1165 N94-15775
Department of Defense technical architecture framework for information management. Volume 3: Architecture concepts and design guidance, version 2.0
[AD-A267195] p 1230 N94-15789
Data distribution p 993 N94-15910
Remote diagnosis as used for mechanized parking systems p 984 N94-16004
Performance Information Management System (PIMS) communication
[AD-A267040] p 1231 N94-16458
Consistent failure reporting in reliable communication systems
[AD-A266298] p 997 N94-16477
Information technology division technical paper abstracts
[AD-A266227] p 1166 N94-16938
A formal protocol test procedure for the Survivable Adaptable Fiber Optic Embedded Network (SAFENET)
[AD-A267410] p 1192 N94-16975
Ground wave emergency network final operational capability: Environmental assessment for central Wyoming relay node, site number RN 8C928WY
[AD-A267842] p 1001 N94-17011
Low Earth orbit constellations: Orbit control or not p 875 N94-17134
Impact of launching uncertainties on the visibility of communication satellite constellations without orbit control p 889 N94-17135
A study on an experimental communication system using microsatellites p 892 N94-17160
Feasibility study of a personal communications system IRIDIUM-like p 893 N94-17165
Ground wave emergency network final operational capability: Environmental assessment for central Utah relay node, site number RN 8C920UT
[AD-A267628] p 1003 N94-17211
Ground wave emergency network. Final operational capability. Environmental assessment for southeastern Idaho relay node, site no. RN8W927ID
[AD-A267796] p 1003 N94-17304
Non-blocking crossbar permutation engine with constant routing latency
[NASA-CASE-NPO-18864-1-CU] p 1161 N94-17328
A scalable wrap-around shuffle exchange network with deflection routing
[NASA-CASE-NPO-18983-1-CU] p 1161 N94-17330
Ground wave emergency network final operational capability. Environmental assessment for southern Arkansas relay node site no. RN 8C912AR
[AD-A268001] p 1004 N94-17376
Environmental assessment for northwestern Indiana relay node site no. RN 8C902IN
[AD-A267849] p 1004 N94-17406

A protocol validator for the SCM and CFSM models
[AD-A268523] p 1156 N94-17541

COMMUNICATION SATELLITES

Activities of Canadian Satellite Communications, Inc.
[CTN-93-60864] p 994 N94-15959

Olympus propagation measurement results at Virginia Tech p 995 N94-16037

Data acquisition, preprocessing and analysis for the Virginia Tech OLYMPUS experiment p 995 N94-16038

Comparison of OLYMPUS beacon and radiometric attenuation measurements at Blacksburg, Virginia p 996 N94-16046

Satellite sound broadcast propagation measurements p 996 N94-16047

The early development of the Telecommunications Satellite Programme in ESRO (1965-1971)
[ESA-HSR-9] p 887 N94-16525

Small satellite constellation system: Optimization criteria p 888 N94-17132

Impact of launching uncertainties on the visibility of communication satellite constellations without orbit control p 889 N94-17135

Small satellite constellation deployment strategies p 878 N94-17138

Adequation of mini satellites to oceanic altimetry missions p 891 N94-17152

Satellite control: A comprehensive approach p 878 N94-17158

Regulation of low Earth orbit satellites p 892 N94-17159

Feasibility study of a personal communications system IRIDIUM-like p 893 N94-17165

STARSYS: A view after WARC-92 --- satellite position and messaging system p 893 N94-17168

UoSAT: A decade of experience pioneering microsatellites p 894 N94-17169

Arsene GaAs solar array p 894 N94-17174

The STRV On Board Data Handling (OBDH) system: An introduction p 895 N94-17178

Standard platforms for small satellites p 895 N94-17181

Big results with small space systems: What small systems are doing today p 896 N94-17187

Key trends of the small satellite market p 897 N94-17191

Military satellite communications: Opportunity to save billions of dollars. Report to the Chairman, Legislation, and National Security Subcommittee, Committee on Government Operations, House of Representatives
[AD-A267627] p 1002 N94-17199

On-board packet switch architectures for communication satellites
[NASA-TM-106328] p 883 N94-17488

Satellite communications systems and technology. Executive summary
[NASA-TM-109346] p 1006 N94-17661

COMPACTING

Verification of a two-dimensional infiltration model for the resin transfer molding process
[NASA-CR-194597] p 964 N94-15656

Production and evaluation of dense ceramic compounds by combustion synthesis and dynamic compaction
[AD-A266742] p 965 N94-15773

COMPETITION

The NASA competitive placement plan for positions GS-15 and below (including trades and labor positions)
[NHB-3335.1C] p 1224 N94-15944

COMPILERS

Concurrent garbage collection of persistent heaps
[AD-A266831] p 1141 N94-14915

Applicability of the session and the presentation layers for the support of high speed applications
[INRIA-RT-144] p 1158 N94-14980

Evaluation of ALSYS 037 Ada Compiler
[AD-A266972] p 1143 N94-15110

The application of compiler-assisted multiple instruction retry to VLIW architectures
[AD-A266930] p 1158 N94-15173

Efficient compilation of array statements for private memory multicomputers
[AD-A266595] p 1160 N94-16724

Detailed example of using ACEC release 3.0 with the DEC VAX Ada compiler
[AD-A267880] p 1152 N94-17014

COMPLEX COMPOUNDS

High-valent oxo, methoxorhenium complexes: Models for intermediates and transition states in proton-coupled multi-electron transfer reactions
[AD-A266492] p 1211 N94-16782

Synthesis, reactivity, and characterization of (-hexacarbocyclic) manganese dicarbonyl complexes with sulfur and phosphorus ligands
[AD-A267592] p 930 N94-17192

Synthesis, characterization, and polymerization of new ferrocene-fluorene complexes. A novel high-molecular weight conjugated polymer with pendant ferrocene groups
[AD-A267717] p 972 N94-17273

COMPLEX SYSTEMS

Multiobjective functions optimization for task allocation mapping to multicomputer nodes
[AD-A267071] p 1146 N94-15670

Development of pattern recognition techniques for the evaluation of toxicant impacts to multispecies systems
[AD-A267197] p 1095 N94-15790

A modular control architecture for real-time synchronous and asynchronous systems
[DE93-015439] p 1166 N94-16888

Speckles statistics and decorrelation effects in complex ABCD optical systems
[AD-A267843] p 1193 N94-17012

COMPLEX VARIABLES

Closed form characteristic function for general complex second-order form in correlated complex Gaussian random variables
[AD-A267883] p 1171 N94-17393

COMPONENT RELIABILITY

The design of self-checking reduced instruction set computers
[AD-A267012] p 1140 N94-15763

Reduction of parasitic lasing
[NASA-CASE-LAR-14645-1-SB] p 1039 N94-15942

COMPOSITE MATERIALS

Production Technology for Components from Nonmetallic Fiber Reinforced Materials
[ETN-93-94607] p 931 N94-15254

Production process p 931 N94-15257

Machine development p 932 N94-15258

Component testing and quality assurance p 932 N94-15259

Development of a computer supported instrumentation for economic planning and evaluation of production facilities for fiber reinforced composites elements p 932 N94-15260

Processing, properties and applications of composites using powder-coated epoxy towpreg technology p 933 N94-15277

Better airplane wings
[NASA-TM-109446] p 933 N94-15345

Illustrated glossary of textile terms for composites
[NASA-CR-191539] p 933 N94-15484

Method and apparatus for non-destructive evaluation of composite materials with cloth surface impressions
[NASA-CASE-LAR-14535-1] p 933 N94-15878

On the design of structural components using materials with time-dependent properties
[NASA-TM-108428] p 1059 N94-16519

An overview of the NASA textile composites program p 937 N94-16846

Techno-economic requirements for automotive composites p 937 N94-16847

Fibers and materials of medical application p 938 N94-16855

Techno-economic requirements for composite aircraft components p 940 N94-16864

Influence of the loading rate on the endurance and deformability of cement matrix composites
[IFTR-1/1992] p 1060 N94-17052

Fabrication of piezoelectric ceramic/polymer composites by injection molding
[AD-A267302] p 972 N94-17227

Thin composite solid electrolyte film for lithium batteries
[NASA-CASE-NPO-18694-1-CU] p 1014 N94-17325

COMPOSITE STRUCTURES

Dynamic behavior of fiber and particle reinforced composites
[AD-A266905] p 930 N94-15143

Better airplane wings
[NASA-TM-109446] p 933 N94-15345

Progress in the modeling of the shock response and mitigation of thick composite shells
[AD-A267009] p 1057 N94-15524

High temperature advanced structural composites. Volume 2: Ceramic matrix composites, fiber processiing and properties, and interfaces
[AD-A267023] p 933 N94-15528

High temperature advanced structural composites. Volume 3: Mechanics
[AD-A267024] p 933 N94-15626

Center for Rotorcraft Education and Research progress report, 1987 - 1992
[AD-A266760] p 857 N94-15824

High temperature advanced structural composites. Volume 1: Executive summary and intermetallic compounds
[AD-A267022] p 933 N94-15835

Improved composite flexible blanket insulation
[NASA-CASE-ARC-11955-1-CU] p 934 N94-15926

Slidesurfaces with: adaptive new definitions (SAND) for transient analysis
[DE93-014909] p 1059 N94-15983

On the design of structural components using materials with time-dependent properties
[NASA-TM-108428] p 1059 N94-16519

FIBER-TEX 1992: The Sixth Conference on Advanced Engineering Fibers and Textile Structures for Composites
[NASA-CP-3211] p 936 N94-16845

Thin composite solid electrolyte film for lithium batteries
[NASA-CASE-NPO-18694-1-CU] p 1014 N94-17325

Structural mechanics division research and technology accomplishments for CY 1992 and plans for CY 1993
[NASA-TM-107752] p 1062 N94-17479

COMPOSITE WRAPPING

Production process p 931 N94-15257

Machine development p 932 N94-15258

COMPRESSED GAS

Inflatable rescue device
[NASA-CASE-MSC-22244-1] p 1137 N94-15883

Transmission of light through a turbulent mixing layer
[AD-A267266] p 1193 N94-17264

COMPRESSIBILITY

The processing and mechanical properties of high temperature/high performance composites. Book 5: Processing and miscellaneous properties
[AD-A266398] p 935 N94-16529

COMPRESSIBILITY EFFECTS

Turbulence modelling for shock wave/boundary layer interactions specific issues and examples of applications p 1018 N94-15202

COMPRESSIBLE BOUNDARY LAYER

Tollmien-Schlichting/vortex interactions in compressible boundary layer flows
[NASA-CR-191515] p 1017 N94-15183

Higher-order accurate Osher schemes with application to compressible boundary layer stability
[NASA-TM-106355] p 1026 N94-17056

COMPRESSIBLE FLOW

Large-Eddy Simulations (LES) of flows and turbulence distribution
[AD-A267182] p 1016 N94-15151

Turbulence modelling for shock wave/boundary layer interactions specific issues and examples of applications p 1018 N94-15202

Proteus two-dimensional Navier-Stokes computer code, version 2.0. Volume 2: User's guide
[NASA-TM-106338-VOL-2] p 1019 N94-15475

Proteus two-dimensional Navier-Stokes computer code, version 2.0. Volume 1: Analysis description
[NASA-TM-106336-VOL-1] p 1019 N94-15485

Proteus three-dimensional Navier-Stokes computer code, version 1.0. Volume 2: User's guide
[NASA-TM-106340-VOL-2] p 1020 N94-15488

Proteus three-dimensional Navier-Stokes computer code, version 1.0. Volume 3: Programmer's reference
[NASA-TM-106341] p 1022 N94-15865

Proteus two-dimensional Navier-Stokes computer code, version 2.0. Volume 3: Programmer's reference
[NASA-TM-106339] p 1022 N94-15867

Proteus three-dimensional Navier-Stokes computer code, version 1.0. Volume 1: Analysis description
[NASA-TM-106337] p 1024 N94-16527

Numerical study of compressible boundary-level transition between two concentric cylinders
[NASA-CR-194622] p 1025 N94-16842

Adaptive Cartesian grid methods for representing geometry in inviscid compressible flow
[DE93-016430] p 1025 N94-16894

Three dimensional hydrodynamic calculations with adaptive mesh refinement of the evolution of Rayleigh Taylor and Richtmyer Meshkov instabilities in converging geometry: Multi-mode perturbations
[DE93-017155] p 1025 N94-16903

On solving the compressible Navier-Stokes equations for unsteady flows at very low Mach numbers
[NASA-TM-106380] p 1027 N94-17128

Development of iterative techniques for the solution of unsteady compressible viscous flows
[NASA-CR-194657] p 1027 N94-17129

Compressible flow solvers using unstructured grids
[INRIA-RR-1732] p 1030 N94-17531

COMPRESSION RATIO

Jet engine performance enhancement through use of a wave-rotor topping cycle
[NASA-TM-4486] p 870 N94-17470

COMPRESSION TESTS

Experimental study of nonassociated flow and instability of frictional materials
[AD-A266421] p 1024 N94-16555

Development of test methods for textile composites p 939 N94-16862

Static and dynamic investigations of brittle elasto-optical material
[IFTR-3/1992] p 1061 N94-17086
COMPRESSION WAVES
The seismic response of an aquifer to the propegation of an impact generated shock wave: A possible trigger of the Martian outflow channels? p 1281 N94-16354
Shear wave measurements in shock-induced, high-pressure phases
[DE93-016461] p 1062 N94-17664
COMPRESSIVE STRENGTH
Simulation studies for surfaces and materials strength
[NASA-CR-193387] p 1056 N94-15004
Mechanical properties of magnesium ammonium phosphate cements and their zeolite composites
[DE93-015155] p 934 N94-16057
Effect of Impact Damage and Open Hole on Compressive Strength of Hybrid Composite Laminates
[NASA-CR-194603] p 936 N94-16836
Dynamic testing and characterization of pre-fractured ceramic
[DE93-016457] p 972 N94-17238
COMPRESSOR BLADES
Determining the effect of endwall boundary layer suction in a large scale subsonic compressor cascade
[AD-A267208] p 859 N94-16913
COMPUTATION
A formal language for the specification and verification of synchronous and asynchronous circuits
[NASA-CR-191509] p 1144 N94-15443
Decomposition of large sparse symmetric systems for parallel computation. Part 2: Parallelization tool roadmap
[AD-A267072] p 1158 N94-15671
A scientific basis for computational science
[AD-A266697] p 1148 N94-15841
Efficient computational methods to study new and innovative signal detection techniques in SETI
[NASA-CR-193602] p 998 N94-16649
COMPUTATIONAL CHEMISTRY
Continuum solvent models for computational chemistry
[DE93-016329] p 953 N94-17660
COMPUTATIONAL FLUID DYNAMICS
Large-Eddy Simulations (LES) of flows and turbulence distribution
[AD-A267182] p 1016 N94-15151
Swept shock wave/laminar boundary layer interactions, experimental, and numerical results
p 1017 N94-15198
Numerical simulation of 3-D shock wave turbulent boundary layer interactions p 1017 N94-15199
Unsteady phenomena in shock wave/boundary layer interaction p 1017 N94-15200
Hypersonic shock wave boundary layer interactions over simplified deflected control surface configurations
p 1018 N94-15203
Rocket motor plume flowfields: Phenomenology and simulation p 924 N94-15221
The 1989 computational fluid dynamics highlights
[NASA-TM-109635] p 1018 N94-15246
The 1988 computational fluid dynamics highlights
[NASA-TM-109645] p 1019 N94-15431
Proteus two-dimensional Navier-Stokes computer code, version 2.0. Volume 2: User's guide
[NASA-TM-106338-VOL-2] p 1019 N94-15475
Proteus two-dimensional Navier-Stokes computer code, version 2.0. Volume 1: Analysis description
[NASA-TM-106336-VOL-1] p 1019 N94-15485
Proteus three-dimensional Navier-Stokes computer code, version 1.0. Volume 2: User's guide
[NASA-TM-106340-VOL-2] p 1020 N94-15488
Numerical investigations in three-dimensional internal flows
[NASA-CR-194594] p 1020 N94-15551
Particle kinetic simulation of high altitude hypervelocity flight
[NASA-CR-194599] p 856 N94-15678
On the application and evaluation of the relocatable diecast ocean circulation model in coastal and semi-enclosed seas
[AD-A266626] p 1112 N94-15771
User's manual for the HYPGEN hyperbolic grid generator and the HGUI graphical user interface
[NASA-TM-108791] p 1148 N94-15784
NAS technical summaries: Numerical aerodynamic simulation program, March 1991 - February 1992
[NASA-TM-109335] p 854 N94-15798
Modal element method for potential flow in non-uniform ducts: Combining closed form analysis with CFD
[NASA-TM-106347] p 1169 N94-15799
On the stability analysis of approximate factorization methods for 3D Euler and Navier-Stokes equations
[NASA-TM-106314] p 1169 N94-15818
Proteus three-dimensional Navier-Stokes computer code, version 1.0. Volume 3: Programmer's reference
[NASA-TM-106341] p 1022 N94-15865
Proteus two-dimensional Navier-Stokes computer code, version 2.0. Volume 3: Programmer's reference
[NASA-TM-106339] p 1022 N94-15867
Clouding tracing: Visualization of the mixing of fluid elements in convection-diffusion systems
[NASA-CR-191529] p 1148 N94-15965
Effects of rotation on coolant passage heat transfer. Volume 2: Coolant passages with trips normal and skewed to the flow
[NASA-CR-4396-VOL-2] p 1023 N94-15991
Aerodynamic/dynamic/control interaction
[AD-A266187] p 871 N94-16107
Implementation of an anisotropic turbulence model in the COMMIX-1C/ATM computer code
[DE93-015541] p 1023 N94-16444
Computation of the Fluid and Optical Fields About the Stratospheric Observatory for Infrared Astronomy (SOFIA) and the Coupling of Fluids, Dynamics, and Control Laws on Parallel Computers
[NASA-CR-193168] p 858 N94-16510
Proteus three-dimensional Navier-Stokes computer code, version 1.0. Volume 1: Analysis description
[NASA-TM-106337] p 1024 N94-16527
Flow analysis for the nacelle of an advanced ducted propeller at high angle-of-attack and at cruise with boundary layer control
[NASA-TM-106371] p 858 N94-16571
Applications and development of communication models for the touchstone GAMMA and DELTA prototypes
[NASA-CR-193617] p 999 N94-16867
Computation of confined coflow jets with three turbulence models
[NASA-TM-106378] p 1025 N94-16879
Accurate upwind methods for the Euler equations
[NASA-TM-106388] p 1170 N94-16882
Three-dimensional turbulent boundary layer
[AD-A266261] p 1025 N94-16908
An upwind multigrid method for solving viscous flows on unstructured triangular meshes
[NASA-TM-109343] p 1027 N94-17061
Computational aerodynamics with icing effects
[AD-A267509] p 860 N94-17074
Progress in computational unsteady aerodynamics
[NASA-CR-177630] p 860 N94-17081
Investigation of high-speed free shear flows using improved pressure-strain correlated Reynolds stress turbulence model
[NASA-CR-194661] p 1027 N94-17127
On solving the compressible Navier-Stokes equations for unsteady flows at very low Mach numbers
[NASA-TM-106380] p 1027 N94-17128
Development of iterative techniques for the solution of unsteady compressible viscous flows
[NASA-CR-194657] p 1027 N94-17129
Studies on nonequilibrium phenomena in supersonic chemically reacting flows
[NASA-CR-194662] p 1027 N94-17215
Multigrid time-accurate integration of Navier-Stokes equations
[NASA-TM-106373] p 1028 N94-17258
Active turbulence control in wall bounded flows using direct numerical simulation
[AD-A267261] p 1028 N94-17286
Experimental and computational investigation of the NASA low-speed centrifugal compressor flow field
[NASA-TM-4481] p 869 N94-17386
Structured finite volume modeling of US Navy aircraft engine test cells task 2: Turboprop engine, volume 1
[AD-A267833] p 872 N94-17405
Computational analysis of Variable Thrust Engine (VTE) performance
[NASA-CR-193852] p 928 N94-17442
Boundary conditions and the simulation of low Mach number flows
[NASA-TM-106374] p 1029 N94-17448
Single block three-dimensional volume grids about complex aerodynamic vehicles
[NASA-TM-108986] p 1030 N94-17476
Compressible flow solvers using unstructured grids
[INRIA-RR-1732] p 1030 N94-17531
A domain-partition method for the advection-diffusion equation
[INRIA-RR-1740] p 1030 N94-17534
Multigrid direct numerical simulation of the whole process of flow transition in 3-D boundary layers
[NASA-TM-106369] p 1030 N94-17557
Thin-layer and full Navier-Stokes calculations for turbulent supersonic flow over a cone at an angle of attack
[NASA-CR-189103] p 861 N94-17558
Structured finite volume modeling of US Navy aircraft engine test cells. Task 2: Turboprop engine. Volume 2: Code documentation and listings
[AD-A268386] p 873 N94-17569
Study into the limits of an Euler equation method applied to leading-edge vortex flow
[NLR-TP-91350-U] p 1031 N94-17627
COMPUTATIONAL GEOMETRY
Efficient algorithmic techniques for combinatorial problems
[AD-A267151] p 1172 N94-15777
Towards dynamic randomized algorithms in computational geometry
[INRIA-RR-1727] p 1156 N94-17528
Construction of d-dimensional hyperoctrees on a hypercube multiprocessor
[INRIA-RR-1752] p 1162 N94-17539
COMPUTATIONAL GRIDS
A parallel adaptive mesh refinement algorithm
[NASA-CR-191530] p 1168 N94-15724
Modal element method for potential flow in non-uniform ducts: Combining closed form analysis with CFD
[NASA-TM-106347] p 1169 N94-15799
Design of round-to-square transition section; analysis and computer code
[AD-A267173] p 872 N94-15847
A detailed model for simulation of catchment scale subsurface hydrologic processes
[PAPER-92WR02333] p 1084 N94-16032
Adaptive algorithm for aircraft configuration in turbulent flow
[AD-A266188] p 867 N94-16122
Modal ring method for the scattering of sound
[NASA-TM-106342] p 1177 N94-16497
Adaptive Cartesian grid methods for representing geometry in inviscid compressible flow
[DE93-016430] p 1025 N94-16894
Three dimensional hydrodynamic calculations with adaptive mesh refinement of the evolution of Rayleigh Taylor and Richtmyer Meshkov instabilities in converging geometry: Multi-mode perturbations
[DE93-017155] p 1025 N94-16903
An upwind multigrid method for solving viscous flows on unstructured triangular meshes
[NASA-TM-109343] p 1027 N94-17061
Linear characteristic spatial quadrature for discrete ordinates neutral particle transport on arbitrary triangles
[AD-A267485] p 1185 N94-17365
Single block three-dimensional volume grids about complex aerodynamic vehicles
[NASA-TM-108986] p 1030 N94-17476
Numerical solution of a second order boundary problem for two dimensions using galerkin approximations
[AD-A268128] p 1171 N94-17521
Compressible flow solvers using unstructured grids
[INRIA-RR-1732] p 1030 N94-17531
Multigrid direct numerical simulation of the whole process of flow transition in 3-D boundary layers
[NASA-TM-106369] p 1030 N94-17557
Thin-layer and full Navier-Stokes calculations for turbulent supersonic flow over a cone at an angle of attack
[NASA-CR-189103] p 861 N94-17558
The photonical, pure grid method
[NLR-TP-91478-U] p 1062 N94-17600
COMPUTER AIDED DESIGN
A CENTAUR tutorial
[INRIA-RT-140] p 1142 N94-14978
Gratings and waveguides p 1226 N94-14987
Geometric tolerance assessment
[NPL-DITC-210/92] p 1049 N94-15013
Open environments to support systems engineering tool integration: A study using the Portable Common Tool Environment (PCTE)
[NASA-TM-4489] p 1144 N94-15486
RAMCAD design methodology
[AD-A267010] p 1145 N94-15525
An assessment of finite-element modeling techniques for thick-solid/thin-shell joints analysis
[NASA-TM-108426] p 1058 N94-15534
The free decay of coupled heave and pitch motions of a model frigate
[DRA/TM(AWMH)92340] p 1146 N94-15702
Using interactive sketch interpretation to design solid objects
[AD-A266637] p 1147 N94-15743
